The Nation.

NEW YORK, THURSDAY, JANUARY 3, 1878.

The Week.

THE old year has closed, as it opened, in much doubt and misgiving, both in politics and business. The Presidential difficulty, which weighed on everybody's mind on the first of last January, was happily cleared away, and has been succeeded by the Silver movement, which nobody at that time anticipated, but which we cannot help believing will also pass by with less damage than many people now fear. The glowing anticipations with which many good souls fed their fancy about Mr. Hayes during the canvass have been supplanted by many depressing realities, but then it may be safely said to these excitable persons, that just as they were then mistaken in their elation they are now mistaken in their depression. He is now in the midst of the inevitable reaction, but it too will pass. Under the financial and political confusion which has marked the surface of affairs business has been slowly, very slowly it is true, recovering; the South has been pacified; it is not yet a model community, but life and property, including the wages of labor, are safer in it than they have been since the Revolution. The horrible corruption of the carpet-bag period has ceased, but it has unhappily been succeeded by a repudiation mania which promises to ruin the credit of those States for fifty years to come, and make them Federal beggars for all their internal improvements. Last January, Russia had just begun to threaten Turkey, and most people expected a feebler resistance and stronger attack, but the end now in plain view is what all anticipated—the virtual expulsion of the Turks from the European family of nations, to which they should never have been admitted, and the virtual extinction of their Empire, which has probably been the cause of more human misery than all other political evils put together during the last four hundred years. France has passed through a crisis which was utterly unexpected, and which, for a while, threatened the present form of government with ruin, but has ended by strengthening it enormously. In other quarters the old year has been one of unusual tranquillity. It is safe to say that on the whole it has been one of solid advance in civilization, for civilization comes not less through rude awakenings and undeceivings than through solid achievement. There seems nothing but the overthrow of the silver swindle needed for our entrance on several years at least of healthy prosperity.

The old year has left us a new form of fraud, which goes by the fine name of "rehypothecation," repledging being too common for the purpose. This linguistic ornamentation of rascality has become very common and amusing. To "scale a debt," or "readjust" it, means to cheat a creditor out of some part of what you owe him in any case in which he has no legal protection; to "remonetize silver," or "bring back the dollar of your fathers," means to cheat your creditor out of ten per cent., while apparently paying him the full amount due to him. This last is, however, the only case in which knavery is covered with a veil of sentiment. We may remark, while on this topic, that no advocates of the silver fraud are so repulsive as the ministers and religious editors who have taken it up, as many have done in the West, and probably none so mischievous, because they appear to make the movement all right on its moral or hinder part, while the "laics" are quibbling and lying out in front over "the finance" of it. None of their articles which have come under our notice, however, reveal even an imperfect knowledge of the subject, while the ethics of them look as if the authors had studied ethics in other worlds than ours.

Mr. Wm. E. Chandler, of New Hampshire, one of the most active of the Republican managers during the late Presidential count, has furnished the principal political topic of the week, in the shape of a long and elaborate attack on President Hayes, in a letter addressed to "the Republicans of New Hampshire." Mr. Chandler is not a great statesman, or a man to be much respected from any point of view, but he is undoubtedly an adroit and unscrupulous politician, and what he says is worth attention as a pretty good indication of what all the machine-men are thinking or intending. That he is not easily satisfied about the South may be inferred from the fact that after making a terrible uproar about Southern "outrages" on negroes before the late Presidential election, on finding after the withdrawal of the troops that the outrages had ceased, he declared that "to the thoughtful man" the absence of outrages was far more alarming and suggestive than their frequency, which drew from the Springfield *Republican* the very just observation—"What an ass Bill Chandler is!" The substance of "Bill's" accusation against Mr. Hayes is that he was distinctly nominated and elected as a "bloody-shirt" candidate; that he so understood it himself, as was shown in his letter of acceptance and the letter he wrote Nov. 8, when he thought he had been defeated, deploring the fate of the poor negro under Tilden. Chandler further truly remarks that the "campaign was carried on, as far as methods and utterances were concerned, in no respects differently from the campaigns of 1868 and 1872"; "the 'bloody shirt,' as it is termed, was freely waved, and Governor Hayes himself urged prominent public men to put forward as our best argument the dangers of a rebel rule and solid South." We shall only observe on this that, if Chandler and his kind had their way, the campaign of 1896, or even of 1916, would also be conducted "in no respects differently from the campaigns of 1868 and 1872."

He then goes on to show that this understanding was adhered to faithfully in the dealings of the Republican party with the Returning Boards, in which, we may add, Chandler himself was a prime mover. What these were in Louisiana he relates in a passage so remarkable for shamelessness and audacity that we reproduce it entire:

"In Louisiana, however, there had been thrown into the ballot boxes over 7,000 more votes for the Tilden than for the Hayes electors, and to make Hayes President it became necessary for the Returning Board, acting under peculiar local laws, to throw out more than 7,000 Tilden votes on account of alleged murder, riot, and intimidation preventing a fair and free election in certain parishes. To perform this extraordinary, even if justifiable, work in the face of an armed and infuriated Democracy, required men of undaunted courage; and such courage the Returning Board possessed. It required, also, that the Board should have assurances that the national exigency demanded its performance; that the moral sentiment of the North would approve it, and that they themselves should be protected from evil consequences to be apprehended from the violence of a mob government, which it was known would be established by one Nicholls, a pretender to the office of Governor against Stephen B. Packard, who was sure to be found elected Governor if the Hayes electors should be found to have been chosen."

He therefore accuses the President of a gross breach of faith. When one considers the character of the men composing the Returning Board from whom this "courage" was required, one has no difficulty in believing that they would have thrown out not 7,000 only, but 50,000, had "the national exigency required it." We recall nothing at this moment in political literature more impudent than the foregoing, and shall take leave of "Bill" and his revelations with the remark that Mr. Sherman denies, for himself and his associates of the Grant Commission, that there is any truth in Chandler's charge that they gave the Returning Board the assurances needed to keep up its "courage."

The Tennessee Legislature has adjourned without making any provision for the payment of the State debt, and Tennessee politics for some time to come seem likely to turn on repudiation, pure and simple. During the session a resolution was offered by Mr. Kindrick, a representative from Roane County, insisting that it was in-

compatible with the honor of the State to propose a compromise to its creditors, that any proposition they might make ought to be immediately accepted and faithfully carried out, and that no compromise should bind creditors not consenting to it. This resolution was laid on the table by a vote of 40 to 27, the vote in the affirmative being made up of 39 Democrats and 1 Republican. It is stated by the Knoxville *Chronicle* that only three East-Tennesseeans voted with the Repudiationists. Indeed, this division between the "State credit" party and the Repudiation party seems to be very much the same as between Republicans and Democrats. It would be difficult to exaggerate the infamy of which the Tennessee Legislature has been guilty. The State is rich and able to pay, but it is easier not to doso. In Virginia, on the other hand, Governor Holliday has taken strong and unequivocal ground in his inaugural in favor of maintaining the State credit unimpaired, and predicts "woe to the man" who, in the settlement of her obligations, "betrays the trust or sells the honor of Virginia."

Mr. H. V. Redfield, the well-known correspondent of the Cincinnati *Commercial*, has got hold of some of the late Andrew Johnson's private papers and has published many of the letters received by him when President. Most of them possess no special interest in themselves, but taken together they afford an illustration of the sort of "pressure" that the President is now subjected to, and may be taken probably as types of the letters which Mr. Hayes is now receiving. Many of them are office-begging letters—one from J. Madison Wells, of Louisiana, who in 1865 sends word to the President as follows: "I deem it the interest of Louisiana that I should be appointed Provisional Governor," and adds thoughtfully that "a uniform system of reorganization" is "nationally indispensable." Fernando Wood telegraphs April 5, 1867, to the President's secretary: "If I cannot have O'Callaghan and Dana, I want O'Callaghan and Thomas." Again, we find Amos Layman, who signs himself as "Editor Ohio *Statesman*," telegraphing that one Reid Johnson, "Congressional candidate for Mansfield district," wants one Glissner appointed postmaster "before the election." February 10, 1868, General Steedman suggests that Mr. Johnson "issue an order assuming personal command of the army and navy." June 18, 1867, W. H. C. King notifies the President from New Orleans that if given the Mexican mission, which the "urgency of friends" had determined him to ask for, he could leave at three hours' notice in a revenue cutter "which the Collector says he can place at my disposal." The mass of applications and recommendations brings out in a striking way what we suppose will form part of the grounds of Mr. Hayes's promised message to Congress on civil-service reform: the absolute necessity of taking off the President's shoulders the responsibility for the appointment of officials whose qualifications he cannot examine into, and the "urgency" of whose friends now exhausts nine-tenths of his time.

The Commissioners appointed by the Secretary of the Treasury to examine into the management of the Bureau of Statistics made a report, dated October 15, 1877, showing a scandalous state of facts. The Commission consisted of three Government officials, selected by Mr. Sherman especially for the work, and their report is therefore not open to the charge of partisanship. They show that Government publications, prepared at the public expense, were sold by the son of Dr. Young, the chief of the Bureau, the proceeds being pocketed by him; that private editions of such publications were printed by the doctor for his own benefit, certain corporations having made private arrangements with him in the enterprise with a view to profit on both sides; that the doctor used his time, paid for by the Government, for private business, privately paid. Out of a variety of improper transactions of this sort Dr. Young's son made money enough to take a European trip. In 1872 the doctor received as Government delegate to the International Statistical Congress at St. Petersburg, in addition to his regular salary of $2,500 for the whole year, $18 51 per diem for the time so employed, and, not satisfied with this, was paid other sums by English and American merchants; and he admitted that there were "some other parties who contributed to the expenses of my [his] family." Another little venture of his was a volume called 'Labor in Europe and America,' printed by the Government, but sold by Dr. Young for his private emolument. Altogether the report is a disgraceful exposure, and why it has not been followed by some action on the part of the Government is a mystery.

The Cincinnati *Gazette* propounds the painful enquiry whether Mr. Murat Halstead, the editor of the *Commercial* and one of the leading silver agitators, is insane. It points out that the beginning of insanity is monomania—*i.e.*, the bent of the mind to a single idea, the continual dwelling on one subject until the person affected becomes incapable of estimating the true relation of things. At first this is attended with a certain degree of rationality in other matters, but in time the reason is completely unsettled at all points. The *Gazette* then proceeds to trace these symptoms in Mr. Halstead's paper, showing that whereas it formerly had a cool, cynical tone, and treated subjects sometimes even with levity, always avoiding a tedious iteration of the same arguments, it has become characterized since it went into the silver movement by a marked seriousness, and a repeated and strenuous iteration of the belief that the safety of the country, its emancipation from debt, its material prosperity, its good morals, and the preservation of its religion hang on one thing—the restoration of the silver dollar. Another symptom which is alarming is the effect of remonstrances and arguments addressed to his reason. These only excite him to further insistance upon the truth of his hallucination, and arouse also his anger—a usually pretty sure sign—and produce further iteration until (we think this must be a Western exaggeration) he publishes "from twelve to sixteen articles every day" on silver. Moreover, there is not wanting an almost unfailing symptom—that of suspicion. With a mind diseased in this way there always exists an hallucination that the world is in league against the patient, and conspiring against him; and accordingly we find poor Mr. Halstead loudly exposing the designs of the British bullionists, the fraudulent secrecy by which the Coinage Act of 1873 was passed, the corruption of Congress, the banding together of the "creditor class," the machinations of the "money-power of the East" and of "Europe," the foreign gold plot to enslave America, and so forth. This has been going on so long now that it has reached the point at which the patient is unable to take a rational view of any subject, unaffected by the mania; has lost the sense of the distinction between truth and falsehood, and asserts as fact what is well known to all the world to be untrue. The *Gazette* makes out a strong case, but expresses the hope that the derangement is functional and not organic, and advises rest and a change of occupation.

The recent history of the Police Board in this city furnishes a curious commentary on the way in which our municipal affairs are managed. During the greater part of last summer the Tammany politicians, headed by John Kelly, made a furious assault on the Board, attempting to get into it one Purroy, an alderman, in place of Commissioner Erhardt, whose term had expired, but who was holding over. This was really a movement against General W. F. Smith, the President of the Board, who had disgusted the politicians by his manner of performing his duties. His offences were, 1st, that he was no politician, and consequently was opposed to using the police force as a political machine in the manner it had been used under Charlick and Matsell; 2d, that he tried to break up abuses, such as the practice of reinstating men, under pressure from "outside influence," who had been "broken" for misconduct; 3d, that he was a good disciplinarian, and by means of promotions for merit and removals for cause had brought the police to a pitch of effectiveness unknown before, which enabled the city in the crisis of the railroad riots last year to rely on it as veteran troops might have been relied on, and helped to save the State from the humiliating attitude in which other States were placed, of being obliged to confess their impotence to police their own borders unless helped by the army and

navy of the United States. Purroy's qualifications, on the other hand, were numerous. He was, 1st, a henchman of Kelly's; 2d, he knew all about removing, rotating, and reinstating; and, 3d, he knew nothing else. If he could be made one of the Board it would probably lead to General Smith's retirement and the control of the police machine by Kelly. Nevertheless the attempt failed; the Mayor would not nominate Purroy, and so General Smith stayed in.

The next move made was by the other side, or, at least, by the Mayor, against all the Police Board, with the exception of General Smith. On the 18th of last month the Mayor preferred charges against Commissioners Erhardt, Wheeler, and Nichols, founded on their failure to keep the streets clean, and on their irregular and capricious enforcement of laws, particularly the Excise laws. Before sending these charges to the Governor he was obliged by law to give the accused a hearing, and they immediately retained a score of lawyers, who picked the charges to pieces, showed that the streets were clean, that the Commissioners were not responsible if they were dirty, and that the blame for their dirty condition lay elsewhere; that the laws were not irregularly and capriciously enforced, and that their irregular and capricious enforcement was not the fault of the police. A great many curious things came out at the hearing; among others, that Mayor Ely is in the habit of writing letters of recommendation to office, privately intimating to the persons to whom they are addressed, however, that he means nothing by them. At first the Mayor appeared to be as bold as a lion, treated the arguments of counsel rather cavalierly, and created a general impression that he had made up his mind to remove. The *Tribune*, indeed, went further than this, and assured its readers that the charges were part of the "Tilden campaign of 1880"; that the Mayor had assured himself in advance of the Governor's approval of his charges, and that the vacancies were to be filled with "Swallow-tail" Democrats, whose confirmation by the Board of Aldermen was not to be necessary because the Corporation Counsel had discovered that the law in such cases gave the power of appointment to the Mayor alone. Unfortunately for the Tilden campaign of 1880, however, the Mayor has now announced his determination not to send the charges to the Governor at all, because he says that the Commissioners, while "in a measure derelict," are not so "to an extent which would justify their removal." The only official who has come out of the Excise row with credit appears to be Mr. Owen Murphy, pathetically called by the newspapers the "fugitive Excise Commissioner," who is now enjoying himself with his "swag" safe and sound in Toronto.

In Wall Street the week was notable for two Stock Exchange failures, one that of Netter & Co. and the other that of John Bonner & Co., and the Bankers and Brokers' Association, of which Mr. Bonner was president. The first failure was on liabilities approaching $400,000, and the last on liabilities of not less than $500,000. The bad feature of both was not, however, the amount of money involved, but the disclosure of the fact that the liabilities had been incurred and the losses made with money derived from the hypothecation of other people's securities, which had come into the possession of these firms as collateral security for money lent by them. The method pursued was this: The firms, representing that they had large amounts of money to lend, demanded choice securities as collateral; they then took these securities and borrowed a larger amount of money on them, and realized for their own uses the difference between the two loans. Had this difference been employed in lucky ventures the operation might have passed for sharp financiering if ever discovered, or it might never have been discovered. In these two cases the ventures were unlucky; the money was lost, and now exists, so far as these firms are concerned, only in the form of liabilities. These disclosures gave a great shock to confidence in Wall Street transactions; as, however, they caught several of the large speculators with a "bull campaign" on their hands, the developments were not permitted to interrupt more than temporarily the upward speculation in stocks.

The carrying off of the military bridge at Braila by drifting ice was followed by the destruction of the bridges at Nicopolis and Petroshani, and the removal of those connecting Sistova with Simnitza. All communication between the Russo-Rumanian armies in Bulgaria, both east and west of the Turkish quadrilateral, and their base of supplies in Rumania is thus broken off for a time, which must give an entirely new turn to the operations, or completely suspend them, unless new and speedy changes in the weather render the restoration of a bridge or two possible, or cause the Danube to freeze. The occurrence of the interruption was months ago predicted as probable, and yet it seems to have taken the Russian commanders by surprise, since reports from various quarters represent the camps of the invading armies as inadequately supplied with food for men and beasts, fuel, and other necessaries, even before the interruption of communication has made itself felt. Numbers of Turkish prisoners were left to die of cold at Plevna, it being "impossible," as a Russian official despatch stated it, "to afford them any aid"; scores of prisoners transported to Bucharest, exhausted by want of provisions, were left by their guards to freeze to death on the roadsides, as there were no vehicles to carry them, "though the absence of wagons was not due to deliberate cruelty." On the line of the Lom the Moslem inhabitants retire to the woods after burning their villages, the Turkish troops having withdrawn from their advanced positions; and, deprived of his supports, General Todleben, now the virtual commander of the Tzesarevitch's army, will hardly be in a condition to push operations against either Rustchuk or Rasgrad in the middle of winter.

The renewal of hostilities by the Servians and their successful advance in the direction of Sophia must thus be considered no less advantageous to the Russians than was the co-operation of the Rumanians in the Plevna campaign. The southern army of Servia, after the capture of Ak Palanka, occupied Leskovatz, south of Nissa, and Kurshumlie, west of the latter town; soon after reduced Pirot, on the road to Sophia, taking a number of guns and a few prisoners, and began the investment of Nissa. Turkish troops sent to reinforce Pirot arrived too late, and the garrison of Nissa will probably have to give up all hope of relief from without, since the advance of a Russian force which threatens Sophia must compel the withdrawal of the scattered Ottoman detachments now in Turkish Servia towards that city, or beyond it, if it is to be abandoned. The vanguard of the Russians operating against Ahmed Eyub Pasha has succeeded in occupying some Balkan defiles near Sophia, surprising the Turks by a march over snow-covered mountains and frozen foot-paths, and opening the road to the city. The Turks are expected to evacuate it, and to concentrate for the defense of the passes near Ikhtiman, leading from southwestern Bulgaria into Rumelia. The entrance of the Servians into Bosnia is reported from Belgrade to have been precluded by an effective protest of Austria; but it is only a strenuous resistance of Nissa which may prevent them from invading the region of Prishtina. The Montenegrins have achieved a success between the river Boyana and the town of Dulcigno, and recommenced the bombardment of Antivari. On the Black Sea, too, the Turks have suffered a loss in the capture of a transport steamer, with seven hundred men on board, by a Russian cruiser from Sebastopol. The operations against Erzerum have again been suspended on account of heavy snow. Mukhtar Pasha has left that city, surrendering the command to Ismail Pasha, apparently in order to place himself at the head of a small force in the field, which is to defend Baiburt and operate on the flank of the Russians. The Porte has asked for peace through the mediation of England; but Russia seems to be inclined to treat only with Turkey directly, and, before answering England's overtures, calls out fresh reserves, orders cannon, and buys rifles, while Russian organs resent the uncalled-for mediatory offers of the British Government by expressions of defiance. Somewhat oracular utterances of the French and Austrian Cabinets are reported, and there is a great deal of "sounding" done all around, and much telegraphing about an armistice.

A POLITICAL RETROSPECT.

WE have felt ever since the close of the Presidential canvass in 1876 that the year which has just ended would prove more instructive, in all that relates to the practical working of party government under our present Constitution and political usages, than any that had gone before it. The slavery controversy had come upon the country before party management had been reduced to the art it now is, and before the civil service had begun to be its leading instrument, and as long as it lasted the passions it bred were too fierce to allow the machinery of party to work normally and without considerable occasional derangement. Everything in politics during the war, and for ten years after the war, was, to a certain extent, exceptional. It was not until the close of General Grant's second term that war memories had sufficiently subsided to allow the machinery to operate, as one might say, *in vacuo*, without disturbance from external causes, and to drive both parties back on what may be called regular government—that is, the work of carrying society along the ordinary and well-traced line of progress. This at once subjected the whole body of party usages to some very curious and interesting tests, and submitted to actual experiment the question whether it was possible under the existing system for a party to reform itself without giving up its hold on power; or, in other words, whether what has been called "reform within the party"—that is, the extirpation of abuses created or fostered by a party—can be procured from the party itself, acting through its ordinary machinery and recognized leaders. The Cincinnati Convention and its proceedings, and the election and administration of Mr. Hayes, are all parts of this experiment, and they are for this reason very interesting, even as a mere study in politics, and without reference to their practical results. We believe there had been no case on record of a party, as such, mending its ways without going into opposition, and while in opposition to a certain extent reorganizing itself and changing its leaders, and in some degree its aims. There were, however, a large number of very thoughtful men among us whose imagination was sufficiently touched by the magnitude and splendor of the results which the Republican party had brought about, to believe it capable of the still more difficult feat of self-regeneration while in office. To their hopefulness Mr. Hayes largely owed his nomination, and the Cincinnati platform the unprecedented clearness and precision with which it described some of the abuses of which the party itself had been guilty, and the means by which they should be reformed.

When the canvass opened, the experiment entered on its next stage, and what then happened was as curious as anything which takes place in a chemist's laboratory, because it seemed to demonstrate the accuracy of long-settled belief, that as a party for all purposes of action may be said to consist of its leaders, a proposal that it shall reform itself is a proposal that the leaders shall make a general confession of error or incompetency in support of an application for a renewed lease of power. Accordingly, we found—and readers of the *Nation* will bear witness that we pointed this out steadily week after week, often amidst much obloquy at the hands of simple-minded people who thought that anybody who "supported Hayes" must surely be the friend of righteousness—that from the very first week the leaders absolutely refused either to preach the platform or preach Hayes as the reformers understood him and as he himself presented himself to the public. They avoided all mention of the reforms promised in the platform, and sought, both through the stump and the press, to persuade everybody that his Administration would closely resemble that of General Grant's—*i.e.*, would be devoted to the maintenance of a hostile attitude towards the Southern whites in the guise of efforts to protect the negro, and to the equitable distribution of the Government patronage among the Senators and Representatives of the party in power. There was no positive or open denial that reforms would be carried out. Anybody who thought they would was allowed to think so, but they were ignored in speeches and articles. No mention of them was made, and not only was no official encouragement given to anybody who talked about them and insisted on preparation for them in the canvass itself, but every effort was made by emphasis and exaggeration to fix public attention on matters very remote from them and to exalt Hayes's extreme reticence into the rank of a political virtue of the first order, and to insist upon it that confidence in him was a duty which somehow flowed logically from want of confidence in Tilden.

The results of this were twofold. In the first place, the weight of Mr. Hayes's responsibility, supposing him to be sincere in his promises to the reformers, was greatly increased—increased, indeed, to a degree which his previous career in no way warranted. His history in public life was that of a steady, faithful, good-tempered, modest man, while the rôle that the canvass thrust upon him was that of an imperious, self-confident, determined man, with very defined and deeply-rooted views on all the great points of public policy, who would be capable of carrying out reforms with his own right hand, in the teeth of any opposition, and within the period of four years. In the next place, it prevented the formation of a strong and combative public opinion to support him. There was in June, 1876, no such zeal for reform in the public mind, no such comprehension of its nature and necessity, as to relieve its friends from the necessity of preaching and expounding it vigorously through the canvass. As a matter of fact, it was, as we have said, not preached or expounded. The currency question, in spite of the threatening aspect it had assumed among Republicans in Pennsylvania and Ohio in the previous year, and among the Democrats everywhere, was hardly touched on by Republican orators and newspapers. The same thing may be said of civil-service reform. Not only was this latter subject not mentioned, but the abuses of the civil service were almost ostentatiously exhibited as among the means of Republican victory. Therefore, all the talking of the canvass redounded to the benefit of the old leaders just as they stood, and to the glorification or palliation of party management just as they practised it. So that when Mr. Hayes took office he really was what military writers call "in the air." He had behind him none of the instructed, drilled, and, if you will, inflamed opinion which Presidents usually count on when put in possession of power. His Southern policy, therefore—that is, his acceptance, with regard to South Carolina and Louisiana, of the overwhelming necessity to which his predecessor had bowed in the other Southern States—took people by surprise, which was intensified by his attempts to change the appointing system. Nobody was prepared for these things, neither Congress nor the party; so that his efforts to execute the party platform actually wore to large numbers of Republicans an appearance of treachery, and the curious spectacle, described recently in an interesting letter from Mr. Nordhoff to the *Herald*, is witnessed of his reading the platform to Republican members of Congress who go to the White House to remonstrate with him for *not* perpetrating the very abuses which that document specifically pledges the party to abandon. At this moment, indeed, it may be said that the leaders of the party—that is, the party organization, properly so-called—are banded together against him, and against everything that goes by the name of reform, thus showing that the programme put forward in 1876 was not really meant to be carried out, or meant to serve any purpose except that of a cheap and harmless concession to a small body of active and troublesome malcontents. Reformers, therefore, now find themselves in January, 1878, compelled to begin the work of exposition and propagandism which ought to have been undertaken in June, 1876, and this not simply for the benefit of Republican voters, but to a certain extent for that of Mr. Hayes himself. He undoubtedly suffered in common with the party at large from the want of proper discussion in 1876, and from over-reliance on Tilden's defects, and those of Tilden's supporters, for no one can fail to see that the last year has been passed by him in feeling his way to clear and definite conclusions. His worst shortcomings and mistakes, too, have undoubtedly been those of a general who has been suddenly placed in charge of a position which he had not examined, and about which no definite instructions had been given him except that he was to defend it stoutly.

The experience of the year will, however, have been cheaply bought if both Mr. Hayes and the reformers lay it to heart during the three years of his term which remain. Things cannot continue as they are. Republicans must choose between Mr. Hayes, such as he is, and his opponents in the party, such as they are, and the party must propose something in the nature of a programme. What the present party leaders, the Conklings, Butlers, Blaines, Chandlers, and Edmundses, propose we confess we do not know—although we have read carefully all they have recently said or written—beyond keeping the offices for Republicans, and allowing the Senators and Representatives of the party to distribute them. If anybody will examine what they say about the South he will find that it consists wholly of somewhat vituperative reminiscence, and contains no trace of a policy whatever. They reproach Hayes for what he has done, but they do not propose that he should undo it—that, for instance, he should now go down with troops and seat Packard and Chamberlain; nor do they point out in what way Hayes could have kept Chamberlain and Packard seated, supposing their opponents to have continued their resistance until Congress met, as they assuredly would have done. So that the Republican opposition to Hayes on this score appears to be absolutely objectless, to have no aim or end in view whatever, and therefore to consist of mere scolding. Nor does their professed regard for the negro take any practical turn. Even if Hayes had followed their programme in South Carolina and Louisiana, this would have done nothing for the negroes of Georgia, Alabama, Mississippi, Arkansas, North Carolina, Tennessee, and Virginia, in all of which they are virtually excluded from politics, so that as to the rights of the great bulk of the negro population they have nothing to suggest. Finally, we would ask all good Republicans, the sober, honest, intelligent men who founded the party and have kept it alive, whether they really believe that they can face another Presidential election with the smallest prospect of success under the guidance of men in whose political sincerity and integrity there is so little confidence as in Blaine, Conkling, Chandler, and the like? There never was a party yet which could hope for so little under the lead of charlatans and tricksters as the Republican party, and if it cannot provide itself with leadership which will have some hold on the conscience of the country before 1880, it will assuredly go into opposition for long years. All this, of course, amounts to saying that any hope of salvation through "harmony" at present is ridiculous. "Harmony," on the contrary, would be fatal.

THE LATEST FRENCH GAIN.

THERE is strong reason for believing that among the various means used to confuse Marshal MacMahon's mind by the authors of the "16 Mai" were arguments in favor of his absolute right to choose and dismiss his ministers drawn from the example of the King of Prussia and of the President of the United States. Recently there has been a vigorous effort made by the Prussian Parliament not, indeed, to influence the selection of members of the Cabinet—far from it—but to find out who the members of the Cabinet are. Herr Friedenthal was said to have been appointed Minister of Agriculture, and he himself said he had, but no official announcement of it was ever made to the Landtag. So also Herr Delbrück was said to have left the Cabinet and General Stosch to have joined it, but nothing positive could be learned about it. The curiosity of the Chamber was roused to the highest point, however, when it was officially announced to the Chamber that two foreigners, Herr Hoffmann, a Hessian, and Herr Bulow, a Mecklenburger, had been given seats in the Cabinet, but without portfolios. This led the head of the Catholic party, Herr Windthorst, and the head of the Progressives, Herr Virchow, to question the Vice-President of the Council, Herr Camphausen, on the subject. What they wanted to know was, how it happened that two foreigners were introduced into the Prussian Ministry; whether the King could increase the size of the Cabinet indefinitely by adding members without portfolios, to all of which Herr Camphausen replied that he ought to have mentioned the matter to the Chamber before now; that the composition of the Prussian Ministry was a little singular; but that the country was passing through an exceptional situation; that the two new ministers were excellent men, whom the Chamber would like; but that, as regards the king's power to increase the size of the Cabinet, that was "prerogative," and must therefore not be on any account discussed—and here the matter ended. The effect of talks of this kind on the Marshal's mind can readily be imagined, for it is not a mind capable of going below the surface of phenomena and detecting real distinctions. Parliamentary government in Prussia has really grown out of the antecedent state of things, just as parliamentary government grew in England. Prussia as a political community may truly be said to be the creation of the king and the army. To say that the king found a considerable tract of barren, unoccupied country, and planted military colonies on it, and then used them to extend his dominions by force, and gave his subjects a parliament when he thought it might be safely done, would be a rough but not inaccurate description of the growth of the Prussian state, and would account sufficiently for the king's unwillingness as yet to surrender his Cabinet, and for that peculiar feature of the Prussian system which makes all taxes once imposed permanent, and only leaves the Landtag the power of voting fresh ones. But of course the Marshal would hardly see all this, and could not be expected to comprehend why he, an unsuccessful soldier brought suddenly to the surface in the midst of civil turmoil, should not be deemed as worthy of confidence as the Prussian royal family, who had for four generations literally been identified with the state. The American system he probably found it easier to comprehend, as here the members of the Cabinet have no seats in the Legislature, and the President himself is responsible and impeachable, while in France the Ministry is responsible, but the President not.

But what more than all else confused him and made his surrender to the parliamentarians most difficult was the feeling, from which even the most liberal Frenchmen are not entirely free, that there are forces at work within French society which constantly threaten it with disruption and anarchy, and render it impossible to trust it wholly to the protection of a constitutional government. In fact there have, until very recently, been but few Frenchmen who did not look on the chief magistrate, under whatever form of government, as a sort of protector of the constitution, who was to give it fair play and a good chance of succeeding, but who in the meantime was to be always ready to supplement it, if necessary, by the use of direct force, or by the "state of siege." This view of the functions of the Executive has been strengthened and perpetuated by the concentration of power in Paris—or, in other words, within reach of all the dangerous elements in the French population—and as long as this was the case, and one or two days' fighting was sufficient to transfer the Government to anybody who happened to be in possession of the Hôtel de Ville when the insurrection triumphed, the notion that "society" was in danger was not wholly chimerical, nor the desire to have somewhere a strong hand untrammelled by law ready to save it, wholly unreasonable.

That this danger has been largely removed by the insurrection of the Commune is for France a gain so great that the material damage seems a small price to pay for it. For the first time since the Revolution, the seizure of Paris in 1871 did not carry with it the Government of France. The Legislature and the officials and the army refused to be bound by what had happened in the capital, transferred themselves to another place, and began to operate against Paris as simply a city in revolt, and succeeded. This effectually broke a spell which had exerted for ninety years a most malignant influence on French politics, and showed that the Government did not need for its protection a general and an army actually ready to go down into the streets at any moment; that society could be saved in a leisurely way and under legislative superintendence, and from any base of operations. Successful revolt in Paris will probably never again decide the fate of the Government; it may contribute to it or hasten it, but there will

always be forces outside Paris to be settled with or overcome, and the same thing may be said of a successful *coup d'état*. It is not likely that the dispersal of a legislature, and the military occupation of its seat, will ever again transfer the machinery of state to the commander of the troops.

The Marshal's own surrender to the Republicans is likely, however, to prove more valuable as a precedent than anything which has gone before it. From 1789 to our day every direct collision between the Executive and the Legislature, or the Liberals, has ended in a resort to force on the one side or the other. Louis XVI. attacked the Legislature with troops and was attacked by it. Bonaparte dispersed it with troops. Charles X.'s dispute with it ended in a revolution. The refusal of Louis Philippe's Ministry to enlarge the franchise ended in another. Louis Napoleon's differences with the Assembly, and the popular hostility to his dynasty, ended in the same way, by a fight in the streets. The news that Marshal MacMahon had a difference with the Legislature, and that both sides were firm and determined, led people to look for a resort to force as naturally as they would in England or the United States look for a resort to compromise of some sort. The earlier stages of the conflict, too, differed in no respect from similar ones which had gone before it, except in the greater calm and moderation of speech of the Liberals. The Executive never behaved worse, or took so little pains to conceal its real aims and opinions. The logic of French politics, in fact, required that MacMahon should either disperse the Assembly, or that the mob should overthrow him in the streets, or that he should collect taxes without appropriations. His surrender, therefore, at the eleventh hour, after trying various expedients, and the quiet and peaceable entrance of the Republicans on the enjoyment of their triumph, may be said to be another important contribution to the cause of good government—perhaps the most important yet made, for it breaks a most blighting tradition. Hereafter the outbreak of a similar dispute will presage to the popular mind not civil war but a long and patient discussion, and the final victory of the majority; force will be the last and not the first thing thought of.

DAUDET'S 'NABAB.'

PARIS, December 14, 1877.

I CONFESS having a great dislike to what we call "Imperial novels"—novels the heroes and heroines of which belong to the Second Empire. Zola, who became famous by his 'Assommoir,' has written his 'Rougon, Macquart & Cie,' or the history of a family under the Empire, and now Alphonse Daudet, the author of 'Jack'—Daudet, whom many already call the French Dickens, has himself sacrificed to the political gods, and has published an "Imperial novel" called 'Le Nabab.' Every personage, almost, of this new novel was well known under the Empire. The "Nabob" himself was a M. Bravay, who had made a large fortune in Egypt by means which were so impure that, M. de Morny having undertaken to make a deputy of Bravay, the Corps Législatif invalidated his election three times, though universal suffrage had pronounced three times in succession in favor of this "official candidate." The "Nabob," after all, is not the real hero of M. Daudet's new story: it is the Duc de Mora—I ought to say, the Duc de Morny. Alphonse Daudet had many opportunities for the study of this Imperial duke. When he was very young, very poor, and writing his first novels, he was recommended to M. de Morny, who was then president of the Corps Législatif. M. de Morny gave him a place as "secrétaire-rédacteur" at the Corps Législatif. I must explain the word. The debates of the Corps Législatif were phonographically reported for the official papers; but the "secrétaires-rédacteurs" made a summary of the debates, which was distributed to the press. As the journals could not give their own account of the debates they were obliged to choose between the phonographic report, which was often too long, and the official summary. This was thought necessary in the interest of truth.

Daudet was the colleague of Ludovic Halévy, the famous author of the "Belle Hélène" and so many other pieces; and I have noticed that all the secretaries of the Corps Législatif (as many as ten) turned against the Empire and became its enemies. They were young men, and perforce became the witnesses of many things which were not likely to please a candid mind. Still, in the delineation of M. de Morny's character and life made by Daudet there is, in my opinion, too much admiration and involuntary respect left. I know that there is a school in France which has idealized Morny and which looks upon him as a type of elegant epicureanism. I could never forget the part which he took on the 2d of December. It was not his fault that he was a natural son of General de Flahault's, but it is a singular coincidence that a mystery enveloped his birth as well as the birth of Prince Napoleon and of Count Walewski. Alexander Dumas the Younger might explain better than myself how these men were fated to be brought together. The 2d of December was the plot of a few bastards and a few profligates—"ære alieno et vitiis onustos," as Tacitus says; or, as Corneille says in his "Cinna,"

> "Un tas d'hommes perdus de dettes et de crimes,
> Qui pressent de mes lois les ordres légitimes,
> Et qui, désespérant de les plus éviter,
> Si tout n'est renversé, ne sauraient subsister."

Such has always been, in all countries and in all times, the secret history of *coups d'état*. The saviours of society must generally save themselves first. Morny had spent his youth in the army, he had been admitted to the intimacy of the Duc d'Orléans, he had become a deputy; when Prince Napoleon was made President he allied himself to him. A few days before the *coup d'état*, he was, as usual, at the opera, and somebody spoke of the urgency of a "coup de balai" (the sweep of a broom). "Well!" said Morny, "if the broom comes in action I will take care to be on the side of the handle." He was on the side of the handle—he was almost the handle; he assumed the terrible responsibilities of the *coup d'état;* he trapped his old friends, his old protectors, and sent them to Mazas. He was well rewarded; he became one of the gods of the new Imperial Olympus. I saw him but once in his place in the Corps Législatif, with the great cordon of the Legion of Honor on his breast, pale, and presiding in a languid manner over debates which could not excite his interest, looking through his glass from time to time at the ladies who were in the galleries:

Daudet gives us the details of the life of the Duke:

"Notwithstanding the early hour, the drawing-room was full. You could see grave, anxious faces; prefects of the province with red lips and administrative whiskers, not quite so arrogant there as in their prefectures; magistrates with austere mien and sober gestures; deputies full of importance; the great financiers; rustic manufacturers; here and there the ambitious form of a *substitut* [the *substitut* is the lieutenant of the public prosecutor or *procureur*], or a prefectoral councillor in a solicitor's dress—black coat and white cravat; and all, whether standing or seated, grouped or solitary, would fain with silent gazing unlock that lofty door which was shut upon their destiny—the door through which they were to pass in an hour triumphant or defeated. Jenkins [Jenkins is the Duke's doctor] went rapidly through the crowd, and everybody followed with a look of envy this new-comer, whom the usher with the silver chain, cold and correct, seated before a table near the door, received with a faint smile, at once respectful and familiar.

"'Who is with him?' said the doctor, pointing to the Duke's chamber.

"With the lips only, and not without a slightly ironical twinkle of the eye, the usher murmured a name which, if they had heard it, would have incensed all these high personages who had been for an hour waiting till the audience of the costume-master of the opera should be ended.

"A noise of voices, a ray of light. . . . Jenkins had entered: *he* never waited.

"Standing up, with his back against the mantel, in a short blue fur jacket, the softness of which gave more expression to a proud and energetic head, the President of the Council ordered a *pierrette* costume, which the Duchess was to wear at his next ball, and gave his instructions with the same gravity with which he would have dictated the articles of a bill.

"'Plait the ruffle very fine, but do not plait the cuffs. . . . Good morning, Jenkins; I am yours in an instant.'"

Such was in truth the Duc de Morny; politics seemed to him the most frivolous part of his life, and frivolity the most serious. He had the soul of a gambler, and, not content with the ordinary emotions of the card-table, he launched into all sorts of gigantic speculations; he built railroads, he opened coal-mines, he was a sugar merchant, he lent money to Mexico, he was a partner of Jecker, he bought picture-galleries; he tried to astonish the Russians by his luxury when he was sent as ambassador-extraordinary to the coronation of the Czar.

The best chapter in Daudet's new novel is perhaps the account of the Duc de Morny's death. Morny died very rapidly from the same extraordinary malady which killed Madame ("Madame se meurt, Madame est morte")—a perforation of the intestines. Jenkins (everybody in Paris knows who Jenkins is) could not save him. Jenkins thought his patient's state was only owing to his restless and dissolute life; the post-mortem

examination showed that Jenkins had ignored the nature of the malady, if he had not been mistaken in its cause.

The Duke's intimate friend and factotum was an old beau, M. de Monpavon (read Montgazon). When death was near, Mora asked Monpavon to burn all his correspondence. The scene is well described: the visit of the Archbishop of Paris, the arrival of the Emperor, the terrible conversation of Mora and Monpavon after the last consultation of the doctors:

"Mora called Monpavon to his bedside. 'Oh! you know—no grimace. . . . Between us the truth . . . I am very low, am I not?' Monpavon paused significantly; then brutally, cynically, fearing that words would make him too tender: 'Done for [the French is much more energetic], my poor Auguste.' The Duke received this without wincing. 'Ah!' was all he said. He stroked his moustache mechanically, but his features remained unmoved. And his determination was at once taken."

Morny's death was a hard blow to the court of parasites, of elegant *viveurs* who lived on the crumbs of his prodigality; but I believe that Daudet is carried too far by his enthusiasm when he writes: "He was, this Mora, the most brilliant incarnation of the Empire. What you see in a building at a distance is not its solid or tottering base, its architectural mass; it is the fine gilt spire, with its open tracery, added for the gratification of the *coup d'œil*. What one saw of the Empire in France and in all Europe was Mora. Mora fallen, the monument was deprived of all its elegance, split by long crevasses." I confess that I cannot share in this sentiment. Mora always appeared to me a very vulgar adventurer, who played at politics as he would have played at poker. His horizon was not larger than the horizon of his club; he was satisfied with the admiration of a few idle loungers who met at the Jockey Club. He had no eloquence; the little speeches which he pronounced at the Corps Législatif were totally destitute of wit. He had taken for his model (for every ordinary man has a model) some broken-down *beaux* of the Restoration—men who lived for their stables, their English jockeys, their faded mistresses. He cared more for the camellia in his button-hole than for the symbol of the Legion of Honor which he was obliged to wear. His elegance was borrowed from his tailor, his *esprit* from a few literary parasites who hung about him, his courage from his indifference. His social success was the bitterest satire that could be made on society under the Second Empire.

Daudet himself felt that his Mora, his Monpavon, his horrible "Nabob," who throws himself with his millions on Paris, and is trying vainly to become one of the "happy few"—that this collection of knaves, brutes, swindlers, quacks, literary and political jugglers whom he depicts, the atoms which follow the train of his comets, would leave too painful an impression on the reader. There is a very humane vein in his talent, and he shows us here and there a charming oasis of simplicity and purity, of Dickens-like sympathy, if I might so express myself, in the chapter called "La famille Joyeuse." Poor M. Joyeuse is a clerk in a bank; he is a widower and lives with his young daughters; he plays the part of a mother to them; his children tie his cravat, brush his hat. M. Joyeuse is a man of imagination; on his way to the bank his brain is always at work; he is so poor that he lives in the clouds of his own mind. He shuts himself up every night with the four playful, laughing girls who live for him; he goes back to his nest, to that little drawing-room which has a piano, and where two lamps throw their green light. "La vraie famille est chez les humbles," says Daudet, and we must thank him for this phrase, unjust as it may be, since surely the domestic virtues are even more admirable in a poor household than in those houses where everything seems to conspire to keep the family together.

There are many happy and charming details in this 'Nabab'; but, on the whole, I consider it much inferior to 'Jack.' In 'Jack,' Daudet's humane character appears in full. Jack becomes a friend, you cannot help suffering with him; the tragedy of a life, sacrificed to empty brains or to a cruel selfishness, becomes at times almost sublime. In the 'Nabab' there is nothing of the kind; the hero, the Nabob, is simply repulsive; it is impossible to have any sympathy with this miserable idol when it is rudely thrown from its pedestal. Mora, the real centre of the novel, is, to my mind, a subject which a novelist has no right to touch. He belongs to history; he will be remembered as one of those courtiers to whom Tacitus has given an immortality of infamy. Napoleon III. was a fatalist like Mora; he also played with destiny as the low gambler plays with dice. But, after all, he was an Emperor; he carried for years a whole people with him; his armies won great victories, even if they were in the end forced to capitulate. He had plans, designs, thoughts; the Moras had nothing but appetites. The Napoleons were slaveholders; the Moras were but slave-drivers.

Correspondence.

PROTECTION AGAINST FEDERAL SPOLIATION.

To the Editor of The Nation:

Sir: In addition to the large amounts of railroad and other corporation loans made to the West by Eastern and foreign capitalists, the aggregate amount of smaller loans, made on the security of farms and village property to private borrowers, by individuals, trust companies, and others, has become very considerable. So implicit has been the trust of the lenders in the honesty of the Federal Government, its legislation and currency, that little effort has been made to secure themselves against any contingency except the solvency of the borrowers and the crude irregularities of State legislation. But it now behooves every one having or contemplating such loans to consider what means are requisite to protect themselves or their heirs from repayment in clipped coin, base metal, or some other worthless material, under the prompting and by the means of ignorant or dishonest Federal legislation.

With the present condition of the proposed silver and greenback swindles we are all familiar; and when we consider the apparent popularity of these schemes, and hear Congressmen with impecunious constituencies openly advocating a return to the income-tax, not because of its necessity or of its merits as a system, but solely on the ground that its incidence will fall only on a small territorial section of the country, thus imposing on it the sole burdens of a Government whose principal expenditures are made elsewhere, it is time to consider whether the populous and older sections of the country enjoy any means of protection against the vast legislative power which, by means of States without population, speculative Senators without constituencies, and other similar agencies, has been conferred upon the newer portions of the country. It would seem that ordinary precautions should prompt all institutions making such loans to stipulate for repayment either in U. S. gold coin of a coinage anterior to 1878, or in the coin of some foreign country—as, for instance, sovereigns. Such stipulations, while operating as a reasonable protection to the lender of good money, would tend to inform at least the responsible classes in the West and South that all schemes of repudiation and robbery of creditors by means of legislation, while they may, by abolishing credit, inflict great restrictions on the volume of business, and numerous other great and permanent injuries upon the country, can only operate once as a means of transferring one person's property to another. For all more remote purposes of that kind they are absolutely futile, since in the long run it will be found that the same industry and ability which have accumulated capital will suffice to take efficient care of it. Capital will go abroad, will remain at home, will go anywhere except where it is legislatively or habitually despoiled and maltreated.

Of the ultimate results to any district of country of excluding capital from its territory, its people must themselves be the judges. It is their own affair. As for the other scheme of defraying the expenses of the Federal Government by an income-tax, selected because by a malicious mode of graduation it can be made to fall mainly on limited portions of the country, the latter will take care of that when it comes. If the crude and juvenile financiers of the "pocket constituencies" are laboring under the impression that the hard-working, wage-saving population of the non-repudiating States can be made to bear the exclusive burden of their Indian-war swindles, mail-carrying robberies, railroad subsidies, levee embankments, river and harbor improvements, etc., etc., it may be just possible that they are making another of their little mistakes. Some portions of the country which bawl loudest of their "enterprise" possess little other capital than the land which has been given them by the older States, and the improvements made on it with money borrowed from more thrifty communities.

We, who do not depend on borrowed money or Government appropriations for our existence, can of course afford to smile at mere braggadocio and noise, since it does not hurt us for our friends to have a good opinion of themselves; but, as these quickly-succeeding schemes for our spoliation begin now to look serious, both as regards our credit abroad and our savings at home, it seems time to consider how far investments in distant States enjoy any stability of law or protection of Government, and whether it is safe to make any more.

W.

Philadelphia, Dec. 26, 1877.

ANCIENT AMERICAN POTTERY.

To the Editor of The Nation:

Sir: Under this heading Mr. Prime has, in his recent book on 'Pottery and Porcelain,' made a few statements which will mislead the general reader if attention is not called to them, and, as the reviewer of the work in the last number of the *Nation* passed this chapter without critical remark, it seems necessary to allude to them.

It will be noticed that Mr. Prime is impressed by the peculiar type of pottery which he says, in several places in the chapter, is from "Alaska"; and he also calls attention to the interesting character of the pottery on the Pacific coast from Peru "northward to Alaska." Now, if there is one fairly established fact in American archæology, it is that ancient pottery is *not found* on the Pacific coast north of Mexico. The old peoples of the Pacific coast were pre-eminently workers in stone, and substituted stone vessels and water-tight baskets for the terra-cotta vessels of the more southern and eastern nations. It is evident that Mr. Prime has been misled in some way, and has throughout his chapter attributed to Alaska that peculiar kind of pottery known to American students as the "Pueblo type." This beautiful ware is not only among the best, so far as delicate construction and, often, artistic design are concerned, which has been found in America north of Central America, but is the only kind in the region mentioned having the colors fixed by a glaze. The centre of development of this type is found in the vicinity of the Gila and Colorado rivers, and, though the oldest ruins yield the best specimens—as is generally the case in American art—the present Pueblo Indians of New Mexico have continued its manufacture in an inferior and slightly modified form; hence the name of "Pueblo pottery" given to the type.

It is worthy of remark that not only is there an absence of prehistoric pottery on the Pacific coast north of Mexico, but that the recent Indians of the same regions must be classed with the non-pottery-makers, the few rude specimens of cups and lamps made by the Innuits of the extreme northwest, as mentioned by Mr. Dall,* being exceptional, and probably of late origin. There is also reason to believe that the few articles of pottery noticed by the early Spaniards among the Indians of Lower California were brought over the Gulf, or were at least of exceptional manufacture.

Mr. Prime dwells on the "community" of the ceramic art of Peru, Central America, Mexico, and Missouri; but this is more than a study of a larger amount of material than probably was at his disposal would warrant. That there is a general resemblance between some of the forms of the Missouri pottery and that from the *coast* of Peru is true, but the important differences so far outnumber the slight resemblances that this Missouri type must be considered as distinct, unless it be regarded as the *early form* which, by a nation's migration, was afterwards developed in Peru; and of such a migration we have not yet the proof. We can likewise note the same general resemblances in the art as developed on the coast of Peru and about Lake Titicaca, and yet, though they have always been confused and mentioned under the general term of Peruvian, there are two distinct types; the Titicacan type being more easily compared, as a whole, with the early pottery of Cyprus than with that from Anco on the coast of Peru. There are evidently as many degrees of development of the prehistoric ceramic art in America as in the Old World, and also the same evidences of intrusion of one nation upon another here as there. The truth is that up to this time, notwithstanding the statement made by Jacquemart in the concluding paragraphs of his chapter on American pottery, the early ceramic art of America has not been considered worthy of study, owing to a generally received notion of its inferiority in an artistic sense; whereas it shows a development of art that is of the greatest importance, for if its origin and growth could be determined, many vexed ethnological questions would be settled.

Mr. Prime, while calling special attention to the high state attained at some period by the Peruvians, especially in the models of the human head, considers that there is as yet no evidence of the progression of the art in any locality. The comparatively large collections, from several localities, now in the Museum under my charge, will, when arranged in the building just completed, give the means of showing such a progression to a certain extent. Among other things I am confident it will show the development of some of the designs, and that the "Greek fret," for instance, had an independent origin in America, and was not developed from the combination of straight lines, but from the earlier and ruder "spiral ornaments," as in the Old World. This interesting form of ornamentation is shown in many combinations in the beautifully incised and colored pottery from the ancient shell-heaps and burial-places in Brazil—a remarkable type of pottery, which Mr. Prime has entirely overlooked, notwithstanding Prof. Hartt's several communications and illustrations. It is interesting to note here that the pottery found by Prof. Morse in the shell-heaps of Japan, the oldest pottery yet known from that country, is, judging from the photographs of the Japanese, more closely allied to this incised pottery from Brazil than to any other with which I am acquainted.

The pottery of the Atlantic coast is considered by Mr. Prime as having "little of artistic interest. They are of the simplest forms, and such as savages often produce." Yet it is to savages that we must look for the early stages, the beginnings of all ceramic art, and when one studies the several forms of this early type, with the first attempts at ornamentation—the finger-marks, basket-work, cord-marks, punches, cut lines, and the use of hand-stamps of various designs—the pottery from New England and the Southern Atlantic States offers many valuable suggestions.

Mr. Prime, judging from his preface and introduction, is evidently not prepared to allow a very great antiquity to the American nations, and probably will hardly accept the evidence now being offered of man in the glacial period of North America; nevertheless his argument in favor of the Peruvian pottery being only a few hundred years old should be accepted with caution. With a climate as nearly favorable as that of Egypt for the preservation of works of art, and with burial customs in several respects similar, we certainly are not authorized to assume that articles are of recent origin because they are found in comparatively good condition; and it must also be remembered that what has been called the Inca period in Peru was probably inferior in the development of art, at least about Lake Titicaca, to that which preceded.

* 'Tribes of the Extreme Northwest. 1877. Powell's Survey' (p. 80).

Notes.

W. J. WIDDLETON will reprint in this country Sir Thomas Erskine May's 'Democracy in Europe.'——Jansen, McClurg & Co., Chicago, have in press 'Choice Readings, for Public and Private Entertainment,' by Prof. Robert McLain Cumnock, of the Northwestern University.——The committee of the Massachusetts Historical Society engaged in editing for the press the journals and letter-books of Chief-Justice Sewall desire to recover, if possible, the missing parts of the MSS., covering the period between April, 1677, and February 11, 1684-5. The last owner, who was unable to account for them, was the late Rev. Samuel Sewall, of Burlington, Mass.——The *New-Englander* begins its new bimonthly series with the current number. The most salient paper is a review of Joseph Cook's 'Biology' by a practised hand, name not given, but who is admitted to be an "eminent naturalist of orthodox opinions in religion." It bears some marks of haste, however, and the printer has not done it full justice. Prof. Carter, of Yale, reviews Principal Shairp's 'Poetic Interpretation of Nature,' and finds it vague and disappointing. Dr. Leonard Bacon approves President Hayes's course as regards the South, the civil service, and the currency. The religious tone of the periodical is well sustained in other articles.——The first number of *Sunday Afternoon* adds a tasteful, well-printed monthly to the list of our periodicals. The chief lesson of its table of contents is that the reading of fiction on Sunday is a good thing. Doctrinal controversy and the reconciliation of science with religion will be no concern of the editor's, he says in his salutatory, but questions of morality and of practical philanthropy will be allowed a large space. They figure to some extent in this January issue, of which the contributors are writers well-known for their scholarship or literary talents, and also for their liberal orthodoxy.——Berthold Auerbach will contribute to the *Deutsche Revue* in the second quarter of its second volume a new novel entitled "The Hostile Sisters" (*Die Feindlichen Schwestern*).——An International Geological Congress will meet in Paris on August 19, 1878, and will remain in session about two weeks. A geological exhibition in connection with it has been projected, contrary to the expectation of American geologists, who proposed that the geological department of the Universal Exposition be made as complete as possible.——The *Portfolio* for December, somewhat delayed by a press accident, has now arrived, and contains a good etching of Rajon's, after Chalmers, of a Frère-like group entitled "Prayer"; also Gainsborough's portrait of the "Beautiful Duchess," who kissed the butcher. For the

present year we have two interesting announcements: one by the editor, that his valuable articles on Turner will run through the volume and be completed before 1879; another from the American publisher, Mr. J. W. Bouton, that he has reduced the subscription-price to $10.

—The impulse which Harvard College Library is to receive from its new librarian is already manifest in its lately-published Bulletin (No. 6), which is a great improvement on the preceding numbers. They were merely bare and uninteresting lists of titles, bristling with abbreviations and otherwise typographically offensive. This number has not avoided all the defects of its predecessors, but it is better than they were, and, moreover, it does much that they did not attempt. It gives a list of the officers of the college library and of the departmental libraries; the rules; a statement of the library funds (from which we are glad to learn that the library has $15,000 to spend in books next year); notes on authorities in American history by Henry Cabot Lodge, running parallel to the syllabus of his lectures; and some miscellaneous notes, chiefly on recent publications. The latter suggest a comparison with Mr. Cutter's new annotated Bulletin which we noticed last September. The difference between the two is that the College Library notes, furnished and signed by the professors, will be an addition to the world's stock of criticism, and probably will deal chiefly with works of solid character, whereas the Athenæum notes are intended to be rather an anthology of contemporary criticism, so far as it can be represented in short extracts, and will to a much larger extent be in the department of belles-lettres. Both will have a certain permanent value; but the Harvard College notes, made by persons specially qualified to deal with the various subjects, will be of particular value in every college library in the country, among which the Library of Harvard College will no doubt soon take the same position that the Boston Public Library, under Mr. Winsor, took among city and town libraries.

—One runs over the list of contributors to the January magazines with some curiosity, partly because at the opening of the new year he expects each magazine to put its best foot forward, and partly to see what veterans still walk the stage, and who are the favorites among the new littérateurs. Here, among the poets, are Longfellow, Whittier, Holmes, and Cranch, of the older generation; Dr. Holland and J. T. Trowbridge of a later; and Stedman, Lanier, Paul Hayne, Fawcett, Boyesen, "H. H.," Celia Thaxter, and Emma Lazarus of the latest. Mr. Howells and Mr. Stoddard happen to have betaken themselves for the nonce to prose instead of verse. Among the novelists occur the familiar names of "Saxe-Holm," Edward Eggleston, and De Forest; while "Mark Twain," Charles Dudley Warner, Henry James, jr., and Edward King write humorously or sentimentally or realistically of their travels, and find at least a peer in a new-comer, Mrs. Jessie Fremont. Mr. R. G. White, writing on "Americanisms," and Mr. John Burroughs, on "Birds and Birds," are familiar objects to the critic of the magazines. Mr. Burroughs, by the way, mentioning several of our songsters in comparison with the nightingale and other British birds, omits to praise the notes of our wood-thrush, which Whittier describes perhaps as well as language can describe them in his poem in the *Atlantic*, in the single line—

"The wood-thrush rang his silver bell."

—The place of honor in the *Atlantic* is assigned not to any of the great names we have enumerated, but to the anonymous "South Carolinian" who has before this found the magazine a medium for communicating wholesome if unwelcome truths in regard to the Palmetto State. His present theme is "The Result in South Carolina"—meaning what has happened there since the President's "policy" took effect. He sums this up in his opening sentence, by saying that the State government is conducted at less cost with greater purity and efficiency; that crime and disorder have decreased and material prosperity increased; that there has been "a striking renewal of public, social, and military spirit among the whites," who have recovered at once their old political intolerance and their interest in Federal affairs; that the Republican party is extinct, and the negro banished from politics, to his great material advantage. And he concludes his paper by professing himself still uncertain whether "the result" is something to be lamented or the reverse. Most readers, we trust, will find no difficulty in taking the cheerful view of the situation, and we feel sure they would have been more apt to do so if "A South Carolinian" had given a little more attention to the chronology of the transition period which he endeavors to characterize, and had been a little more explicit as to the date, place, and circumstance of his more important incidents. His too indefinite and sweeping statements not only cause some confusion of mind, but might naturally excite distrust. His reasoning, however, strikes us as almost always sound, and that is what gives the chief value to his observations. We recommend his article to every one who wishes to see things as they are at the South, and especially to those who think that if "the result" had been a renewal of evil passions and race prejudices, "the policy" would have stood condemned. We recommend it still further to those who make the extinction of the Republican party the crucial test of the legality as well as the expediency of President Hayes's withdrawal of the troops. They will find ample food for reflection in this short passage, illustrating the new order of things: "You can see advertisements before the shops of negroes, like this: 'Patronize So-and-so, the only colored Democratic barber [or shoemaker] in town.'" Is not this shrewd fellow's Democracy as good an article as (say) Patterson's Republicanism? Has the negro lost anything but a name in losing "the party"?

—In the *Galaxy* a still more dispassionate observer, an Englishman, treats of "Negro Labor in Virginia"—"south-side Virginia," as he at once explains; for in truth there is the greatest difference in the general appearance and the agricultural prospects of the northern and the southern parts of the State. Mr. Siddons analyzes the character of the freedman without harshness but with entire frankness; acquits him of the graver crimes, but shows how his incorrigible petty larceny makes light crops, or, extended to rail fences, makes cattle-raising impossible; how his careless use of fire burns up fences and forests, and whatever buildings occur in the line of devastation; and what a thriftless, unintelligent, unprogressive cultivator he is. Add to this his incapacity for properly bringing up his own children, so that "we find that prudent business men, in employing labor, eschew young freedmen and seek the middle-aged." On the other hand, Mr. Siddons finds the whites—even those who do not share the unthrift and indolence of the blacks—at fault in not giving close personal superintendence to their laborers. Nevertheless, in spite of deteriorating soil, ruined enclosures, decayed dwellings, and all the other drawbacks enumerated, he thinks the farmers of this tobacco section are gradually bettering their condition, and laying up something in bank, while "one thing seems plain: hard necessity is here training up, out of the dashing, chivalrous slaveholders, one of the toughest, most enduring, and hardest types of the English-speaking races." Besides this article, we shall also bespeak attention for that on "The Defeat of Justice," by Theodore Bacon, which is an examination of the various forms of the pardoning power in the United States, and of the cause of its introduction into our constitutions, followed by a review of its abuses, and a suggestion of a substitute for it. The serious argument is enlivened by allusions to some serio-comic incidents in our recent history such as that "the mere fact of conviction of a crime presented to the [Federal] Chief Magistrate a *prima-facie* case for the issue of a pardon, without further enquiry"; and that a South Carolina judge was wont, in sentencing criminals under the rule of Governor Moses, to use this formula: "To the State's prison for five years, unless the Governor pardons you, as he probably will before you get there!" Mr. Bacon urges the erasure of the word "pardon" from all our systems, as a misnomer for what is but a remission of penalty; and proposes to make remission attainable only through a judicial proceeding; to empower all courts to reopen cases, on the ground of new evidence, at any time before the full execution of a sentence; and to make it competent for any person to testify in any case, no matter what his criminal record or penal condition; finally, if thus increasing the certainty of punishment should make existing penalties seem too heavy, to lighten them as may be proper. There are other articles in this final number of the *Galaxy* which both redeem it from moribund meagreness and induce regret that the magazine, after so long a struggle against adverse circumstances, has at last succumbed.

—The freshest thing in *Harper's* is the article on the Hot Springs of Arkansas, which is materially improved by the illustrations. The invalid, the mineralogist, the sportsman, and the lover of the picturesque have about equal inducements to visit this remarkable region, which has lately acquired some of the graces of civilized society without losing any of the charms of nature. The social aspects of life at the springs are least adequately treated by this writer, but they seem to promise a fair field for the humorist and not a bad one for the great American novelist. At least the romantic possibilities of the "corn hole" should not be inferior to those of Poker Flat or Sandy Bar. Mrs. Fremont's agreeable "Year of American Travel" is concluded in this number, the last part falling but little if any short of the two preceding in variety and interest. It tells chiefly of life at Monterey and San José, and of luxurious camping out en route between these places and San Francisco. But of more than

personal importance is the glimpse here afforded of the share which the Fremonts had in excluding slavery from the Constitution of California. The temptations for an eager, speculative population, with a scarcity of labor and a most laborious task of extracting mineral wealth from the soil, to encourage the introduction of slaves, are well set forth—temptations from which Colonel Fremont himself was by no means exempt. The homeward journey, after Fremont was made Senator, proved, like the outward, nearly fatal to his wife, but also showed her the good side of her countrymen :

"In every part of my journey I came upon proof upon proof of this manly kindness and care for women among our American men. To travel alone in Europe is impossible ; even travelling with one's children and a maid you do not receive the respect or attention that you have if there is a gentleman in the party. But in our country it is exactly different. The need of attention or assistance draws out that instinctive sense of protection which seems to be innate in our people. To be in mourning, or look ill or sad, or to be encumbered with children, is a sure appeal to the exercise of this instinct."

Apropos of Mr. Burlingame's recent paper on defunct magazines, Mr. Curtis describes in the Easy Chair, with knowledge and with a kindly sympathy, two of the bright lights of Knickerbocker literature—Charles Fenno Hoffman and the late Charles F. Briggs.

—The most striking feature of *Scribner's* is the amount of poetry contained in this single number—not less than nine pieces, of which five are massed together as if on some floral principle. But we cannot bestow much praise upon the collection. There is an article on the growth of cities in the United States which is suggestive rather than instructive, for the writer's handling of his statistics is not as dextrous as it should be. Mr. L. M. Dorman's "Century of Civil Service," on the contrary, pursues a good idea clearly and logically to the end, showing how our new republic started out under Washington with sound notions as to the purity and efficiency of the civil service, while England's was still corrupt, and how, in the past fifty years, the two countries have each reversed the theory and practice of the preceding fifty. Washington's views of his duty in appointments are expressed in his own words. The elder Adams's "nepotism," as we should now call it, in appointments ; Jefferson's rigid rule never to appoint a relative to office, while hankering to put an end to the "monopoly of offices in the hands of the minority," and to "assert some rights in the majority also"; Madison's amiable weakness in listening to the recommendations of low and designing men ; Monroe's respect for the *status quo ;* and John Quincy Adams's steadfast refusal to remove his political enemies on personal or party grounds, are all effectively passed in review. The enormous and sudden change for the worse, under Jackson and his immediate successors, is next described with the aid of some little-known authorities, and the duty of the country to return to the principles of Washington and J. Q. Adams, by availing itself of President Hayes's professions, is well enforced. We are glad that so fresh and readable a delivery on a trite subject is to have the benefit of *Scribner's* large circulation.

—Mr. Alfred T. Bacon's second paper in *Lippincott's*, describing his "Month in Sicily," is even more interesting than the first. Selinus and Agrigentum, and the enchanting coast between these ruins, are the subject of it. There is an unpretentious narrative, by General James S. Brisbin, of a trip through the Wind River country, which incidentally gives a good deal of information concerning the material resources of the valley, the Indians (Shoshones and Bannocks) who inhabit it, and the fortunes of the solitary white settlers. Two anecdotes are very characteristic of frontier life : one of a pioneer who had given his note for a ranche afterwards found to be on the Indian reservation, and who, having been condemned by a referee to pay his note all the same, said : "Well, gentlemen, that settles it ; but d—n me if I don't take in some other chap and sell him the ranche !"—which he afterwards did. The other is of two women, a widow and her niece, who lived alone, without fear of the Indians, having practised shooting with a view to emergencies of that sort. General Brisbin's admonition, that the Indians would certainly come and kill them some day, proved only too well founded. In the title of Mr. Paul R. Shipman's paper, "The Late Judge Nicholas of Kentucky," there is something like a challenge of the reader's knowledge. Not to have heard of Judge Nicholas perhaps argues one's self unknown ; not to be ashamed, after listening to his biographer, of having overlooked so great a man, might possibly imply that Mr. Shipman had magnified the subject of his admiration. In fact, however, he has made a very praiseworthy sketch of a man of character who was offered by President Johnson a seat on the Supreme Bench of the United States, but declined it in anticipation of not being confirmed by the Senate ; who resigned the Chancellorship of Kentucky because he would not form part of an elective judiciary, and who in other ways (though not in all ways) set a good example as a citizen and a jurist. Judge Nicholas's pedigree was well worth the space allotted to it, and the whole paper is a model of temperate eulogy and frank though friendly portraiture. Judge Nicholas was author of a modified scheme of electing the President which still merits consideration.

—A correspondent writes us :

"It seems but fair to point out that the extract from Canon Farrar's sermon given in the *Nation* for Dec. 27 seems to be taken from an incorrect report, and involves a misrepresentation against which the Canon has protested. In a recent letter to the London *Guardian* he says : 'Many complete misrepresentations of the language and purport of a sermon which I recently preached in Westminster Abbey have found their way to public notice. . . . To say, as these reports have done, that I 'denounced the doctrine of *eternal* punishment,' or expressed a hope that the word 'eternal' might not appear in the revised translation, is, as most of your readers will have seen at a glance, utter nonsense.' The subject of the Canon's sermon was an endeavor to show the possibility of an extension of *probation* after this life, a doctrine plainly distinct from the denial of eternal punishment, with which it has been, perhaps not unnaturally, confounded."

Mr. Beecher, too, is alleged to have suffered some misrepresentation—how much, any one can see for himself in the *Christian Union* for Dec. 26, which contains in full the sermon to which we alluded last week, and which we now, of course, read for the first time. It appears that what would "make an infidel of him," as he says, is not arguing that hell has existed since the year A.D. 33, but arguing that it was needed before that date ; or, to use his own words: "Tell me that back of Christ there is a God who for unnumbered centuries has gone on creating men and sweeping them like dead flies—nay, like living ones—into hell, is to ask me to worship a being as much worse than the conception of any mediæval devil as can be imagined."

—An exquisite manuscript of the "Romaunt of the Rose" will be on view at the auction-rooms of the Messrs. Leavitt until the 9th instant. We see so many more old illuminated vellums of a sacred character than of the purely literary type that this early love-song in its brilliant freshness has a vivid interest. The first illumination shows the poet mediævally nude in bed, or rather rising half-way out of bed, and surrounded by fair women, while half-a-dozen more of the same superior sex, decked with the most rigid and uncomfortable charms of the fourteenth century, look out upon society from the crenellations of a garden-wall in front. There are thirty-eight of these miniatures, very small, and of the rarest finish, the faces cut with cherry-stone minuteness on their backgrounds of blue and gold. The pictures are supposed to be by Charles IX.'s own illuminator, and there is a sonnet to the king on the first leaf, by Antoine de Baïf, poet of the Academy, which looks at first sight oddly modern in its lettering of ordinary Roman print. The owner, we learn, gave more than $1,900 for this specimen of the literary dissipation which Catherine arranged for the young king. The volume contains 154 leaves, which were formerly blackened a little at the edges in a fire, and are now cut down to the dimensions of 8 by 11 inches, but leave a sufficiently broad margin still. Another manuscript, a missal of the fifteenth century, with full-page paintings framed in uncommonly good floral borders, one of which was selected by Racinet for reproduction in his 'Ornement Polychrome,' will be found in the same collection, forming part of the library of a New York lawyer to be sold at Clinton Hall next week.

—The new (second) edition of Ottokar Lorenz's 'Deutschlands Geschichtsquellen im Mittelalter seit der Mitte des dreizehnten Jahrhunderts' is now complete in two volumes. The first volume, published last year, is devoted to South Germany ; the second, just published, is in two divisions —North Germany, and *Reichs- und Kaisergeschichte*. The work is mostly made up of notices of a multitude of obscure authors, whose importance is confined to the state or city of which they write ; for this their value cannot be exaggerated. The last division, however, being of a more general character, contains the account of many authors of wide reputation, like Marsilius of Padua, William of Occam, Cardinal D'Ailly, Chancellor Gerson, and Gregory of Heimburg. It contains, moreover, some compendious and exceedingly good remarks upon the great politico-theological controversies which called out the writings of these men. The last two chapters—upon the periods respectively of the controversy between Louis of Bavaria and Pope John XXII., and of the Schism—about fifty pages in all, present an admirable view of the course of thought and doctrine at these epochs. As an authority upon the history of this period, especially of the last half of the thirteenth century, this author probably has no rival.

NEW ENGLAND FEDERALISM.*

A COLLECTION of historical documents can rarely be called dramatic, but this term may be very fitly applied to the contents of the volume whose title we give below. In the political drama which is here unfolded the various personages tell severally their own stories in their own language, state their own opinions, and reveal their own characters, while the editor preserves as scrupulous an impersonality as the most finished playwright. These letters, public and private, revive in all its pristine vigor a controversy which has long slumbered, and the actors in these nearly-forgotten scenes move here before the eyes of posterity instinct with all the hopes, fears, and passions which find such powerful expression in their correspondence. The outlines of this controversy, which has now passed into the domain of history, can be briefly stated.

During the summer of 1827 the Hon. William B. Giles, then Governor of Virginia, was engaged in the congenial task of electioneering in behalf of General Jackson. In the words of John Quincy Adams, Mr. Giles had made it the occupation of his life "to compose and publish ribaldry and invective upon his superiors," and his employment in the summer of 1827 was an excellent illustration of the truth of this statement. The particular object which he then had in view was to convince the people of Virginia that the god of their idolatry, Mr. Jefferson, was not opposed to Jackson, but had a very low opinion of Jackson's rival, Mr. Adams. For this purpose Mr. Giles had written to Mr. Jefferson shortly before the latter's death to obtain, if possible, his assistance in holding up Mr. Adams to the public as a traitor to his friends in 1807, as well as in reprobating his general policy while President. In response Mr. Jefferson wrote two letters to Mr. Giles. The first one was intended for publication and as a vindication of Mr. Adams's course in 1807; the second was confidential, and discussed in a hostile spirit the principles laid down in Mr. Adams's first message. Mr. Giles, characteristically enough, suppressed the first letter and published the second. Thereupon some supporters of Mr. Adams in Virginia obtained from Col. Randolph a copy of the first letter to Giles, and gave it to the public. In this first letter Mr. Jefferson had intended to justify completely Mr. Adams's actions in 1807, but unwittingly and through great and obvious confusion of memory he exhibited Mr. Adams in the light of a deserter who had sought to make peace with his enemies by secret accusations against his former friends. Mr. Adams now felt an explanation on his part to be necessary, and an authorized statement appeared in the *National Intelligencer*, which showed that Mr. Adams in 1807 had only warned Mr. Jefferson that British intrigues to increase party dissension and to divide the Union were on foot in New England. The statement, however, went on to say that in 1808 Mr. Adams had written to Mr. Giles and others in Congress that a continuance of the embargo would lead in New England to resistance, civil war, the co-operation of Great Britain, the dissolution of the Union, and the establishment of a Northern confederation, which he knew from unequivocal evidence, although not provable in a court of law, to have been the objects of the Federal leaders for several years.

Into the controversy thus opened Mr. Giles, assisted by his excellent friend Senator John Randolph, plunged with delight, and fell to garbling facts and blackening his opponent's character with his wonted zeal. Meanwhile, Mr. Adams's sweeping charges, as perhaps the amiable Giles foresaw in the beginning, had aroused in another quarter old enmities which had slumbered undisturbed so long as to seem wholly extinguished. In the autumn of 1828 thirteen gentlemen of Boston, most of them prominent Federalists in the struggles of twenty years before, a few of them sons of the former leaders of the party, addressed a letter to Mr. Adams asking specifications and evidence of the charges recently made by his authority in the *National Intelligencer*. In reply Mr. Adams confessed to his belief in his accusations, reiterated them, and refused to answer further, taking advantage of technical objections which, however admirable in special pleading, seem now neither fair nor sufficient in a case of this kind. One explanation of this proceeding, so unlike Mr. Adams's usual behavior, may perhaps be found in the fact now made apparent, that he had at the moment no perfectly satisfactory or conclusive evidence to bring forward in support of his accusations.

On receiving Mr. Adams's answer, the Boston Federalists published an appeal to the people, the essence of which was contained in the following paragraph in reference to the plan of disunion alleged by Mr. Adams to have existed in 1803–4: "We solemnly disavow all knowledge of such a project, and all remembrance of the mention of it or of any plan analogous to it at that or any subsequent period." With Mr. Adams's refusal to give names or evidence and with this solemn denial the controversy closed, and the sequel has been reserved for posterity. Had this sequel never been given them, as Dr. Von Holst says, the judgment of history must have been suspended, the burden of proof must have rested with Mr. Adams and the victory at this stage with his opponents. When Mr. Adams left the Presidency, smarting under defeat and attacks of every kind, he at once prepared a long and elaborate reply to the appeal of the Boston Federalists, and he also obtained additional and conclusive evidence from Mr. Plumer, of New Hampshire, showing that separation was urged among the Federalist leaders in 1804. This reply, for good and sufficient reasons, was not published, and is now given to the world for the first time, and forms the larger part of the present volume. It is preceded by the correspondence which gave rise to the controversy, and is followed by a series of private letters relative to this subject, drawn chiefly from the Pickering MSS., and some of which have not before been printed. All the important documents are thus grouped together, and the judgment of history need no longer be suspended.

The net result seems to be this: Mr. Adams charged that a plot to dissolve the Union existed in 1804 among the leading New England Federalists; that this plot was never abandoned, but was revived in 1807 and in 1814; that this was the object of the Hartford Convention, and that the Federalists plotted treason with John Henry, the British negotiator, and longed for separation as a good thing in itself. Reviewing these accusations in the light of all the other evidence, the last two may be at once dismissed as wholly groundless, though reasonable enough to the imagination of a heated partisan. As to the others, there can be no manner of doubt from the papers in this volume that in 1804 there was among the Federalist leaders in Congress a plan to dissolve the Union, and that Timothy Pickering, James Hillhouse, Roger Griswold, and probably Uriah Tracy, were its principal supporters. It appears also that from various motives the leaders of the party in the different States, including Alexander Hamilton, Rufus King, George Cabot, and others, were opposed to the scheme, and that through their opposition and the subsequent death of Hamilton it came to nothing. Whether it was then abandoned is a mere question of terms. In 1807–8 secession was freely discussed in New England; it was advocated in the press and was echoed by the resolves of town-meetings, but the sentiment of some of the leaders, who perceived the party advantage given them by the embargo, appears to have been against it. At any rate, nothing definite was either planned or carried out.

As to the Hartford Convention, the great theme of Mr. Adams's 'Reply,' opinions must always differ. The impression produced by a perusal of these papers is that there were two elements among the Federalists in 1814. One comprised the younger, more violent, and more extreme men, who were only too ready for desperate measures. The other was composed of more moderate men, who, although they deemed it probable that there must in the end be a dissolution of the Union, were determined to delay to the last any decisive action, to curb party violence, and, if possible, to avoid secession. The latter element prevailed at Hartford. With the state of facts disclosed in these papers, it is difficult to reconcile the general denial just quoted from the "appeal" of the Boston Federalists. The signers of this appeal were all men of honor, integrity, and high position in the community, which makes still more insoluble the difference between their statement and the facts displayed in this volume. This contradiction is, however, susceptible of explanation in large measure. Some of the signers were too young to have been in the party councils from 1804 to 1814, and none of them, with the exception possibly of Mr. Otis, occupied such a position as would have admitted them to the carefully-kept secrets of 1804. As to the later period, they must all have known that secession was freely and publicly advocated, but there was no definite "plan" of action, either in 1807 or in 1814. On this word "plan," therefore, their denial must hinge, and, taken in this way, it strongly confirms the view that there was no settled scheme of disunion later than that of 1804.

There are many other interesting features in this collection of papers besides those of purely historical value. From a literary point of view, the main document, Mr. Adams's 'Reply,' is a remarkable composition. There is no noticeable richness in Mr. Adams's ordinary style, but when he launches out into invective the wealth of his vocabulary, the vigor of his sarcasm, the savage ferocity of his direct assaults, combine to make this paper an almost unequalled piece of political controversial writing, worthy to rank with the best efforts in this branch of literature. It re-

* 'Documents relating to New England Federalism, 1800–1815. Edited by Henry Adams.' Boston: Little, Brown & Co. 1877.

veals also, in a striking manner, some salient traits of the writer's character. His inability to judge character coolly and justly by casting off prejudice, his strong sense of right which led him to act correctly in essentials, and his want of tact which led to his failure in details, and to many of the bitter hostilities which always environed him, are all conspicuous here. Hardly less so is the strange habit of forming a clear, sharply-defined theory, and then forcing men and facts to fit it by an absolute rejection of the endless modifications of human character and motives. Another point is the writer's curious process of selection among his opponents. Mr. Adams believed Colonel Pickering to be the head and front of the Separatist movement, yet he scarcely mentions him, while upon Harrison Gray Otis he pours out the vials of his wrath with unstinting hand. Prof. Adams has omitted the most personal passage relating to Mr. Otis; but enough remains, and if the invective of Mr. Adams be read in connection with the sharp censures of Colonel Pickering and the Federalists, there is but little left of a hostile nature to be said against the unlucky "father of the convention." The wavering character of Mr. Otis found no mercy at the hands of the vigorous combatants among whom he was thrown. There is, too, a wholly different tone in Mr. Adams's treatment of his New England opponents from that displayed towards Giles and Randolph. The former has an almost fratricidal bitterness, but is not wanting in respect for his antagonists, while the latter suggests nothing but an abounding contempt for the utterly vile.

HEBREW MYTHOLOGY.—I.*

SINCE Max Müller claimed for the study of comparative religion the position of a new science, which was to unlock the sacred mysteries of the past, the subject, always fascinating to a certain class of minds, has acquired a wider and more popular interest than before. The development of the stores of Eastern learning has afforded materials hitherto unknown, and the various faiths of the great races of mankind can be followed into remote antiquity, their origins sought, and their evolution compared, with a fulness and accuracy not previously attainable. Yet with all this the "science" is not a new one, it has not as yet the remotest claim to the dignity of a science, nor do its modern votaries display any more of the true scientific spirit or use methods more scientific than their forerunners, who for more than two thousand years have amused themselves with identifying different faiths and seeking for the esoteric meanings supposed to be concealed in popular mythologies. Diodorus Siculus explained the myths of Greece by the operations of Nature with as shrewd a rationalism, and Plutarch with ingenuity as well directed, as Kuhn or Müller, or their follower, the Rev. Mr. Cox. Euhemerus and his school displayed as keen an insight in the use of their materials as those who now ridicule them; and Herodotus identified the polytheisms of Greece and Egypt, and Dionysius of Halicarnassus those of Greece and Rome, as confidently as any modern philologist. Since then, except during the Dark Ages, there never has been a lack of learned men ready to speculate on such subjects and to put forward their speculations as incontrovertible verities.

The difficulty in accepting their results lies in the tendency of every investigator to have his pet theory, to which all facts must be made to bend. Some general principle is assumed to be the master-key which will open all mysteries, and everything which will not yield to it is either quietly ignored or boldly distorted. The systematizer loses sight of the truth that popular religions are most complex things, originating from and reflecting all the shifting and conflicting moods of heart and soul, and that whatever once forms part of them is apt to be retained with a tenacity which defies all logic, however antagonistic or incompatible it may seem in relation to later elements. The ancestor-worship which prevailed in China from the pre-historic period of the Hia dynasty is still the sole recognized official religion, despite the intrusion of Taoism and Buddhism. The mingled nature and soul-worship of the Japanese aboriginal Shinto is now reviving, and is extruding the imported faiths that seemed to have annihilated it. The hero and ancestor-worships of Greece and Rome assumed but a slight disguise when they took the shape which fitted them into the hagiology of Christianity; and oddly enough they reappear where one would least expect them, in the calendar of the Comtists. Fetishism, which scientific mythologists assure us is the cult of the rudest and most primitive state of humanity, holds its own in spite of the most advanced civilization and the loftiest conceptions of the relations of man with the supernatural. It is perfectly at home amid the subtle speculations of Buddhism, and it degrades the sublime simplicity of Gospel teachings with transubstantiation, relics, scapulars, and winking Virgins. As we write, there lies before us a French Ultramontane journal of October 20 last, which triumphantly points out that the only arrondissement in Paris which returned a MacMahonite deputy in the recent election was that in which stands the church of Notre Dame de Salut, before whose thaumaturgic image the *neuvaine* of prayers for the success of the clerical candidates had been observed with special fervor.

Spontaneous religions are composed, in varying proportions, of fetishism, nature-worship, and soul-worship, and the various elements of these are frequently so intermingled and disguised that their accurate analysis becomes almost impossible. Yet those who investigate them, with scarcely an exception, attempt that analysis with a single reagent, and therefore can obtain no results worthy of consideration, except as material for fuller and broader investigations. It simplifies the problem, of course, to omit all the unknown quantities but one, but, whatever be the show of scientific processes employed, the resulting formula is utterly inadequate to the solution sought, and therefore utterly unscientific.

Each age has had its own system of interpretation according to its prevailing currents of thought. The early Christian fathers believed that all heathen gods were merely the imps of Satan, permitted for some inscrutable purpose to deceive humanity. Suidas informs us that the saga of the Golden Fleece related simply to a book on magic and alchemy written upon parchment. The earnest study of the Scriptures to which the Reformation and its controversies gave rise, led scholars to seek in the Biblical narratives the source of all other faiths, which were regarded as degenerate corruptions of the primitive revelation bestowed by God on man. Sometimes the desired results were obtained by means of the derivation of words; and in the existing ignorance of comparative philology, the simplest assonance between syllables of the most widely differing languages was held sufficient to justify the oddest identifications. Guillaume Postel, who, though crack-brained, was the most learned Orientalist of his day, was certain that the name of the Brahmans was derived from Abraham. Others held that Shem was the same as the obscure Latin deity, Semo Sancus; while Ham, who obtained Egypt, was indubitably the god worshipped in the Nile Valley as Ammon; Japhet was unquestionably the Titan Japetus, and Moses was Musæus. Similarity of incident was an equally fruitful source of identification. As Noah divided the world between Shem, Ham, and Japhet, even as Cronus partitioned the universe between Zeus, Poseidon, and Hades, so the actors were necessarily the same, and Zeus was no other than Ham, Poseidon than Japhet, and Hades than Shem. Noah's planting of the vine naturally identified him with Dionysus, and his survival of the Deluge with Deucalion; but it is not so easy to understand the reasoning which variously proved his identity with Osiris, Prometheus, Saturn, Janus, Uranus, the Oannes of Berosus, Foh the Chinese Buddha, and the Noh of the Hottentots; while his putative wife, Naamah, became Vesta, Rhea, Cybele, or Venus.

The history of this laborious trifling might be extended almost indefinitely from examples supplied to us by the foremost scholars of the sixteenth, seventeenth, and eighteenth centuries, but the fashion gradually passed away except among the most conservative, where it lingers even yet. The scepticism of the encyclopædists and their school soon found fresh material to work upon in the labors of the Anglo-Indians, led by Sir William Jones and Colebrooke, while the development of the antiquities of Egypt by the savants of Napoleon's expedition contributed much food for thought and speculation. Some enthusiasts discovered their universal solvent in phallism, or in tree and serpent-worship; but the tendency of the age was directed to the pursuit of the natural and physical sciences, and this was not long in manifesting its influence on the theories of mythologists. The modern school was practically founded by Dupuis, who, in his 'Origine de tous les cultes, ou religion universelle,' exhausted the learning accessible at his day in the effort to show the astronomical origin of all religions and religious symbols. Creuzer, on the other hand, in his 'Symbolik,' vainly poured forth his vast erudition in proving that all religion was originally a monotheism, from which the various polytheisms were derived. The tide set too strongly in the direction of naturalism to be resisted. The development of European science was taking more and more the form of close observation of nature, and nature consequently was more and more assumed to be the sole object of attention to the primeval savage; while the increasing study of the Vedas, the attention bestowed upon folk-lore, and the deciphering of the cuneiform inscriptions, gave new and important material out of which to construct new systems. The brilliant identification—due, we believe, to Max Müller—of Dyaus with

* 'Mythology among the Hebrews, and its Historical Development. By Ignaz Goldziher, Ph.D., member of the Hungarian Academy of Sciences. Translated from the German, with additions by the author, by Russell Martineau, M.A., of the British Museum.' 1 vol. 8vo, pp. xxxv.–457. London. 1877.

Zeus and Jovis, and of Varuna with Uranus, broke down all restraint. Comparative philology was proclaimed to be the long-sought-for key, and nature-myths to be the infallible solution of all the mysteries that had defied interpretation for thousands of years: and learned professors vied with each other in the reckless ingenuity with which they tortured all the mythologies and legends of the world into endless duplications of the loves and combats of night and day, sun and moon, dawn and twilight. Already there are signs of a healthy reaction. Coulanges' thoughtful little book, 'La Cité Antique,' is a well-directed effort to restore ancestor-worship to its true place as one of the prime factors in religious belief, though he too commits the error of rendering his theory too exclusive.

To this reaction the book under review ought to contribute its share, for it is a shining example how abundant learning and ingenuity, under the forms of scientific method, when unrestrained by sobriety of judgment, may lead the comparative mythologist to the most extravagant and absurd conclusions. Prof. Goldziher is a man of wide erudition, especially familiar with the Semitic languages and literature, and already known by his 'Studien über Tanchûm Jerûschalmi,' published in 1870. Unfortunately his discretion is not equal to his attainments and his ardor. Some fifteen years ago, Professor Steinthal tried his hand at the "scientific" resolution of some of the Hebrew myths, and by profound psychological and philological methods proved satisfactorily to himself that Samson was a beneficial sun-god and Delila either an evil moon-goddess or the winter-goddess, while Moses, moreover, was merely a Semitic adaptation of the Vedic Matarisvan and Hellenic Prometheus, for when "Moses struck water out of the rock with his staff, the staff is the lightning, the rock the cloud, the water the rain" (pp. 391, 428-9). Regretting that this promising field of speculation had remained uncultivated since these first efforts of Steinthal, Goldziher has taken up the subject, resolved that not a single character in Genesis should escape identification with the all-pervading nature-myth if ingenuity could effect its transformation. In this he succeeds to his satisfaction, though he apologizes because a few resist the reaction of all the solvents that he can apply. Some of the sons of Jacob are among these, and also Arphaxad, and he takes credit to himself when he "resists the temptation" of unveiling the secrets hidden under the names of Selah and Eber, "as it is not my business here to indulge in vain speculations" (p. 132).

COBDEN.*

"WE have no desire to be politicians. If I were not convinced that this question comprises a great moral principle, and involves the greatest moral revolution ever yet accomplished for mankind, I should not take the part I do in this agitation. Free-trade! What is it? Why, breaking down the barriers that separate nations—those barriers behind which nestle the feelings of pride, revenge, hatred, and jealousy which every now and then burst their bounds and deluge whole countries with blood—those feelings which nourish the poison of war and conquest, thinking that without conquest we can have no trade—which foster a love for conquest and dominion, and send forth your warrior chiefs to scatter devastation in other lands, and then to return, enthroned securely in your passions, to harass and oppress you at home. It is because I think that I have a full apprehension of the moral bearings of this question that I take pride and gratification in sharing the present agitation; and I invite you all to take part in it, for there is room and glory and fame enough for all of us in the achievement of the great triumph of corn-law repeal."

Thus spoke Cobden in 1843, and his words afford the best comment on his career which could be wished for, either by an admirer or by a critic. Moreover, they contain the true account of Cobden's claim to permanent fame or the gratitude of mankind. He was not a great economist; he did not originate any economical doctrine; and if he expounded the arguments in favor of free-trade with unrivalled lucidity, he could not, from the nature of the case, produce a single argument or a single illustration which had not been already put forward by men of far greater intellectual power than his warmest admirers can ascribe to Cobden. The theory of free-trade had been worked out before Cobden was born. The intellect of England had condemned the corn-laws before Cobden began his agitation. "As for the corn-laws, my opinion any time these ten years has," writes Thomas Carlyle, "been complete and even, so to speak, more than complete. For these ten years I have heard no argument or shadow of an argument in behalf of them which was not of a kind too literally to make the angels weep. I consider that if there is a pernicious, portentous, practical solecism threatening huge ruin under the sun at present, it is that of corn-laws in such an England as ours of the year 1843." On this matter the language of O'Connell was as decided and fully as vigorous as Carlyle's. Nor was it Cobden who enlisted democratic fervor on the side of the League. Mr. Ashworth's work suggests that on the whole the artisans, occupied as they were with the agitation for the Charter, did not heartily support a movement which was under the guidance of millowners and manufacturers. As far as the workingmen were won over to the cause of the League, they were conciliated rather by the democratic ring of Bright's eloquence than by the cogency of Cobden's arguments. Cobden's force did not lie in his eloquence or in his skill as a party leader. It lay, where he has placed it, in his "full apprehension of the moral bearings of the question." For good and bad alike he may be compared rather to a religious teacher than to a statesman. He preached the cause of free-trade in season and out of season. The whole movement bore in his own eyes a moral aspect. To abolish the corn-laws was to take the first step towards that universal freedom of commerce which in his mind was identified with the end of hostile rivalry amongst nations and the commencement of an era of universal peace and prosperity. For a time, at least, he impressed his own belief on the most vigorous part of the English nation. The cause of economic science for once received the aid of moral enthusiasm, and a struggle which might perhaps have lasted for years was brought to a rapid close, partly through the accident of favoring circumstances, but in great part also from the fact that Cobden had aroused the moral feeling of the people, and had led good men of all classes to identify protection with selfishness.

In some respects, no doubt, the leaders of the League were greatly favored by circumstances. That the monopoly attacked was a monopoly of the people's food gave a rhetorical force to denunciations of protection which is wanting when the protected interest deals in iron or linen. Peel's education and intellect must in many respects have predisposed him to conversion by Cobden. If Peel had not been a Conservative minister he would probably have been a leading member of the League. But, when every deduction is made, Cobden's triumph must in fairness be attributed to the goodness of his cause and the qualities of his character. At a time when, from causes which we may in some future article attempt to analyze, popular stupidity and the misplaced ingenuity of literary paradox-mongers have produced something like a reaction in England in favor of protection, it is a duty to speak the plain truth on what ought to be a plain matter. The man who said that protection always meant robbing somebody, only put a palpable truth into a telling form. Cobden, Bright, and their associates who pressed this truth in every shape in which it could be presented upon the attention of the English public, succeeded and deserved to succeed, because they had on their side the whole force of undeniable facts and incontrovertible arguments. Nor can Cobden's character be left out of account in estimating the causes of his success. There are some men whose words bear the unmistakable impress of sincerity and faith. That Cobden was one of these men we do not for a moment doubt. You might as well believe that Knox was insincere in his hatred of popery, that Wesley was a hypocrite aiming at making money rather than saving souls, or that Burke did not detest the revolutionary movement, as conceive that Cobden did not believe heart and soul in the great moral revolution to be effected by free-trade. The critics who wish to understand even the weak side of a man like Cobden must begin by admitting to the full the strength of his character, and must look for his defects not in opposition to, but in close connection with, his virtues.

The passage from his speeches already cited shows clearly enough what were some of the defects which will always detract from Cobden's fame, and prevent him from taking the highest rank among either statesmen or reformers. The astonishing assertion that the free-trade movement "involves the greatest moral revolution ever yet accomplished for mankind," might in the mouth of an ordinary speaker, or even of a great orator such as John Bright, pass for a rhetorical exaggeration. In the mouth of Cobden we believe that it is the simple expression of genuine belief. But the moment you give the words their full weight you are forced to astonishing conclusions as to the convictions of the leader by whom they are uttered. Grant (what is very possible) that Cobden considered the progress of Christianity to belong to an order of events which could not be described as a moral revolution, and did not therefore mean to compare the destruction of paganism with the repeal of the corn-laws, it still remains the fact that the moral revolutions worked by the Renaissance, the Reformation, the great French Revolution, and other movements which will suggest themselves to every reader, all seemed in the eyes of Richard Cobden to be of less importance than the movement by which English landlords were prevented from taxing foreign corn. That

* 'Cobden and the League. By Henry Ashworth.' London and New York: Cassell, Petter & Galpin. 1877.

he honestly thought this we do not doubt, any more than that he honestly believed that there was more to be learnt from a copy of the *Times* newspaper than from "all the works of Thucydides." But to think in this way is not to reflect like a man of thought or to calculate like a statesman, but to be carried away with the enthusiasm of a moral or religious zealot.

Cobden, however (it will be urged and with truth), looked to wide moral results which, if effected, would produce not indeed the greatest of moral revolutions, but still a revolution of considerable magnitude. This we fully admit; but admission leads up to the weak point in Cobden's career and character. He believed ardently in his creed, but the creed itself was neither wholly true nor wholly noble. At the bottom of it lay, in his mind, a dogma which he expressed with characteristic clearness. "It is certain," he said, "that in this world the virtues and the forces go together, and that the vices and the weaknesses are inseparable." This doctrine is, to say the least, an exaggerated statement of a partial truth. It may be to some men, and those the noblest of their species, the expression of the profoundest faith in the triumph of virtue. But to most persons of energetic character the belief that might is right suggests an undue veneration for force of some kind or other. The force which Cobden understood was the power of trade and of commercial civilization. In promoting the triumph of this power he was fighting in his own eyes on behalf of all the virtues which could bless mankind. It was inevitable that he should fall into the error of overrating the benefits of material progress. Popular judgment is rarely, in the long run, utterly at fault, and the popular belief that the Manchester school and their leaders were prepared to place free-trade and peace above every other consideration, was as wide-spread as it was well founded. Cobden and his followers had no hand in the great European movements which have changed the world within the last thirty years. The resurrection of Italy, the consolidation of Germany, the desperate efforts of French Republicans to establish a rule of law and freedom in France, the deadly conflict between the pretensions of priestly intolerance and aggressive rationalism which still distracts the world, have for the last thirty years occupied the minds and thoughts of statesmen and nations. But with none of these things was Cobden, for all that appears, greatly concerned. If he felt sympathy with the Continental struggles for freedom and national independence, he gave scant expression to his feeling. It is almost impossible not to believe that the contests which divided Europe into hostile camps seemed to him an irrational interference with the progress of commercial enterprise, and with the diffusion of sound economical doctrines. Gradually the great free-trader and his friends came to occupy the position of preachers whose sermons, however good in themselves, did not meet the wants of the day. "Free-trade, peace, and non-intervention" make at times not a bad formula for the guidance of statesmen, but there are many crises to which the formula is quite inappropriate. It was not calculated to aid men engaged in overthrowing the tyranny of Austria; it was not a formula suited either to console or encourage Frenchmen writhing under the base despotism of the Empire. Yet Cobden, with the assured faith of a religious zealot, tendered peace and free-trade to all men at all seasons, and never showed that he felt a qualm in negotiating with the French emperor a treaty to which the French people would, if their voice could have been heard, have probably refused consent. The treaty (it will be said) was for the benefit of France. If this had not been the case the transaction would have been infamous; but even as matters stood, there is something singularly unpleasing in the friendly relations between the English democrat and the French tyrant. The negotiations, Mr. Ashworth tells us, were impeded by the fact that the English Ministry thought it necessary to arm the country against an attack from the ally with whom Cobden was negotiating a treaty of commerce. Mr. Ashworth sees in the conduct of the Cabinet nothing but perfidy and folly. Men who have not forgotten 1870 may think that England still owes more gratitude to Palmerston for his armaments than to Cobden for his treaty.

Curiously enough, Palmerston and Cobden are almost the only English statesmen of high reputation who can be reproached with excessive trust in Louis Napoleon. But if Palmerston's admiration for the hero of the *coup d'état* betrays moral callousness, his later attitude of watchful suspicion exhibits something of statesmanlike caution. Cobden's relation to the Emperor does not involve the same recklessness of principle which was manifested by a tender of sympathy to the blood-stained president; but it does suggest that Cobden shared in a degree the peculiar failing of religious or philanthropic reformers. Their weakness is rarely hypocrisy; it far more often consists in the tendency to disregard every consideration but the promotion of the cause or creed to which they are devoted. Penn at the court of James II., Las Casas introducing negro slavery that he might mitigate the sufferings of the Indians, Burke making himself the defender of the most worthless nobility in Europe, are not agreeable pictures; and side by side with them must be placed the picture of Cobden welcomed to the Tuileries and carrying on confidential communications with that high-toned patriot, M. Rouher. Cobden's best defence, however, is to be found in his own words: "We have no desire to be politicians." He was the prophet and teacher of one set of ideas; he was not and did not pretend to be a statesman.

BOOKS OF THE WEEK.

Fine Arts.

THE LOAN EXHIBITION AT THE ACADEMY OF DESIGN.—II.

JUST before the first article of this series was put into type the large South gallery was opened, and its contents added to the Loan Exhibition. A part of the wall-space here has been devoted to a collection of prints, the first serious and orderly exhibition illustrative of the engraver's art that has ever been held in New York, or, so far as we know, in America. As such, it is especially important to all lovers of fine art, few of whom have any opportunity of seeing fine prints, except in the slight and passing way possible in the shops of our two or three dealers in such things. It seems best to disturb the order of precedence, and treat at some length of this collection, as it will remain open only until the 12th of January, and as it is well worth a journey from a good way out of town.

The prints are secured directly to the wood-covered walls of the gallery by tacks and pins through their mounts, and are protected by plate-glass in hinged frames. They are packed as closely as possible, the mounts and margins overlapping one another, so that each frame, containing about fifteen square feet, is made to hold from ten to twenty prints, or even more than twenty in those instances where several smaller prints form a series and are secured to one and the same mount. It appears that still greater economy of space would have been possible had each frame been glazed with a single large light of plate-glass in lieu of four smaller pieces, because the necessary sash-bars interfere greatly with the ordering of the prints, and it is evidently easier to arrange twenty pieces of irregular shape and size economically in one large space than in the four quarters of it.

The numbers begin on the left, as one enters the South gallery from the corridor. The first case, No. 1122 of the catalogue, contains fourteen prints "by early Italian masters"; viz.: two impressions of *nielli*, very fine and characteristic, one Baccio Baldini, one Mocetto, two Mantegnas, one Pollaiuolo (and not Pollainolo, as the catalogue has it), two Marc Antonios, and five by Marc Antonio's followers, Veneziano and Marco da Ravenna. There are a dozen more prints by these last-named three masters in the cases which follow, but there are no more of the earliest Italian prints than the seven above named. It is fortunate that those few are good specimens. The Mantegna is that magnificent "Entombment of Christ" (No. 3 of Bartsch), which must always be a prime favorite with all lovers of early art. There is no Mantegna, and perhaps no Italian print of the first epoch, more important both as a work of fine art and as a specimen of primitive burin-work on copper. The impression in the Academy collection is good and clear, without being one of those rare and priceless copies of extraordinary brilliancy which, in the case of these early prints, are almost never seen. The Baldini is from the edition of 1481 of the *Inferno* of Dante, and is the vignette or illustration of the second canto (Bartsch, 38). Sandro Botticelli, an artist of great and deserved renown, and one of the most able of early

Italian painters, is supposed to have worked with Baldini at the illustrations of this book, and at other prints, many of which, though generally known as the work of the last-named artist, are claimed by many scholars as the work of Botticelli, the rather that they show extraordinary powers of poetical and imaginative design. The print before us is hardly one of those, but a literal enough setting-down of the leading incidents of the second Canto. Virgil exhorts Dante to follow him through the inscribed gate to the lower world; Virgil points out the visioned Beatrice as having sent him to Dante's aid. As the only specimen here of the earliest Italian artist who engraved on copper with the intention of printing off impressions on paper, this work should be closely examined. A comparison of its workmanship with that of the *nielli* is advisable. It should be remembered that the silver engraved plates from which the prints, "An Emperor and Followers" and "A Papal Conclave," have been printed or rubbed are of even date with this Baldini, or only a very few years earlier, but that they were engraved exactly as a coat-of-arms on a spoon is engraved, for the ornamenting of the piece of silver, and that the impression on paper is a secondary matter, either made by way of a "proof" to see how the work got on, or to send a picture of the silver-work to a distant possible customer, or, most probably, made after prints from engravings had become a new and splendid addition to the body of fine art, and when they were sought by art-lovers in the spring-time of the Renaissance. Comparing this, then, with the Baldini print, where the print itself has been the object in view from the beginning, the whole change in plan of the Italian engravers becomes evident, and the origin, in Italy at least, of engraving for printing, is seen as no description can show it.

The next step is taken in those works of Pollaiuolo (only three actually identified) of which the "Combat of Gladiators" here is a favorable specimen. This master had a name among painters as an ardent student of the newly-developed science of perspective, and as an anatomist. Evidently he was very little of a poet, and drew little on imagination for his designs, a hard and matter-of-fact draughtsman. With all its shortcomings, however, this bloodthirsty design is most interesting, and could hardly have been spared from the case; and it is to be regretted that we have nothing of the school of Central Italy to fill the gap between the two masters we have been discussing and Marc Antonio, some fifty years later. In default of such prints, we have the Mantegna above spoken of and the fine Mocetto, a print not known to Bartsch, but described by Passavant under No. 11 of his list. These two are of the schools of Northern Italy; and it is interesting to think of Milan and Venice as the homes respectively of Mantegna and Mocetto, two cities where such splendid manifestations of the highest possible power and glory of art were soon to be made.

Marc Antonio Raimondi, with his pupils and followers, forms the most celebrated epoch of Italian engraving; but this is as much because of the circumstances of his time and of his career as from extraordinary gifts of his own. As a master of the burin he hardly equalled the greatest Germans of his own or even of an earlier time; his approximate correctness of drawing was not his peculiar skill, but a power at that time growing common in Italy; what there is in his work of fine design, lofty conceptions, imaginative treatment, can only be referred to the drawings of Raphael and other great painters of the time, whose drawings were freely given him to copy. His dexterity and readiness were so great, however, as to place him at the head of Italian engravers of his age; and although Bartsch makes no attempt to distinguish between Marc Antonio's own work and that of Marco Dente da Ravenna and Agostino di Musi Veneziano, later writers have wholly rejected the common numeration of the three given by Bartsch, and have discriminated. In case 1123, the lowest line is occupied by two important prints, the "Parnassus" (Bartsch 247, Passavant 128; one of Passavant's many errors is the referring to this print as Bartsch 274), engraved after a design of Raphael, which the great Roman deviated from widely in his fresco in the Vatican; and the "Judgment of Paris" (B. 245, P. 137). Immediately above these prints are the "Saint Cecilia" (B. 116, P. 51), also from a drawing of Raphael which differs, though but slightly, from the Bologna picture, as well as from that at Munich; and the famous "Cassolette" (B. 489, P. 278), a perfume-burner supported by three caryatides, which design is alleged to have been made by Raphael for Francis I., probably to be carried out in silver. These four prints are admitted on all sides to be by the hand of Marc Antonio himself, and it would be hard to select four more characteristic examples; the student can form his general impression of the school and its thousand prints as well from these as from a larger list; though he should examine also the copy after Albert Dürer, "Virgin and Child with Angels" (B. 639), as an instance of a most curious series of copies which the Italians made from the Nuremberger's prints of both wood and metal engravings.

It is rather to be regretted that none of Marc Antonio's portraits are here, for as we go on to the following cases there are other and most interesting Italian portraits with which they should be compared. In cases 1124 and 1125 are several; but there is an unfortunately long lapse of time between Marc Antonio and the earliest of these. This *earliest* we take to be the tenth in case 1124, the portrait of Raphael by Bonasone (Bartsch 347). Ghisi's portrait of Michel Angelo (Bartsch 71) can have been but little later; it is the well-known head, often copied, representing the artist as an old man with bristling hair and beard, looking out from an oval frame. The portrait of Cosimo de' Medici, by Agostino Caracci (not A. Veneziano, as the catalogue has it), numbered by Bartsch 140, and set down to the year 1581, follows, and is followed by the fine print above, Alberti's Henry IV. of France (B. 124), with its elaborate *cartouche*, and dated 1595. In case 1125 a similar print and earlier (the two should change places) is the Charles V. of Æneas Vico (B. 251). And we must conclude what there is to be said of these too-fascinating portraits by an allusion to the stately engravings after Titian by an engraver, not an Italian, indeed, nor a contemporary, but one who worked in the same spirit, Cornelius Van Dalen. These large heads of Boccaccio, Giorgione, and Pietro Aretino are rightly enough put here, to accompany the other prints in whose spirit they were made, rather than with the Flemings of a hundred years later.

On the opposite side of the gallery, case 1126 begins the German school with nineteen prints. One is vexed by the necessity of putting some of these so high, for the delicate prints by Martin Schongauer can hardly be seen. Not that the arrangement of the case was in fault, except that the "Baptism of Christ" (Bartsch 8), which is probably at once a more valuable print and, in this instance, a more perfect impression, should have been substituted for "The Nativity" (B. 5). The curious print (B. 88) the "Peasant going to Market" ought also to be seen closely. But it was necessary to put the Van Mekenen print low, no doubt, for though they can never compare in beauty or artistic merit of any kind with those of his contemporary Schongauer, they have an especial importance in a public collection on account of their rarity and high price, which keeps them out of the hands of most collectors, except a piece or two of the less important. Besides the prints of these two masters there are only in this case one playing-card of a set engraved about (*circa*, not "corea," if the catalogue-maker please) 1470: a round Jack of the suit of lilies; and one print by Franz von Bocholt, "Samson and the Lion" (B. No. 1), a specimen of no great importance. It is to be regretted that what could have been easily done was not done—more very early and anonymous prints put here, in lieu of some of the Schongauers and Van Mekenens. Of course, they are left out because they are not pleasing to the general taste; but neither are those which are put in very generally pleasing, and a dozen early playing-cards would have fitted into a small space, and have been so important in the series.

But with cases 1127 and 1128 we come to a master whom everybody is proud of—Albert Dürer, the general favorite, of whose work, with a proper deference to a fame which is alike popular and secure in the approval of the judicious, no less than thirty-six specimens are given. It is unnecessary to enumerate even a part of them, for there are many books in circulation which treat of Dürer and his work, and it seems to be sufficient to say that the thirty-six here have been chosen among the most important engravings on metal, and include the *celebrities*, the Melancholia and the Knight of Death, the two Saint Jeromes; his largest print, the St. Eustatius or St. Hubert; his finest, the Adam and Eve, the Prodigal Son, and the Great Fortune. Many persons will miss the Little Passion, however, and it is a pity that the master's most splendid portrait is left out, the Erasmus writing at his table. Portrait-engraving is never more attractive than in Dürer's hands, though there are traditions to the effect that Erasmus did not like his own. Dürer spent none of his strength on borders and ornaments, and but little on accessories of any sort, for the dress, the table, and the few flowers and books in the Erasmus are more than he gives in any other portrait; but the essentials of each presentment are given with what seems a fidelity all his own, while yet he knows how to reach a delicate charm of manner far beyond what his contemporaries dreamed of. Years have to pass, and the great Rembrandt to be born, and to grow to full strength, before better engraved portraits than Dürer's are seen; and with Rembrandt dies the supremacy.

Dundee Marmalade,

By the celebrated makers, JAMES KEILLER & SON.

NEW SEASON, DELICIOUS, *ex* Steamer.

JOHN DUNCAN'S SONS,
UNION SQUARE.

Letter from Sir Henry Halford, Captain of British Team.

GARDEN CITY HOTEL, CREEDMOOR, Sept. 17, 1877.

Messrs. WM. S. KIMBALL & CO., Rochester, N. Y.:

GENTLEMEN: Pray accept my best thanks for the package of Vanity Fair Tobacco which I found here yesterday. It is the best tobacco I ever smoked, and will be a great source of enjoyment to me on my Western trip.

Believe me, yours truly, H. S. J. HALFORD.

SILVER

Plated Ware.

THE

Meriden Britannia Company,

46 EAST FOURTEENTH STREET
(UNION SQUARE)
AND
550 BROADWAY, NEW YORK,

Are Manufacturing and have on Exhibition a Choice Selection of Desirable Articles especially appropriate for Gifts.

CENTENNIAL MEDALS AND DIPLOMAS were awarded to this Company for "SUPERIOR" SILVER-PLATED WARE.

Pratt's Astral Oil.

PERFECTLY SAFE.

Especially adapted for use in the St. Germain Student Lamp.

CHAS. PRATT & CO.,
Box 3050. NEW YORK.

FOR FLORIDA

AND

ALL POINTS SOUTH.

PASSENGERS AND FREIGHT.

Via NEW YORK AND SAVANNAH STEAMSHIP LINES,

Sailing from New York punctually at 3 P.M. every Tuesday, Thursday, and Saturday, and connecting at Savannah with

THE CENTRAL RAILROAD OF GEORGIA

to all points in Georgia, Alabama, Louisiana, and Mississippi, and with the

ATLANTIC AND GULF RAILROAD

to all points in Florida, Southern and Middle Georgia, etc., and with the

GEORGIA AND FLORIDA INLAND STEAMBOAT CO.

Steamers: *City of Bridgton* and *David Clark.* For Freight or Passage by Thursday's ships, apply to MURRAY, FERRIS & CO., Agents, 62 South Street. By Tuesday and Saturday's ships, apply to GEO. YONGE, Agent, 409 Broadway, and at Pier 43, North River. C. D. OWENS, Agent A. & G. R. R., 315 Broadway.

For Portland (Oregon) and San Francisco, via Straits of Magellan and Valparaiso.

The elegant new steamship OREGON, Captain Conner, will sail as above from New York about the 15th of January. For freight or passage apply to

FREDERICK C. SCHMI[illegible]
No. 1 South W[illegible] Street.

NORTH GERMAN LLOYD STEAMSHIP COMPANY,

FOR SOUTHAMPTON AND BREMEN.

The Steamers of this Company will sail e[illegible]aturday from Bremen Pier, foot of Third Street, Hoboken.

RATES OF PASSAGE TO LONDON, [illegible]RE, AND BREMEN.

First Cabin, $100; Second Cabin, $60 gold. S[illegible]e, $30 currency. For Freight or passage apply to

OELRICHS & CO., [illegible]NTS,
Bowling Green

CUNARD LINE.

ESTABLISHED 1840.

FOR QUEENSTOWN AND LIVERPOOL

Sailing from New York every Wednesday. From Boston, once a week.

RATES OF PASSAGE:

CABIN—$80, $100, and $130, gold, according to accommodation. Return tickets on favorable terms.
STEERAGE—$28 currency. For freight or passage apply to

C. G. FRANCKLYN,
Bowling Green, New York

I. REMSEN LANE, Secretary.

The Nation.

NEW YORK, THURSDAY, JANUARY 10, 1878.

The Week.

CONGRESS meets to-day, and there is, of course, a great variety of opinion as to the effect of the recess on the attitude of members towards the silver question, but the preponderance seems to be in favor of a decline in the fervor of the supporters of the movement and a corresponding improvement in the chance of the defeat of the Bland Bill. Like all compounds of fraud and folly it suffers greatly from discussion, so that time runs against it. We think we see an abatement in the ardor even of the Cincinnati *Commercial*, and in that amazing credulity about the "conspiracy" which has reminded so many people of scenes in the history of the Commune, when every day produced a new story of "plots" and treason directed against "the people" by the bankers, lawyers, judges, priests, soldiers, shopkeepers, and, in fact, everybody who followed a regular calling and liked to know beforehand where he would get his dinner. The bankers in the large cities, we are glad to see, are beginning to bestir themselves. A meeting was held in this city on Saturday which was attended by representatives of twenty-seven of the leading banks, and appointed a committee to recommend suitable action in a report to be presented to an adjourned meeting on Wednesday. This step has been promptly seconded by the Banking Association of Boston. The New Orleans Clearing-house Association have passed resolutions denying that the South is favorable to the silver movement, and denouncing the Bland Bill in unqualified terms. The way in which all banks and moneyed corporations can best help to defeat the silver-men is, as we recommended long ago, to make no time-loans except in gold. This is a legal, feasible course, and would reduce the silver legislation, even if carried out, to mere wind in the course of six months. Mr. Winston, the President of the Mutual Life Insurance Company of this city, reports to his Financial Committee that the passage of the Bland Bill would reduce the value of the assets of the Company by $4,200,000, which would come not out of the pockets of "money sharps," but out of the fund which guarantees the provision made by vast numbers of hard-working men for their widows and orphans.

Rumors still continue to come from Washington of approaching revelations, based on the Chandler letter, of corrupt bargains between the friends of the President and the Southerners of both parties in order to secure the undisturbed possession of the Presidency. The bargain with the Louisiana Returning Board, which Chandler says Hayes broke, was, if made, undoubtedly corrupt, and, if provable, would be an impeachable offence; but nothing can better illustrate the moral condition of the Republican leaders than the fact that this consideration apparently never occurred to Chandler, and that he accuses Hayes not of having made the agreement, but of having violated it. His bringing the charge at all, however, shows that the men who engineered the Republican campaign are disappointed in Hayes, and are now ready, if they see a chance, to ruin him, even if they make nothing by it. This alone is what makes an investigation at all probable. If the Republicans are willing to expose their own corruption, of course the Democrats will not object, and then enough excitement and discredit for the Administration would grow out of it to turn popular attention away from reform, and make all further efforts in that direction impossible.

Mr. Halstead's assertion, in his late letter to the *Nation*, that he had "advertised in vain for a member of Congress who can say that he voted for the demonetization of silver, knowing when he cast his vote what it meant," is a method of proving that silver was "surreptitiously" demonetized of such exceeding simplicity that we have never thought it worth much notice, particularly as one of the most blatant silver agitators, Mr. William D. Kelley, was chairman of the committee which recommended the demonetization, and supported it in a speech from which we have already published extracts, declaring that he had never given any bill such careful examination. Anybody who can tell now why this eminent man does not come forward in answer to Mr. Halstead's "advertisement" and claim the reward, can explain also the silence of scores of other Congressmen who probably understood the subject just as well as Kelley. Anybody can guess the reason of this silence. This mode of discussing a financial question is, however, so puerile that we feel a little ashamed of taking part in it.

A telegram from Washington to the New York *Tribune* of the 3d inst., drawn out by Mr. Halstead's letter, quotes from the speeches of Messrs. Kelley of Pennsylvania, Potter of New York, McNeely of Illinois, Hooper of Massachusetts, and Stoughton of Michigan, showing that these at least knew perfectly well what was going on. The despatch shows also that the proposal to demonetize was fully discussed by three ex-directors of the Mint, the Superintendent of the New York Assay Office, Mr. E. B. Elliott, Mr. Robert Patterson, and others in a report to the Secretary in 1870. The *Banker's Magazine* also published, in July, 1870, the report of the Deputy Comptroller of the Currency explaining the object of the demonetization bill. In the following year it published the correspondence of the Deputy Comptroller with several persons, in which the object of the bill, as regards demonetization, was again explained. The New York Chamber of Commerce discussed the bill ten months before its passage; the National Board of Trade discussed it six months before its passage; and a paper of Mr. Samuel B. Ruggles discussing it was in December, 1872, mailed to every member of Congress. What is the answer to all this? Why, "gold plot," "goldites," "gold sharks," "money kings," "gold-bugs," "dollar of our fathers," "fraud," "laboring man," "toiling millions," "Mississippi Valley," "silver eagle, one wing in Gulf of Mexico, the other in Lake Superior, tail in the Rocky Mountains," "bloated bondholders," "coupon-clippers," "sponge," "bloodshed," "anarchy"; and the people from whom this comes are not French peasants, or Russian Muzhiks, or Parisian Jacobins, but Americans bred in the common schools and long used to self-government.

The question of the Texan frontier disturbances has been again under consideration by the Cabinet during the week, as well as by the House sub-committee on military affairs; and the more it is examined the less cause is there for any heat about it. The Cabinet had laid before it two letters from the collector of customs at El Paso, giving a lucid account of the origin of the salt troubles, and for the first time bringing to light their political aspect. It appears that the salt lakes a hundred miles from El Paso, after having from time immemorial been freely visited and worked by the inhabitants of both sides of the Rio Grande, chiefly Mexicans, were thrown open to "location" by private parties by the Texas Constitution of 1868. In the effort to avert this the Texas Mexicans fell a prey to "designing politicians," who, in return for their votes, promised to obtain for them from the State the absolute right and title to the region. Partly through the usual faithlessness of demagogues, and partly because of the obstacles they encountered, the law remained unchanged. The Texas-and-Pacific road had meantime been granted these "lakes," so that no State patents could be issued for them, and, failing to be built beyond Fort Worth, it could not procure sufficient State certificates to meet the demand. When at last locations were obtained by an Austin company, they sent an agent, one Howard, to look after their property and keep off trespassers. Howard stationed himself at El Paso, and provoked an outbreak by persuading the county judge to order the arrest of men who had

merely threatened to go to the lakes in company with the rest of the town. Then followed mob violence, beginning with the arrest of the judge and the seizure of the agent, who had sought refuge with the sheriff; his confinement at San Elizario until he promised to admit free access to the lakes; his withdrawal to New Mexico, and subsequent return to El Paso, where he met and killed Mr. Cardis, the adviser of the Mexicans. For this act Howard was under bonds to appear in court next March, when, in December, with the support of some Texan rangers, he insultingly went to San Elizario to ensure the arrest of parties about returning to that place from the lakes. The result was a collision, in which, as is well known, the rangers were surrounded and forced to surrender, and Howard himself was taken and shot. In this mêlée there is no doubt that some Mexican citizens participated.

Secretary Schurz has taken the first step towards a thorough purging of the Indian Bureau. Unlike his predecessor, Mr. Delano, he formed his investigating committee with a view to discovery and not to whitewashing, making it consist of the chief clerk of the Interior Department, an army officer, and a member of the Attorney-General's office. We are sorry to say that the result shows that neither the piety of Commissioner E. P. Smith nor the high business capacity and perfect integrity of Secretary Chandler sufficed to fathom the depths of iniquity of the Bureau, and that the efforts of the unpractical doctrinaire who now controls the department to accomplish the same end were crowned with success, in spite of his enquiry being "hindered in every conceivable way" by the employees under inspection. The chief clerk of the Bureau, S. A. Galpin, is acquitted of personal corruption, but is censured for having kept back charges that were filed against certain fraudulent contractors (on the ground that he knew the persons and believed them innocent), and with having improperly delegated his authority in order to go home to vote. The committee find the correspondence, filing of papers, and general business routine of the Bureau to have been shockingly irregular, and exactly adapted to foster corrupt combinations within and without; a "group" was formed, with clerk Galpin at its head, which gave direction to all matters of importance that passed through the office. The Annuity Clerk, who had been employed for twenty-one years, received blankets and other presents from contractors, and openly expressed his regret that the "good old times" when such practices were innocent had passed away—a sentiment which at once cost him his place. Even the stenographer was more than a mouthpiece, and was privy to what went on behind the scenes. The letting of contracts in New York was entrusted to a clerk of no business experience, who kept no official record of bids or shipment of supplies, etc. Collusion between traders and agents in the purchasing of needed supplies in open market at the eleventh hour; frauds in weighing cattle; unsettled accounts of long standing; unchecked expenditures by agents —in one case of $500,000; frauds in the disbursement of "miscellaneous receipts"; appointment of traders without approved bonds, or with the approval in excessive number by one agent, who could not possibly have verified them; collusion with traders in paying Indians for labor with tokens instead of in cash, and false returns for such outlays to the Bureau—complete the dismal tale, which no "Pi-Ute" levity can dispose of. That Mr. Schurz will follow the recommendations of his committee without delay is perfectly understood in the Indian Bureau.

Governor Rice, of Massachusetts, was suspected before his recent election of lukewarmness and hostility towards civil-service reform as defined in the Republican platform and Mr. Hayes's letter, but he managed with great skill to put the charge aside. He has now in his message thrown off all, or nearly all, disguise in the matter, and ranged himself virtually on the side of Conkling and the Chandlers. He is, however, very gentle and tentative in his opposition, as becomes so friendly and conciliatory a man. What he says is "that it has sometimes appeared [only "sometimes"] to those who have given thought to the matter," that the reason why civil-service reform has not succeeded is, "that it would engraft on our republican government the characteristics of the civil service of monarchies." You see, he does not mention what these "characteristics" are. "Many of the complaints," he adds, "made against the American civil service are complaints against the republican form of government itself," and so on, the old story. Now, we suggest to the Governor that he shall lay his hand on his kindly heart and ask himself these questions, as a means of getting to the bottom of this troublesome question: As a matter of fact, was the present "spoils system," as it is called, introduced, like the election of members of Congress, for instance, into this Government deliberately, as part and parcel of republican institutions, and with the view of promoting republicanism? If not, how, by whom, and for what reasons was it introduced? In what way does the American people profit by it, and how would the American people be injured by the proposed changes? If the interests of the majority, such as economy, accuracy, fidelity, and honesty, are not tests of the republicanism of a service, what are those tests? We are greatly afraid that "those" whom the Governor quotes are not persons who "have given thought to the matter." They have been imposing on him. What they have been telling him is mere gossip they have heard from Messrs. Butler and Boutwell. There is no second opinion among those who "have thought about the matter."

Mr. Bancroft Davis has made a contribution of considerable importance to the Sumner-Motley-Fish controversy, which will probably end it. He recalls the fact that Mr. Sumner, in his speech in April, 1869, on the Johnson treaty, in stating the case against England, put down her liability to the United States in this way:

Loss of ships	$15,000,000
Loss in the carrying trade	110,000,000
Loss through prolongation of the war	2,000,000,000
Total liability of England	$2,125,000,000

or about £425,000,000 sterling, being considerably more than half the present national debt of that country. This speech was delivered without consultation with the Administration, but attracted much attention, as coming from so responsible a person as the Chairman of the Senate Committee on Foreign Affairs, and of course seemed to make settlement by negotiation hopeless, as it would have been cheaper for England to fight three campaigns than settle with Mr. Sumner. The Crimean War only added $500,000,000 to her debt. He also laid it down that the concession of belligerency was the first and great source of England's pecuniary liability.

Before the speech, Mr. Motley had been sent to England on Mr. Sumner's earnest recommendation, and Mr. Sumner's repeated attempts to draft his instructions making the belligerency proclamation a grievance sounding in damages had been repelled, and Mr. Fish drafted them himself, with one or two unobjectionable passages of Mr. Sumner's inserted. How, in spite of this, being strongly under Mr. Sumner's influence, Mr. Motley kept injecting the belligerency matter into his communications with the British Government, and how after several threats and rebukes he was finally recalled with needless contumely, is a story known to everybody. The President, who disliked him, wished to recall him in October, 1869, but was prevented by Mr. Fish's remonstrances. He was actually recalled on July 1, 1870, immediately after the rejection of the San Domingo Treaty, June 30, 1870. Naturally enough, the rejection of the treaty under Mr. Sumner's attacks has been looked on as the cause of the removal, and it probably did precipitate it; but that it was determined on previously, and if Grant had had his way would have taken place, Mr. Davis's statement seems to leave no doubt.

Now comes the question of the cause of Mr. Sumner's removal from the chairmanship of the Committee on Foreign Affairs. This has been treated, not unnaturally too, as the result of the President's and Mr. Fish's hostility, partly personal

and partly owing to the San Domingo Treaty. Mr. Davis shows, however, that in January, 1871, the Administration being desirous of negotiating a settlement of the Alabama quarrel, Mr. Fish sought, and obtained through Senator Patterson, a friendly interview with Mr. Sumner, and submitted to him the ideas of the Administration with regard to that settlement. Mr. Sumner took time to consider them, and then sent a "memorandum" to Mr. Fish, now for the first time published, containing what Mr. Sumner considered the essential basis of negotiation. One was the absolute withdrawal of the British flag "from this hemisphere, including provinces and islands," as "a condition or preliminary." Another was the prohibition of a discrimination in favor of claims arising from the depredations of any particular ship—or, in other words, Great Britain was to acknowledge herself responsible in the lump for the depredations of *all* the ships which preyed on American commerce. Of course this plunged poor Mr. Fish in despair, and he was only reassured by finding that the rest of the Senate did not share Mr. Sumner's views, and would support a reasonable treaty; but they determined of their own accord, Mr. Davis says, that under the circumstances Mr. Sumner's presence at the head of the Committee on Foreign Affairs was out of the question.

The conclusions which we believe most unprejudiced persons will draw from the whole story are two: one is that Mr. Sumner's speeches both on the Johnson Treaty and on the San Domingo Treaty showed that in 1870 and 1871, or thereabouts, his mind had to a considerable degree lost its balance, and that the "memorandum" was simply a fresh illustration of the disorder in his sense of proportion; the other is that during the anti-slavery conflicts and the war Mr. Sumner's earnestness and vehemence were so well suited to the times and to the work he was engaged in that they concealed from his friends and the public, and probably from himself, his incapacity for affairs of greater delicacy and complexity. We may add that his plan of having Great Britain withdraw from this continent was not kept to himself in 1871. It appeared, we believe, in the columns of the New York *Tribune*, the then excitable manager of that paper evidently considering it A Mighty and Pregnant Idea.

Although there were many failures during the week there were none in Wall Street of sufficient importance to unsettle the Stock Exchange. The revelations of the Bonner failure, however, were so shocking that until late in the week there was great difficulty in making loans, and the rate for money advanced to one-quarter of one per cent. per day. This was an extreme rate, but $\frac{1}{2}$ to $\frac{1}{6}$ per day was common until late in the week, when loans having been very generally examined and no other frauds discovered, something like confidence returned and money lent at 6 to 7 per cent. This disturbance in the money market lowered the rate of sterling exchange and depressed the price of United States bonds, but had no effect on speculative stocks, which were not only held up but were advanced. Without doubt, too, it prevented gold from selling as high as it otherwise would have done early in the week. After it became known, however, that the bankers and merchants of New York and the Atlantic cities had resolved to move against the silver scheme, confidence in the defeat of the Bland Bill appeared and the price of gold fell to 102½—or within one-eighth of the lowest price since early in 1862. The efforts to form another coal combination came very near being successful—so near that it is a question whether a combination may not yet be perfected. In London, consols advanced one-half to three-fourths on the improved chances of an armistice. Silver in London was weak, closing at 53⅝ to 53¾*d.* per ounce—a price which would make the gold value of the bullion in a 412½-grain silver dollar about 89¾ cents. At the close the gold value of a United States legal-tender note was $0.9756.

Our London correspondent describes the political situation in England very fully. The only thing to add to it is that the pro-Turks still hug the theory that the war has been a sort of trial of strength to see which fought best, and the Turk, though defeated, having shown himself a good fighting-man, ought now be let alone. The Russians themselves are somewhat to blame for the currency of this view by the extraordinary mildness with which they have submitted to Turkish modes of warfare. They flattered and patted Osman Pasha on the back after his surrender, as if he had shown himself a Bayard, although he had not only allowed the Russian wounded, after each assault, to be butchered on the ground, but had refused to permit the burial of the dead, so that when he laid down his arms the hill-sides were covered with Russian skeletons. His defence was no braver or better than scores of Turks have made, not so brave or determined as that of Varna in 1828, and had the Germans taken him after his atrocities they would certainly not have complimented him on his bravery, or sent him to prison with a guard of honor. He fought well, to be sure, but did not Tamerlane and Genghis Khan fight well? Similar weakness on the Russian side was shown at Telis, where, after the first unsuccessful attack, the garrison, to the horror of the two English surgeons who were with them, sallied out and slaughtered the Russian wounded, and in some cases resorted to the playful little Indian trick of lighting fires on the stomachs of living men. The Russian officers knew this when they took the works, and yet restrained their men and allowed the Pasha to surrender his sword instead of knocking him on the head, as Germans or Frenchmen, and most certainly Englishmen, would have done. We are glad to see that Shefket Pasha's failure in the field has been ascribed to the fear of being caught, he having superintended or ordered the massacres at Batak; but he evidently overrates the Russian capacity for honest wrath.

General Gourko, after crossing the Balkans, fought a severe battle on December 31 before Tashkesen, at the junction of the roads from Orhanie and Zlatitza to Sophia, where the Turks had intrenched themselves. The latter retreated at nightfall. Gourko, who reports a loss of seven hundred killed and wounded, halted for rest and reorganization, and then resumed his march on Sophia. The Russians having received heavy reinforcements from beyond the Balkans, though at a great sacrifice of men perishing or disabled by the cold, the Turkish force which held the position near Komartzi retreated eastward to Zlatitza. From other exposed positions the Turks had gradually withdrawn towards Ikhtiman, midway between Sophia and Tatar Bazarjik in Rumelia, which is becoming a principal point of concentration. On January 2 the Turks made an attempt to surround five battalions of Russian infantry and a brigade of cavalry at Bogrov, about twelve miles east of Sophia, but were driven off after a desperate engagement, leaving a thousand killed on the field, as the Russians report. On the following day Sophia was entered by General Gourko, after a light skirmish before its gates. The city had been completely evacuated. Some days later, the force which had retreated to Zlatitza was, after severe fighting, forced to abandon that place as well as Petritchevo, south of it, and fell back on Poibren and Otlukköi, respectively about ten and twenty miles northeast of Ikhtiman, where they occupied "strong positions."

The unopposed crossing of the Shipka pass by General Radetzki has been reported from Bucharest in an unofficial way, but a telegram from the Turkish camp at the pass contradicts the news. Gourko, meanwhile, may wait for fresh succor, or he may possibly detach some troops to effect a junction with the Servians, who have suffered a severe check in the recapture of Kurshumlie by Turkish troops from Novi-Bazar, after two days' sanguinary fighting. On the plain of Erzerum the Russians, operating on the north bank of the Kara Su, or northern branch of the Euphrates, advanced to the road to Baiburt and Trebizond, where it crosses the river near Ilidja, northwest of Erzerum, but suffered a disastrous repulse, according to a Reuter telegram—which must be received with caution. Mukhtar Pasha seems to have been recalled, and changes in the command of the Turkish armies in Europe are also reported, including the placing of Suleiman Pasha, as commander of a corps, under Raouf Pasha, as general-in-chief in Rumelia.

THE REPUBLICAN SENATORS AND "HARMONY."

OUR readers may remember that when the late Mr. Jenckes was agitating the question of civil-service reform ten years ago, the great obstacle in the way of any change was the difficulty of producing a bill that would satisfy members of Congress. There was hardly one of them who was not in favor of reform in the abstract. He saw the need of it just as clearly as Jenckes himself, and desired it just as ardently. What troubled him was "the particular measure" of reform then under consideration. He could not for the life of him make up his mind that this or that bill or scheme would supply the desired remedy. It was very soon discovered, too, that there was no use in amending or altering the bill or scheme, or drawing up another, because *any* bill or scheme was sure to prove defective. No "particular measure" would, in short, satisfy the average Congressional reformer, and the reason was that although in other things he was willing to take the world as he found it, and do the best he could with it, in this matter of civil service reform what he sought for was absolute perfection, and this thirst for perfection of course neither Jenckes nor any other man could slake. He would put it to Jenckes whether under the very system then proposed many incompetent and dishonest persons might not make their way into the public service, and poor Jenckes had of course to answer sorrowfully in the affirmative, and this admission brought the discussion for the Congressman to a triumphant close. "Produce me a scheme of reform," he would say, "which will effect an *absolute* purification of the public service, which will fill it with the good and competent, to the exclusion of all others, and you will have no more earnest supporter than myself. Until you do this I prefer to leave the service as it is."

The passion for perfection abated afterwards. At a later period the Congressional reformers began to say that the perfect civil service for which they sighed was, they saw plainly, not to be attained in this world. In a better one they hoped to see it, but not sooner. As far as the United States was concerned, it was a poet's, or student's dream, and they for their part were going to give up striving for it. They would think of it often on the river bank about sunset, and when sitting around the stove before the lamp was lighted, and would be touched by allusions to it in sermons, but they could not give any of their working hours to vain efforts to produce it. As the years rolled on, however, and abuses multiplied and were exposed, they were compelled to admit that something short of a perfect civil service might be desirable and attainable; that is, that improvements in the civil service were possible and ought to be sought. In this condition the Cincinnati Convention found them, and the result was the celebrated fifth resolution, which binds the party to effect certain specific but very radical changes in the mode of appointment and in the conditions of tenure. It is true that during the canvass they tried to divert attention from this resolution, but, as their ill-luck would have it, their candidate took it in sober earnest, and has set to work to carry it out. The problem now under consideration, therefore, is how to prevent the change in the civil service proposed by the Cincinnati platform. It will clearly not do to talk of these changes as a poet's dreams, or as only attainable in a future life among disembodied spirits, because the men who drew the platform, like all members of committees on resolutions, were practical, long-headed men, with sound brains, wide experience, and ready pens. The solution agreed upon is now plain to be seen, viz., to urge the unseasonableness of reform. That is to say, the Republican politician is now as eager for reform as ever, and as fully determined to bring it about, but is this the time for it? Is it expedient to push it at this particular juncture? Clearly not; and the reason is, that what we need most just now is Harmony in the Party, and the reason we need Harmony is that "the Solid South" is marching straight at the Government with the fixed intention of robbing the Treasury and making depreciated silver the standard of value. To undertake civil-service reform under these circumstances would, they say, be madness. They are not going to fight it, if they know themselves, but as practical men they see the necessity of "doing one thing at a time" and doing the most important thing first. Take, for instance, the case of Mr. Dawes, of Massachusetts. His passion for civil-service reform is well known. He has lain awake over that more than any other one thing except the butchery of negroes, which he knows is constantly going on at the South. Now what did he say the other day? Why, that civil-service reform, holy and noble as it was, must be postponed in order to resist the Solid South and the silver movement, and restore Harmony in the Party.

When one enquires into the exact nature of the connection between civil-service reform and Harmony in the Party one comes on some rather startling facts. We are told in plain terms, and apparently with entire unconsciousness of anything singular in the matter, that the Senators, if their share in the patronage is interfered with by the President, will not oppose the silver movement, and will let "the Solid South" have its way, so that when the President tries to appoint a collector whom Mr. Conkling does not like, he becomes morally responsible for the robbery of the Treasury and the repudiation of a portion of the public debt. Mr. Conkling and his Republican colleagues have, it seems, no duty of their own either towards the public credit or the civil service. *Their* oath of office places no direct responsibility on them whatever. They are bound to behave well and watch over the public interests only in case the President does not annoy them or meddle with them. Should he act injudiciously, their power becomes completely detached from duty, and they are at liberty to make any use of it they please. Nor are they called on to contribute in any degree to Harmony in the Party. Indeed, Harmony seems to consist solely in their having their own way. It is the President's sworn duty under the Constitution to select persons for certain Federal offices, and that of the Senators to advise him as to their fitness, and confirm them if they think proper. It would seem as if his performing this function, however unwisely, ought not to make the smallest change in the responsibility of the Senators as legislators. And yet it does. It destroys it, we are told, altogether. It justifies Mr. Conkling in letting the Solid South and the silver-men do what they please in everything, and in concentrating his whole time and attention on the custom-house of one city and the officers of one State. It even justifies him in total indifference to Harmony, that most terrible condition of the politician's soul. The care of Harmony is now thrown completely on the President, and he is asked every day with curses and execrations when he is going to be harmonious.

We would suggest, apropos of all this, to the bankers of this city and State who have been recently taking counsel, as it is most proper they should, over the silver question and its dangers to public and private business, whether they would not do well to put on record their view of the duty of the New York Senators, at least in a crisis of this kind, in national affairs. No State in the Union is so much interested in legislation regarding the currency and the public credit, and the amount and collection of customs duties, as New York. A very large proportion of the work of exchange with foreign countries is done in this city; so is a very large proportion of the adjustment of domestic accounts, and of the supply of capital for industrial purposes. One, at least, of the Senators ought to be a man sincerely and specially interested in finance, trade, and commerce, and keenly alive to every political movement or drift of opinion which seems likely to affect the currency or credit of the country, or the prosperity of this great port. Have the bankers observed that their "Senior Senator," the only one belonging to the party in power, has not during the last nine months of anxiety and alarm once opened his mouth about the dangers with which the country is threatened by schemes of repudiation and adulteration, or given the smallest sign either in public or private of knowledge of or interest in them? Have they observed that, as far as can be discovered, his brains and passions have been wholly absorbed in the work of keeping, in defiance of the President, a collector of customs in an office which he has held during the most corrupt period in its history,

when it was really used, to all outward appearance, almost as much for the annoyance and repression of commerce as for the collection of revenue? Do they not see that his success in this enterprise, discreditable as it is in itself, cannot but militate against future efficiency and reform, by destroying or greatly weakening the sense of responsibility in the chief officer of the Government, on whom the duty of selecting his subordinates has been specially laid by the Constitution? Can they think of anything more likely to lower the character of the Government and put the public credit in constant peril than the doctrine now preached, that any unwillingness of the President to part with this duty, or share it, justifies a Senator in the total neglect of his legislative functions, and complete indifference to the great financial interests of the nation? And if they see all these things, as we are sure they do, would not a word of solemn protest against this proposed conversion of the Senate into a body of ill-tempered office-jobbers, without honor or responsibility, be a very appropriate addition to their utterances on the proposal to pay the public debt in a depreciated coin?

THE GOVERNOR ON THE CITY.

GOVERNOR ROBINSON, in his message sent to the Legislature last week, calls attention anew to the condition of the government of this city, as we believe every governor has done at the opening of every legislature for the past seven years. The facts of the case, as he puts them, are these: Twenty years ago the embarrassments arising in the municipal administration led to the creation of legislative commissions to control various departments, and in this way nearly all the appropriate powers of the Common Council were finally transferred to the State capitol, until at every session the Senate and Assembly have to a large extent "presented the appearance of a board of aldermen and assistant-aldermen for the city of New York." The result has been disastrous. Within this time upwards of twenty-four hundred laws have been passed relating to the city. These have been in some cases so confused and so conflicting that the Court of Appeals has declared it to be impossible to ascertain their meaning. Of the city debt he estimates that $85,000,000 was imposed upon it by legislative acts for which the city never applied. He further expresses the opinion that of the twenty-four hundred acts referred to, the majority will be found intended to cover "mere schemes of plunder," or to "change official power from one class of men to another." He then refers to the fact that a number of bills relating to the city were passed by the last Legislature but vetoed by him, either as being unconstitutional, or as containing provisions designed to keep up "the old and corrupt system," and proceeds to enquire, "What now is to be done?" The answer which he gives to this question is remarkable for more reasons than one. He says:

"I am still of the opinion that the only effectual remedy for the evils under which the city suffers will be a careful and well-considered charter in the nature of a constitution, organizing a local government with a strong and responsible executive head; with a city legislature composed of two houses, and clothed with all the powers of local legislation, subject to veto by the mayor. I believe that such a charter may be easily framed, although it would be out of place to attempt to set forth the details of it in this message. When once fully and fairly considered and adopted, it is believed that the advantages of it would be so apparent as to induce steady adherence to it, and to the local government established under it, rather than to return to the dangerous experiment of passing local laws for the city of New York by members of the Legislature, three-fourths of whom know little of the wants of the city."

This proposal is based on the theory that if we can only go back to the point where the ways divided twenty years ago, do away with commissions created within that period, and get a good mayor, all will be well. This is a very favorite scheme of reform with Democrats, but it is open to many objections, the most serious of which is that it has been tried and failed. A good deal may no doubt be done in the way of strengthening the mayor's hands; but so far as the governor's plan involves a local legislature composed of two houses, it is precisely this kind of municipal government which completely broke down twenty years ago. The Democratic theory is, that about twenty years ago the Republicans, moved by that passion for misgovernment which, according to Democratic ideas, always possesses the "radical" mind, introduced all the present disorder and confusion which we deplore by getting the legislature at Albany to deprive the Aldermen and Common Council of their just authority and vest it in mongrel boards or commissions, which have been doing their best ever since to ruin the city. Hence, all that we have to do to get back to our previous Arcadian condition is to abolish all these bad commissions and go back to what would be called a "good old-fashioned, constitutional city government."

Now, so far from this being the fact, the fact is exactly the opposite. It may be said without hesitation that, whatever advances have been made by this city in the direction of good government within the past generation—and they are neither few nor unimportant—have been due primarily to the fact that power and responsibility have been taken away from the mediæval body which formed the city legislature, and vested in boards having at least the feeling of responsibility which comes from long tenure and from being restricted to a certain definite line of duties. The change in New York within that period has been from an overgrown provincial town, with a village government, to a real city, and a real city, we have found to our cost, cannot be governed by a local legislature, because almost all its government consists of functions which are not legislative. To police a city properly, to guard it from fire, riot, and pestilence, to keep its streets and wharves in good order, requires a certain amount of power well defined and lodged in a few responsible hands. A city legislature of two houses does not possess these qualifications, and never will. Hence their powers have had to be gradually taken away from them and bestowed elsewhere, until to-day the Common Council has been wiped out of existence, and what is left of our legislature has not even power to vote the city taxes, but is supervised when engaged in this work by an appointed board.

There is no reason for believing this steady progress in one direction to have been all wrong. It furnishes a remarkable instance, under our very eyes, of the manner in which institutions decay and disappear when they have lost their vitality. It furnishes, also, a curious instance of the manner in which unlimited suffrage, in the long run, defeats its own ends. One difficulty with the Common Council and Aldermen that begun to be felt a generation ago was the character of the men elected to these bodies, and this has, of course, deteriorated with the extension of the suffrage. But to remedy the evil no attack has been made on the suffrage. The people have gone on voting for a local legislature, year in and year out, as before. The reformers, acting on the old maxim, *Populus vult decipi, decipiatur ergo*, have shrewdly permitted the people to vote, but at the same time taken away the powers of those elected by them. In this simple way they have reduced the Aldermen to their present impotence, in which all they seem to be able to do is to obstruct the mayor's nominations, while permitting the people to elect just as many aldermen as ever. Of course this is in effect just as much an interference with the suffrage as if that was directly attacked; but it is easier to go on practising this amiable deception than to face the real question—quietly taking away power from the people's representatives while ostentatiously leaving all power in the hands of the people.

Governor Robinson's proposal, then, is to our mind utterly impracticable, and he seems himself not wholly to believe in his plan; for he recommends also a strong mayor clothed with the veto power. (It is a curious indication of the common feeling underlying all schemes of municipal reform that a strong executive, and not aldermen and councilmen, is what is really needed, that all reformers, however antagonistic on other points, are in favor of increasing the mayor's powers.) He says that the great need of the city is a charter. This is certainly a most remarkable recommendation. A charter is simply a legislative act, clothing the city with certain powers, which the next legislature may change or take away at its

pleasure. There is a charter now, and there has been during all the period of which the Governor complains that it has been one of constantly increasing misgovernment. It is a charter that results in the spectacle of the Albany "Board of Aldermen and Assistant-Aldermen." It is a charter that has produced the twenty-four hundred laws relating to the city; that has made them so confused and conflicting that the Court of Appeals cannot find out what they mean; that imposed a debt of $85,000,000 upon it; that produced Tweed and Sweeny and Hall and Connolly. A charter is nothing but a device for redistributing the offices, and must be so as long as one legislature can change what another has done. What is wanted is a permanent scheme of government which the legislature cannot interfere with. A charter by its very terms implies a scheme that the legislature can do what it pleases with.

There is another plan before the Legislature which the Governor alludes to, but does not discuss—we mean the plan drawn up by Mr. Tilden's municipal commission. This plan involves, he says, certain "extensive amendments to the constitution"; but he omits to point out how, except by extensive amendments to the constitution, any such permanent improvement in the condition of the government of this city as he desires can be brought about. His silence on the subject cannot but be regarded as very unfortunate, inasmuch as it will be taken as a new indication that the reform which the Democrats profess to be anxious to introduce is nothing more than the possession of the offices by themselves. There is the less excuse in this case, as we understand the Governor was waited upon before the meeting of the Legislature by representatives of the committee engaged in pushing the amendments, who urged upon him the advisability of recommending their passage. The general purport of these amendments has been thoroughly explained by the press and at public meetings. They are simply new and fundamental safeguards in the same direction as the reforms which we have endeavored to point out in this article, and constitute the only solid progress made by the city towards a better system of government. They create a strong executive; they leave in existence the local legislature, but they do not increase its powers. They give the power of appointment in all but two cases to the mayor and aldermen, as at present. They take away the debt-creating power of the city. They bring into existence a new board, which takes the place of the Board of Apportionment in supervising the city budget. The election of this board they put into the hands of tax and rent-payers. There is not a single provision of this scheme which is not in the same direction that all reforms introduced during the last twenty years have been. Yet the entire Democratic party have opposed it from the first, and will try this winter to defeat it as a "Republican" measure. Their ostensible cause of opposition is the new Board of Finance. The election of this board by a restricted suffrage is, they say, an outrage. But it never seems to have occurred to them that, as pointed out above, the effects of popular suffrage may be neutralized in two ways: one by leaving the basis of suffrage what it is and cutting down the power of those elected by it to nothing; the other, by restricting the suffrage itself. The former has been going on for twenty years, not only in this city but in every State in the Union. It goes on whenever the power to create debt is cut down; whenever special legislation of any kind is interfered with. Yet nobody calls it an interference with the suffrage. A conspicuous instance of it in this State took place a year or so ago, when, under Governor Tilden's auspices, two constitutional amendments were adopted taking the power over the canals and over the prisons entirely out of the hands of the people. It will, we have no doubt, continue to go on, wherever legislation, whether local or general, becomes corrupt and bad; and whether it is done in this roundabout way or directly by restricting the suffrage, makes little difference. We could not have a better proof of what a fetish the right of suffrage has become than that the Board of Apportionment should exist without offence, though it has usurped the most ancient privilege of the local legislature, while the Board of Finance is denounced as an aristocratic invention. We may add finally that the most amusing thing about the opposition to the amendments is the fact that the section which limits the suffrage was last year separated by the legislature from the others, and may be voted on separately; so that the Democratic reformers are placed in the position of denouncing amendments as unpopular which contain a provision permitting the express rejection by the people of the only clause alleged to be displeasing to them. Meanwhile considerable satisfaction is to be derived from the position of the Governor; for it shows that his study of the question has at least brought him face to face with the fact which every year of the city's recent history proves—that we must either go back to the twelfth century for our form of government or go on as we have been going on, protecting ourselves against the evils which the application of that form to a modern city community necessarily engenders.

A SURVIVAL OF LAND COMMUNITY IN NEW ENGLAND.

IT is only a very few years since the attention of English-speaking people was directed to the fact that all ownership in land was collective in early times, and that remnants of this collective ownership has survived in some countries, and in secluded districts of most countries, down to the present day. We pointed out at the time, in a paragraph (see *Nation*, No. 273) which Sir Henry Maine did us the honor to cite in his 'Village Communities' (p. 201), that the early settlement of New England was made upon the plan of collective ownership, and that remnants of this survived down to the period of the Revolution. We have since been informed by the Hon. J. H. Trumbull of some very curious instances of the same thing in Connecticut even within the present generation, and we propose now to describe a very remarkable system of land community which still exists upon the island of Nantucket.

In the first place, however, it should be noted—as a Western correspondent pointed out at the time of our former paragraph (see *Nation*, No. 275)—that community of property need not by any means have had the same origin in all cases; and, as we ourselves suggested, the Massachusetts community system may have been merely the natural outgrowth of the circumstances, and not even an involuntary copying of the institutions of Old England. An interesting example of a community in cultivation which might possibly have developed into community of ownership, was afforded by the freedmen of the Sea-Islands of South Carolina during the war. The plantations were the unit at the South; and, except in cases of extreme cruelty and misgovernment, the state of society was in a certain sense patriarchal. When, therefore, the masters departed and the slaves were left to themselves, they did not at once scatter: the plantation, with its semi-patriarchal character, still remained the organic unit, even in the absence of the proprietor; the Northern superintendent serving as a bond of union in his stead. The system of cultivation was that of two fields. (In the village communities of Europe the three-field system was the common one.) The two great fields into which each plantation was divided were alternately planted with cotton or corn, and left fallow. The freedmen in a dim way conceived that the plantation belonged to them collectively, and each year a fresh assignment of land was made to each of them, of the field in cultivation. Here there was no fixed proportion or *hyde;* each head of a family took as much land as he chose to cultivate—so many *tasks*, a term quite analogous to *jugerum*, *morgen*, or *ox-gang*. Neither was the cultivation for themselves, but for the proprietor or lessee. But it is easy to conceive that a plantation might have been bid in by its own occupants at a sale of confiscated property (as was done in some cases), and, instead of being divided up, carried on upon this system on their own account. They would have elected their old driver, or some other leader of their own number, as *starosta*, and a system have grown up quite like that prevailing in the Danubian principalities.

To return to Nantucket. This island was originally granted to a company of men, like other New-England towns; only, instead of speedily dividing it up, they developed a most complicated system of community, both of ownership and of cultivation, which still exists in all its integrity, although confined now to a very small number of people, and a very small portion of the island. There are at the present day something less than a dozen persons who possess perfect rights in the common land of the island; but there is only one man living, Mr. Alfred Swain, who understands the system and knows what these rights are.

Nantucket was settled in 1662, by the method usual in New-England towns. A company of twenty-seven proprietors owned all the land of the island, except *Quaise*, a patch of about 130 acres, retained by a former

proprietor. Each proprietor had a right to take up 45 acres as a house-lot, and this was done from time to time, according to convenience or caprice; only a few years ago a claim of 10 acres was made on this account. Until 1717 the company of proprietors were the town; in that year each organization was made distinct, and thenceforward the proprietors, or commoners, were a sort of aristocracy, distinct from the body of towns-people. They have their own records, and continue to have proprietors' meetings, distinct from the town meetings.

In all this Nantucket differs from other old New-England towns only in the late date to which the distinction of commoners was preserved. The development in other respects has been very different. In the other towns they proceeded at once to set off land in full property to the different townsmen—a bit here and a bit there, according as they severally desired meadow, wood-land, bog-land, etc.—until the whole was taken up. In Nantucket, however—as in the village communities of the Old World—the house-lots were the only pieces of land owned by individuals, and other tracts set off for agricultural purposes were still held and cultivated in common. The first tract thus set off was *Shammo* (120 acres), about 1717. The method now adopted appears to have been followed in all subsequent divisions. The 27 shares were measured off and staked off permanently, but without the privilege of fencing off. But subdivisions of shares, which had now become the rule, were not recognized at all, except by the coparceners among themselves, by private agreement. From time to time other districts were set off in the same way, of various extent—*Warehouse Lots*, containing only 64 rods; *Swamps*, 524 acres and 119 rods; and so on—*Fish Lots*, *Beach Lots*, *Squam*, *Southeast Quarter*, etc. In this last division, and perhaps in others, each share consisted of two separate lots, the object being to balance bad land by good. In this division each share (divided and staked off) contains about 90 acres, so that each of the later sub-divisions of *sheep's commons*, to be described presently, contained about one-sixth of an acre in this part of the island—held in undivided severalty with the other proprietors of the share.

Meantime the shares were divided and subdivided, until in 1778 a new arrangement was made. Each of the 27 shares was now divided into 720 "sheep's commons"—19,440 in all. From this time, therefore, the *sheep's common* is the unit of proprietary rights, but it is only an ideal division. The shares, 27 in each district, have been actually surveyed and set off, and are easily known by their numbers; the sheep's commons have never been set off, but the proprietors—be they many or few—of the 720 (or 636) sheep's commons in any share are the proprietors in common of that share. The proprietor of any single sheep's common, therefore, only knows that his proprietary rights are in share No. 12 or 13, and so on, in every district on the island.

The ownership is as complicated as possible. In 1820 there were 322 proprietors, some owning entire shares or even more, and others varying amounts, such as 5, 101$\frac{6}{12}$, 179$\frac{6}{12}$ sheep's commons (a cow's commons, by the way, was reckoned equal to 8 sheep's commons); and the owner of a sheep's common was proprietor of one undivided nineteen thousand four hundred and fortieth part of each one of some twenty divisions—including such as the 64 rods of *Warehouse Lots* and about 2,500 acres of *Southeast Quarter*, besides general proprietary rights over the undivided parts of the island.

In 1813 another complication was added. A number of proprietors desired to have their shares in severalty, and obtained a decree from the Supreme Court to that effect. The district known as *Plainfield* was therefore set off to these parties as the equivalent of their rights in the undivided parts of the island; they still retained their rights in the divided parts, such as Squam, Shammo, and Southeast Quarter. But in the subsequent divisions, made in 1820 and 1821—*Middle Pastures*, *North Pastures*, *Smooth Hummocks*, *Head of Plains*, *Woods and Lower Plains*, *Trot's Hill*, and *Maddequet and Great Neck*—the shares were divided into 636 instead 720 sheep's commons each. In these seven districts, therefore, a sheep's common is $\frac{1}{17}\frac{1}{72}$ of the whole; a full proprietor of a sheep's common at the present day (worth about $2 50 in the market), owns, besides whatever land he may have in severalty, this fraction of these seven districts and $\frac{1}{19}\frac{1}{10}$ of the twenty (or thereabouts) older districts, besides numerous other scattered and ill-defined rights. Most proprietors have, however, divested themselves of some portion of their proprietary rights. Since Plainfield was set off the community has been rapidly dissolving.

The cultivation of these tracts was determined from year to year by vote of the proprietors. In the year 1724-5, 13th day of the eleventh month, the records say:

"Voted and agreed that the propriety will lay out a general field for planting this year. It is voted and agreed that Mattakit shall be the general planting field for ye year insuing.

"Voted that John Barnard, John Coffin, and Jethro Starbuck shall lay out the said Mattekit into shares, and to order where ye fence to inclose ye same shall stand."

It will be seen that this division was merely temporary; Maddequet was not permanently set off until 1821. In 1726 the North Pasture was set off "for the space and term of tenn years"; in 1821 it was laid out permanently. Jan. 24, 1746:

"Voted that Squam land be laid out for mowing for six years, to be mowed but once a year."

Squam was permanently divided in 1778. Jan. 16, 1754:

"Voted that Squam be stocked this year."

The same year two acres to a share were planted with turnips.

In the early part of this century it appears to have become a practice to plant one of the seven great divisions each year, by turn, with corn, and the next year with oats, letting it then remain fallow for five years. After these districts were permanently divided, however, in 1820-1, this system went out of use, and a rage for sheep-raising set in. The land indeed had been ruined for agricultural purposes already, because under the system of community it was no man's interest to manure his land or seed it down, and the ocean winds sweeping over the dry stubble blew all the soil into the sea. Sheep-raising too was a failure, because of a conflict that soon set in between the owners of sheep and the owners of sheep's commons; and for some years these once fertile fields have been bare stretches of scrubby grass.

BEACONSFIELD'S LATEST "SURPRISE."

London, December 25, 1877.

CHRISTMAS is upon us again, and it does not promise to be either a very merry Christmas or a happy New Year. In nearly every department of life, except the legal, which generally prospers when the other departments are in adversity, the prospect is gloomy. Trade is depressed, wages are low; there is great suffering among the poor; many farmers are either insolvent or are compelled to ask for time and for reduction of rent; shopkeepers are complaining of the past and looking doubtfully into the future; no one, in short, is satisfied, except some lawyers and professional men on fixed incomes, who are rather better off relatively to others when money is not plentiful in the country. At present, however, there is no scarcity of money. There is plenty of that commodity lying almost idle, or at very low rates of interest. But people are afraid to lay it out. I do not remember any occasion when there was such a long-protracted want of enterprise in this country. Money, though not actually put away in stockings or hidden in the ground, is for commercial purposes practically hoarded. Men go down to their counting-houses day after day, but they are not nerved up to enterprise. There is an apathy and a distrust which is almost universal just now. There is none of the freshness and vigor of a spring morning about people's purposes. It is all gloom and dulness, like a muggy November afternoon. Now, what is the explanation of this apathy and distrust and purposelessness which is so unusual in British commerce? No doubt there are a great many contributory causes, such as the glutted markets produced by the prosperous times of 1872 and 1873, and the recklessness produced among the citizen and working classes by the high wages of those years. The war contributes, the state of commerce and trade in America contributes, the cruel harvest season we have had, and the almost total failure of the crops—all these agencies contribute. But one of the main causes, in my opinion, is the existence of Lord Beaconsfield and his insane passion for "surprises." Ever since he came into office we have been in a perpetual state of tension and uncertainty. We never know from one week's end to another what he would be at. He is always doing something startling or threatening something mischievous—not openly and in a manly English way, but in a crooked and enigmatic way. For two years of his administration, when Europe was at peace, and when we in this country were recovering from the excessive zeal of Mr. Gladstone's home policy, we were only amused by Mr. Disraeli's extravaganzas. They were, comparatively with his later exploits, harmless, and they did not especially commit us to anything risky. We were rich then, and fat, and well liking, and inclined to be genial all round. He amused rather than alarmed us. But since the complications in the East have assumed a serious aspect, and Lord Beaconsfield permits his erratic genius to wander over the dangerous places of Oriental diplomacy, we feel that we are

getting out of the department of farce and entering on that of melodrama or even tragedy. He takes every opportunity of unsettling all our calculations. Whenever any of his colleagues announce to the world that our intentions are honorable and peaceful, and we begin to breathe and settle down to our usual work with thankfulness that Lord Beaconsfield is not omnipotent in his Cabinet, he does something eccentric to show us that our thankfulness is premature.

The last card he has been playing is a very risky one, but he has played it with his usual sang-froid. It is his undoubted influence with the Queen. At a most critical time in the Eastern imbroglio a new volume of the 'Life of the Prince Consort' is published, if not by authority, certainly with the sanction, of the Queen. The Prime Minister was undoubtedly aware that this book was on the point of being published, and it is not unreasonable to suppose that he was consulted as to the propriety of giving some of the more private opinions and letters of the Prince and of the Queen to the public. Now, this volume treats almost exclusively of the period of the Crimean war. These opinions were formed and these letters were written at a time when we were at war with Russia, when all the worst passions in human nature were aroused against her, when every act of Russia was construed with the determination to see her in the worst light, when people's judgment was not, strictly speaking, upon the balance, and when to those motives for jealousy and hatred of Russia there was superadded a feeling of alarm at the critical state in which our small army was left in the Crimea, and our not unfounded distrust in the stability of the French alliance. It would have been impossible to have formed any but an unjust estimate of Russia and her designs at that time, or at least a very unfriendly estimate. I am no admirer either of Russia or of her policy, and I have not hesitated to express my views upon both in the letters which I have sent you from time to time. But I cannot but consider it indiscreet to select this particular moment, when the relations between this country and Russia are notoriously strained, for the publication of a series of letters and memoranda from the most important people in this country such as this volume contains. It is unfortunate that a book which really is almost a manifesto against a nation with whom we are at peace, but with whom our relations are in a state of tension, should be published avowedly with the Queen's sanction and probably with the approval of the Prime Minister. Following upon that publication comes a series of *communiqués* to the press regarding frequent visits paid by Lord Beaconsfield to Windsor, and then a sudden announcement that the Queen was going to take the unusual, the almost unprecedented, course of paying a visit to her Prime Minister at his country seat. The Queen has only paid four visits to her Prime Ministers since she came to the throne in 1837, and none of them, if I am rightly informed, were made either in the dead of winter or when critical events were impending. And people are still wondering at the meaning of this unusual proceeding on the part of the Queen, and shaking their heads doubtfully over it, when a more startling announcement is made with equal unexpectedness, and that is, that after two or three Cabinet councils following with unusual rapidity one after the other, Parliament has been suddenly summoned to meet for the transaction of business on the 17th of January, or three weeks before the usual time. We cannot but ask what all this means.

There may be nothing whatever in the Queen's civility towards Lord Beaconsfield beyond her desire to gratify an old servant of the Crown in the way which she must know pleases him best, namely, by appealing to his vanity and his sense of the histrionic. This would be in keeping with her habitual demeanor since she came to the throne, because, though both she and her late husband have often been unjustly accused of intermeddling in party politics, these accusations have always been disproved, and her kindness and tact in dispensing her marks of good will towards her ministers have ever been remarkable, and no mark of good will could be so pleasing to Lord Beaconsfield as such an attention as she showed him last week. But be this as it may, the time was inopportune. It is known far and wide that the foreign policy of the Prime Minister is hostile, or would be if it had full play, to Russia, and it is believed that if he had his will we should be at war with Russia all along the line from the Himalayas to the Baltic. It is known that there is a war party and a peace party in the Cabinet, and that they are very nearly balanced. It surely was injudicious in the Queen, and culpable in Lord Beaconsfield if he advised her, to give even the semblance of approval or preference to one policy over the other. However, it has been given by these recent transactions, and the effect has been very serious in the country. In London there has been a war-scare since the announcement that Parliament is to meet so soon, in commercial circles a new element of uncertainty has been thrown like a bombshell upon a quiet household that had already been heavily bombarded, and throughout the country an unhealthy excitement has been produced which prevents people from settling down contentedly to their regular work. All this coming on the top of serious commercial depression has had a bad effect in all circles. It would be a curious financial calculation to discover how many millions sterling must be written off against Mr. Disraeli's insatiable propensity for "surprises." What has the gratification of his vanity cost the commerce of Great Britain during the latter years of his active life? What this new exhibition of political fireworks means none of us, of course, can understand. There are a thousand and one rumors and surmises. I have tried to sift the more likely of them, and the conclusion I have come to respecting the early meeting of Parliament is this: that the Cabinet are at sixes and sevens, and that they have, by way of a compromise between a declaration of war and absolute neutrality, determined to ask Parliament for a large sum of money in order to put this country in a state of preparation for war if Russia should make any extravagant demands (which is unlikely), or if she should wish to conclude a treaty with Turkey which might seriously affect our interests without consulting us; and if the House of Commons should refuse to grant the necessary supplies, the Government is prepared to appeal to the country on the issue, not of peace or war, but of the refusal of the House to grant supplies for preparation. If this is all that is meant, I can only say that there has been a great deal of unnecessary mystery about the whole business. The House will probably grant the supplies, but the policy of the Government will be subjected to sharp criticism, and a strict vigilance will be exercised upon the expenditure of every farthing of the sum of money granted.

Correspondence.

THE RECENT AWAKENING OF CAPITALISTS AND THE *NATION'S* PREDICTION IN 1874.

To the Editor of The Nation:

Sir: On the 17th December, 1874, the *Nation* closed a series of articles on the dangers of inflation with the following prediction:

"*If, through the inaction of the business world, inflation should be forced upon this country in* 1878, *which is the earliest time at which it can be put in motion*, three results would probably follow. [Among them . . .] the business community would be aroused into doing what can be done much more easily now. *The only credits would be gold credits, the only loans gold loans, the only bank discounts those of gold notes.*"

Turning back to the articles, I find that on the 6th of August the *Nation*, reviewing the causes which had made Western inflationists, used the following language:

"The West, which is always a borrower, was not slow to perceive that loans could be readily procured to carry on its speculative enterprises. It was also clearly enough perceived that fresh dilutions would make it all the easier to repay the nominal amount borrowed. So far as the hand-to-hand transactions of daily life were involved, the fluctuations of paper were comparatively unimportant; but when it came to 'time transactions,' where the rise or fall of paper might exceed all reasonable calculation, business probity required that the real value of the thing loaned should be definitely settled and mutually understood. Instead of this, the lender, as a rule, speculated upon the chances of paper approximating to gold before the debt should mature, and the borrower speculated upon the chances, first, that he would make a great deal of money out of his venture, and, second, that if he did not, inflation would come along and tide him over the bar of payment. He was thus educated to be an inflationist, and a hundred other men looking on at the same time were taught the same lesson."

Having thus shown how the business community by dealing in paper-money for "time transactions" was responsible for the West, and indeed for all borrowers, being inflationists, the *Nation* proceeded to show the complete remedy which the business community held in its own hands, and to demonstrate that financial safety required that this remedy should be put immediately into operation (*Nation*, 13th August, 1874):

"The inflationists do not seem to understand that the Supreme Court has expressly decided that we have in this country two kinds of 'lawful money,' and that the American people are free to deal in whichever they please. Further than this, the Supreme Court has given a valuable practical effect to its decision by holding that where the contract is made payable in one of these kinds of money—that is to say, in gold—the judgment in a suit upon such a contract must be rendered for gold, and the sheriff must satisfy the execution by paying the judgment creditor the full amount in gold. For such contracts there is, in contemplation of law, no paper money in existence. There is, therefore, in every man's hands a final remedy against inflation. All that is necessary to make this remedy effective is to make it operative. If any person can doubt this, he has

only to glance at the Pacific communities, where the resolute will of the people has kept paper out of circulation as completely as though it were forbidden by the Constitution of the United States. There are no inflationists there; for every man, no matter how much he may want money made easy, knows that a nominal dollar cannot be legislated into a real dollar, and that a real dollar cannot be liquidated by a nominal dollar, and that if he borrows the latter it will be worth no more to him than he can sell it for at a broker's. . . . The error of capitalists, and indeed of the entire business community, has been that they were willing to speculate upon the supposed progress of contraction, and have so managed financial matters that every 'time transaction' has been a bribe to the debtor to be for the time an inflationist. If New York, Philadelphia, and Boston were to agree that all loans and credits henceforth are to be in gold and for gold, a borrowing community like Indiana would speedily change front and be heard declaring that irredeemable government notes are little better than their former 'wild-cat' currency, and that the interests of the West demand that paper must be put up to gold."

And again on the 17th December, 1874, the *Nation* said:

"Whenever this right [the right of the business community to deal in *coin*] is decisively exercised—not in the daily hand-to-hand affairs of life, where it would be found inconvenient and ineffective, and where the law that the poorer money will drive out the better holds true, but in all 'time transactions,' whenever a loan is made or a credit given—then the premium will be shifted from inflation to resumption, and the game which our demagogues now find it easy to play will become a losing one. So long as men accumulate money by work and thrift, and lend it to men who, when they borrow it, expect with the aid of Congress to return but half of it, just so long we are helping and in fact bargaining to perpetuate, the present evils. So long, too, as the business world goes on ignoring the coin in which it may if it pleases exclusively trade, just so long it is teaching the less informed portion of the people that gold and silver need not exist. . . . Is it not time for our Chambers of Commerce and Boards of Trade to begin to assert that the accumulating industry of the country has in fact the power to force resumption, just as the people of California forced a gold circulation?"

These admonitions of the *Nation* were commented on by other papers and talked over in business circles, and the facts and the remedy were as well understood in New York, Philadelphia, and Boston on the 1st January, 1875, as on the 1st January, 1878. What did the business men of these cities do? Just what might have been expected. They allowed their ship to drift as it had been drifting; they continued to speculate "upon the chances of paper approximating to gold," and they embarked in new enterprises for lending Western borrowers all the paper money they wanted on mortgage securities, whereby it is safe to say there are now more individual debtors on "time transactions" in the West than ever before. Having thus steadily sown the wind for three years, they now see something which looks like a whirlwind coming down upon them in 1878, "which is the earliest time at which it could be put in motion"; and they also see that under their constant teaching the South and West are not only more strongly inflationist than ever before, but are strong enough to carry silver inflation over the President's veto, certainly in one House and possibly in both. Amid these (long-foretold) circumstances the business community awaken to the fact that business "probity" requires that business shall be done on a gold basis, and make an appeal to the country against the impending silver inflation upon moral grounds which they have been themselves constantly disregarding.

Respectfully, etc., etc., C. C. N.

Washington, January 3, 1878.

FORESEEING THE DECLINE OF SILVER.

To the Editor of The Nation:

Sir: In Mr. Halstead's letter on the demonetization of silver, published in your last number, there is a curious evasion of one of the points made by you in your article "Why the Demonetization of Silver did not Attract Popular Attention." Mr. Halstead quotes from your article these words:

"But, then, it is said that the Demonetization Act was a speculative measure. The men who 'engineered' it *knew* silver was going to fall, and therefore determined to get it out of the way as a legal tender for the benefit of the bondholders who desired payment in gold. How could they know?"

I understand from this passage, as well as from the numerous articles published in the Cincinnati *Commercial* and other journals which advocate the Bland Bill, that the men who "engineered" the Coinage Act are accused of having foreseen the fall in the value of silver, and having therefore brought about its demonetization in order to save the holders of Government securities as well as other creditors, both public and private, from the necessity of accepting the prospectively cheaper metal in payment of their claims. But Mr. Halstead proceeds to answer your question as to how they could have known that silver was going to fall by saying that the "money-changers" and "experts" knew it because they knew that the demonetized metal would depreciate from the very fact of its demonetization: in other words, they knew silver was going to fall because they intended to make it fall. This is a change of base. The silver-men have been telling us that the "money-changers" demonetized silver because they foresaw its fall. You ask how could they have foreseen it? Now Mr. Halstead slips away from under your query and triumphantly answers from his new-found position: "They foresaw its fall because they demonetized it."

You have well shown in your comments on Mr. Halstead's letter that as the causes which operated to produce the decline in the value of silver did not begin to work until two years after the Coinage Act of 1873, the decline could not have been foreseen, and, in fact, no one has undertaken to show how or why it could have been foreseen. But there is another answer to Mr. Halstead's argument. If the "money-changers" or "experts," whom he accuses of having brought about the demonetization of silver, did so because they desired to appreciate one metal at the expense of the other, why did they not demonetize gold and thus appreciate still more that metal which was already the more valuable? In 1873 the silver dollar was worth three cents more than the gold dollar; silver was therefore much the more favorable metal for the "money-changers" to retain, because part of the desired appreciation already existed in that metal. Probably the answer will be made that the "money-changers" and "experts," in their omniscience, foresaw the increased yield in the American mines; and yet, whenever the accusation is made that the silver movement was initiated by men who are interested in working off this increased product of silver, we are told that those same mines yield as much or more gold than silver. Are not the champions of the "dollar of the fathers" very like the Dutchman's flea?

In conclusion let me say that, although it is unfortunately true that the majority of the Western people have been led astray by such blind guides as the Cincinnati *Commercial* and Chicago *Tribune*, there are nevertheless a good many of us who regret and deplore this movement, which, if successful, will deprive us not only of a single gold standard but even of a double metallic standard, and commit us to a single standard of silver or a double standard of silver and paper, and must work infinite mischief to the finances and business of the country. J. D. B.

Cincinnati, December 31, 1877.

THE CUSTOM-HOUSE IN THE BOSTON ELECTION.

To the Editor of The Nation:

Sir: I observe that in a paragraph of your issue of yesterday concerning the late election here you "regret to see that in order to secure this result [the election of Pierce] they [the Republicans and Independents] were forced to call in the aid of a machine on their own side—*i.e.*, the Custom-house." I think the Citizens' Committee, representing the convention which nominated Mr. Pierce, would, in common with the great body of our citizens, be glad to know your authority for this statement.

From a somewhat intimate acquaintance with the management of the campaign, I think myself authorized to deny that either Mr. Pierce or the Citizens' Committee asked for aid from the Custom-house. If Mr. Simmons or any person in the employ of the United States Government exerted themselves in behalf of the election of Mr. Pierce, they did it without solicitation from any one who had a right to speak for the Citizens' Committee or its candidate. W. E. Perkins.

Boston, December 22, 1877.

[The sentence quoted by our correspondent was immediately followed by this one: "*If we may believe the Democratic papers*, the civil-service order was found not to interfere with a great deal of 'legitimate political activity' on the part of the 'boys,' who 'peddled Republican tickets' at a great rate." The two stood and were intended to stand in strict connection.—Ed. Nation.]

Notes.

The Riverside Edition of the British Poets (Hurd & Houghton) now includes Shelley's Works in two volumes, or about twelve hundred pages, reduced in price like the rest of the series.——The discovery of a hitherto unknown romance, "The Journal of Julius Rodman," by Edgar A. Poe, has been reported in the English literary weeklies; whereas the

writing in question is not a romance, and appeared thirty-five years ago in Burton's *Gentleman's Magazine*. It is a bald résumé of the various explorations of the Rocky Mountains up to the year 1842, and introduces a few characters of a proposed romance which was never carried further. ——A novelty in New England pedigrees is announced to be published by David Clapp & Son, Boston, viz., 'An Indian Genealogy, including seven generations in descent from the chieftain Massasoit,' composed by Gen. Ebenezer W. Peirce from the lips of Mrs. Zerviah Gould Mitchell, of North Abington, Mass., who is of the seventh generation aforesaid.——The Alumni Association of Haverford College, Penn., offer a prize of $250 (or £50) for the best essay on "The most practicable plan for promoting the speedy substitution of judicial for violent methods of settling international disputes." Essays must be submitted during the present year.——In addition to what we have already remarked about Bulletin No. 6 of the Harvard College Library, we may notice its detailed statement of book funds, from which it appears that the library had, when the Bulletin was published, $11,775 to spend annually for books, with a surplus of $3,000 for contingencies. This has been since increased by the Sever bequest of $20,000. The library proposes to publish a catalogue of scientific serials, prepared by Mr. Samuel H. Scudder, which will include society transactions and independent journals in every branch of natural, physical, and mathematical science, excluding only the applied sciences, medicine, agriculture, technology, etc. It will extend to about 300 pages, and be delivered bound for $4. Some numbers printed only on one side of the leaf for catalogue purposes will be sold in sheets for $5. The list will be double in extent any at present existing.——A new publishers' advertising sheet, D. Lothrop & Co.'s, Boston, has something interesting and pleasant. Besides a classed list of the more important publications in the United States from September to December 1, arranged on the Dewey or Amherst plan, it prints notices of books by well-known writers. The *Book Bulletin* is issued quarterly for a small subscription price.——Baron Mueller, at the request of the Victorian Government, has prepared (primarily for the use of schools) an introductory work on the botany of Australia, "in which he groups together in their respective families the most remarkable species for consideration, and also gives much useful information respecting their industrial and medicinal properties." Tree-cultivators everywhere might find this work suggestive.——A new edition has just been published in Paris of Robert-Houdin's 'Comment on devient Sorcier,' which has been out of print for eight years. This is the work which Mr. Hoffmann has recently translated.——Mr. Lewes's essays on 'Actors and Acting' is now accessible to American readers in the handy Tauchnitz edition.

—By rare good fortune a few copies of a privately printed volume of great interest and value have been placed on sale—with Henry Holt & Co., in this city, with Little, Brown & Co., in Boston, and with Charles W. Sever, in Cambridge. We refer to 'Letters of Chauncey Wright, with some Account of his Life,' by James Bradley Thayer (Cambridge, 1878). In noticing the collection of Wright's 'Philosophical Discussions,' edited last year by Professor Norton (New York: Henry Holt & Co.), we remarked that it "contains, we suppose, the only remains of its remarkable author which will ever be given to the public." In this we were, happily, mistaken, and the monument is now completed by an act of friendship which, while still leaving Chauncey Wright to speak for himself, permits him to be known and esteemed as his public writings were quite incapable of making him. We advise all who own the weightier and formal volume to add to it this familiar view of the man, his daily occupation, the delightful circle in which he lived, the acute minds with which he conversed. The editing has been done with admirable discrimination and skill, and the book (from the press of John Wilson & Son) has a transatlantic beauty and solidity.

—We have received another letter from Mr. Ward Nichols about the awards in the Art Group at the Exposition, and forwarded it to General Walker, who has written a rejoinder. As both communications consist mainly of naked contradictions, and as we have no machinery for trying issues of fact, we think these gentlemen will excuse our declining to print them, or any thing more on the same subject. We are quite sure the controversy in its present stage would have no interest for the public.

—A correspondent writes us from Indiana:

"A recent issue of the *Nation* commented on the amount of money loaned by insurance companies and other Eastern institutions on landed security at the West, and spoke of it as a thing likely to do good there. To an observer on the ground the most immediate and noticeable effect is to carry each and every person so effecting a loan over to the side of repudiation, whether to be accomplished in whole or in part by silver or by greenbacks.

"The rate of interest charged cannot be made by farming. The loan, therefore, is a lasso swung for the land. The wisdom of the venture should take into consideration the poverty of the community, indicated by the extent of the aggregate loan, the high rate of taxation which has taken all mobility out of land, the effect on the market of so large an amount of land subject to sale; and last, not least, the capacity of a Western man to damage a farm from ownership of which he has been evicted—the landlord being a non-resident. If waste should ever be made a science, the facts for its treatment can be collected at the West.

"As shrewd a thing as Eastern investors could do would be to convert their 10 per cent. currency loans into 5 per cent. gold loans payable at the usual five-year term. That would take the borrower over to the hard-money camp. It is in vain to tell a Western farmer that he is, and always has been, at specie payments, and must so continue while the country's surplus is sold in a gold market. He handles greenbacks, thinks it a question of proportion, and don't or won't understand that he pays the insurance on a redundant and fluctuating currency. But he perfectly understands that a contract made in a standard of high value and liquidated in one of low value puts money in his pocket, and the reverse process in that of the loaner. Not a little of the hostility felt by the borrowing class to the East grows out of the belief that the latter game is being played with them, that they are to be the losers; and then they chuckle to think that votes will turn the tables."

—We find in the Boston *Daily Advertiser* an announcement of a projected attempt at special legislation which for impudence cannot be surpassed even by the Texas-and-Pacific job. That purely personal enterprise known as the Woodruff Expedition having utterly failed to persuade the public that any good to science could accrue from its mob of tourists committed to a preposterous programme, and having obtained neither ship, passengers, nor scientific staff, now seeks to use the Government in order to buy a ship more cheaply, to secure a scientific staff without cost to Woodruff and his associates, and to give the speculation the air of a national undertaking, under cover of which it is hoped the scheme will not miscarry a second time. According to the *Advertiser* (which, with characteristic lack of humor, thinks the only obstacle hitherto has been the "difficulties in procuring a suitable ship"), the "managers and friends" of the expedition got Senator McDonald, before the recess, to introduce a bill authorizing them for the purposes of the expedition exclusively to register an English or German ship, and sail her under the American flag, and "detailing officers of the army and navy, not more than five of each, for duty with the expedition, who are to be required to send detailed reports to their respective departments, and make collections, scientific and other, for the National Museum." This bill was referred to the Committee on Commerce, and is to be brought up for early action. It merits the same kind and amount of consideration as would a bill authorizing Barnum to import an Egyptian obelisk free of duty, and detailing army and navy officers to attend to its transportation, and write reports on its hieroglyphics, and make dredgings from the caisson *en route* across the Atlantic, and take the tickets at the Hippodrome after the stone had been set up for exhibition.

—M. Octave Feuillet is a playwright who never offends the taste, but whose plays are so quiet, not to say tame, as to require exceptionally good acting to prevent their becoming tedious. In the "Man of Success," now on the stage at the Union Square Theatre, there are no less than six acts, and yet no great amount of action. The plot turns on the development of a type of character favorite with dramatists and novelists of a certain class—the hard-hearted, unprincipled man of the world, who succeeds in everything he undertakes, but whose means of success will not bear examination. Sometimes he has a redeeming trait, sometimes not. In the present play he is very much attached to his children, though, as he seems to have no other human affection, this paternal tenderness does not seem the most natural thing in the world. He has been, as a matter of fact, a great rascal, having obtained his wealth by a fraud deliberately practised upon his partner in business, who had shot himself under the false impression produced by the misrepresentations of Raoul that he was a beggar. The son of the suicide, however, George Sorel, the "man of success" brings up and treats with great kindness, looking forward to a marriage between his daughter and the young man. Everything begins now to go wrong, chiefly, it must be confessed, because the misguided man of success determines to "enter the political arena." His enemies get hold of the real history of his partnership affairs and raise the "cry of fraud." Troubles with his wife also begin; his children discover his true character; he fights a duel with and wounds young Sorel, between whom and his daughter there is no longer any concealment as to the state of their affections; his friends desert him, and he is hurried out of his own house lest his daughter, reviving from a fainting fit, shall see in her father the murderer of her lover. It is hardly necessary perhaps for those who know the peculiar tenderness of M.

Feuillet's disposition to describe the end of the play. The lover is not killed at all, the father is converted at the last, and a happy reconciliation and marriage crown the whole. It is all highly improbable, highly romantic, undeniably "genteel," and a little dull. The French moral intended to be conveyed is the redeeming influence of parental affection; to an American audience that most likely to be drawn would be the danger of successfully sustained "charges" brought against a candidate during an excited campaign. Mr. Coghlan's acting is good, though to our mind a little too stiff. Mr. Polk, as the Peruvian adventurer, is so perfect that it is a pity more was not made of the part by the author. The play, of course, suffers in the hands of English-speaking actors, and in French must be very much better. It will hardly prove as successful, however, in the long run as "The Romance of a Poor Young Man."

—The *North American* for January-February contains, among its principal articles, a eulogy on Charles Sumner by Senator Hoar; the first instalment of a series of papers on Dramatic Composition, by Dion Boucicault; a chapter from Lecky's forthcoming work, a 'History of England in the Eighteenth Century,' on the English aristocracy; and a paper on the origin of the Italian language, by W. W. Story. It is needless to say that Mr. Hoar's opinion of Mr. Sumner is a high one—so high that he does not shrink from lauding his subject's ability as a "jurist." He says that Mr. Sumner was "a zealous student of that branch, or rather, we should say, of that main trunk of the science of jurisprudence which is somewhat inexactly called by some writers the 'Law of Nature,'" and adds that if he had gone to Cambridge in 1845, and succeeded his friend and teacher, Story, "he would have completed the task which Mackintosh left unfinished." Mr. Hoar defines the "Law of Nature" as follows:

"This science, first declaring the great fundamental principles of morality, which are applicable to the whole private and public conduct of men, then determines the limitation of the authority of the state, speaking through its legislature or judicial tribunals, in compelling that application; then deduces from these principles the rules which should govern men in their transactions and controversies with each other, whether these transactions and controversies arise between independent nations or between private citizens. Its pursuit requires the study of the great writers on ethics, on the law of nations, maritime and commercial law."

This is a tolerably wide field, and a dangerous one, as may be seen (if not otherwise) from the difficulty Mr. Hoar discovers in defining it. But we cannot believe that there is much reason for supposing that Mr. Sumner as a teacher of this or any other kind of law would ever have made a success. His notions as to the functions of what he was fond of calling a "jurist" indicate this pretty clearly. Mr. Hoar quotes from his eulogy on Story a contrast between the lawyer and judge on the one hand and the "jurist" on the other. "All ages," he says, "have abounded in lawyers and judges. There is no churchyard that does not contain their forgotten dust. But the jurist is rare. . . . The jurist is higher than the lawyer, as . . . Washington is more exalted than the Swiss, who, indifferent to cause, barters for money the vigor of his arm and the sharpness of his spear." This is not quoted with approval, but we are surprised that any friend of Mr. Sumner's reputation should reproduce it at all; for it proves an absolute failure on his part to comprehend the subject with which he was dealing. The "jurist"—this ideal character, who is not a lawyer or a judge, and who knows law not as it is found in the records of decided cases, or in constitutions or statutes, but as it may be supposed to exist in its pure essence—is a creation of the mind, who never has existed and fortunately never will exist. We say fortunately, because we can imagine nothing more detrimental to the best interests of society, to the safety of property, reputation, and life, than the spread of the idea that we can learn what law or justice is by going to professors of the "Law of Nature" instead of to the judges and advocates in whose hands in every generation is the administration of the only actual systems of rights and duties which we know anything about.—Mr. John Fiske contributes an article called "A Crumb for the 'Modern Symposium,'" which may be read with profit by those who are frightened at the ravages "materialism" is supposed to be making in modern philosophy. He declares that in his opinion this philosophy, "as represented by Spencer and Huxley, not only affords no support to materialism, but condemns it utterly, and drives it off the field altogether."

—Necrologically speaking, 1877 has been generally treated by the press as an "off-year," and doubtless the sudden quenching of splendid names has been more striking and impressive in former years. Among rulers, the Queen of Netherlands was the only one of note who died in the midst of her reign, unless we except Brigham Young and his *imperium in imperio*. Thiers seemed to lose a possible return to power together with his life, but we can now rejoice that the opportunity did not come, and perceive how well able France was to spare him, even in the gravest of crises. The death of Rosas, the Gaucho dictator of Buenos Ayres, in exile in England, was as great a surprise as that of the forgotten Abbé Sieyès to his contemporaries (or, as we might more fitly say, his posterity). The list of departed statesmen is certainly not brilliant, nor was he the greatest whose death was really of the most political importance, Indiana's Favorite Son, Senator Morton. The better part of French politics could sincerely regret the loss of MM. Ernest Picard and Alexandre Glais-Bizoin; the worser part could hardly mourn M. Drouyn de Lhuys. Agitators like Dr. Johann Jacoby and George Odger will be variously classed, but they at least helped to raise questions which statesmen had to settle. No soldier of undying renown passed away, though the list includes a veteran of many generations, Field-Marshal Von Wrangel, and Generals Von Steinmetz, Changarnier, and D'Aurelle de Paladines; in this country, the Confederate General Forrest, of unsavory memory. Rear-Admiral Sir Edward Belcher, of the naval dead, is sure of being long remembered, by Arctic preservation, as we may say. Rear-Admiral Wilkes left his mark "under the frozen serpent of the South," and had peculiar claims to a pretty far-reaching notoriety in connection with the history of the rebellion. His associates, Rear-Admirals Alden, Bailey, Davis, and Goldsborough, had each a lustre of their own, but must sooner be forgotten. Admiral Semmes, on the other hand, may vie with Wilkes in remembrance.

—Two journalists of the first rank, François Buloz and Walter Bagehot, the one mainly an editor, the other mainly a writer, adorn the necrology of 1877. Nor is the roll of authors insignificant, especially if we name Thiers again in this class. By a curious coincidence the Frenchman who did most to foster the Imperial legend died in the same year with the Frenchman who did most to uproot it—Pierre Lanfrey, the lamented historian of Napoleon I. Spain lost Fernan Caballero, whose skill as a novelist was equalled by her mediæval obscurantism; Denmark, the poet Winther; Sweden, her greatest living poet, Johan Ludvig Runeberg; Germany, the Anglo-Saxon scholar, Grein; Russia, the erudite Joseph Bodianski, the ardent Slav antiquarian, and Anthony Mukhlinski, the eminent Orientalist. Among English-speaking writers, the fame of our own Motley will be most enduring; but neither Edmund Quincy nor Lorenzo Sabine will be quickly forgotten, being also historians, each of his own kind. Unique, too, was John S. C. Abbott. An interesting period in our Revolutionary history—the intervention of France—had been only partially treated by Thomas Balch when his labors were brought to a sudden close. In England, Julia Kavanagh, the late-lingering Lady Stirling Maxwell (Mrs. Norton), and Samuel Warren will not be missed from the ranks of active literary producers. Metaphysical writers of distinction were Alexander Bain, Tayler Lewis, and Henry B. Smith. Authors, too, were Ambroise-Firmin Didot and William Longman, and these, with Fletcher Harper, represent well the great publishing interests of their respective countries.

—In science, Le Verrier's name leads all the rest; but Philip Carpenter and John G. Anthony, conchologists, and F. B. Meek, palæontologist, wanted neither ardor nor ability in their several fields, and with them, if of a somewhat lower rank, James Orton should be mentioned and remembered. Art has lost Gustave Courbet, the painter, who led in the destruction of the Vendôme column, and Margaret Foley, a meritorious Boston sculptor and cameo-cutter. The stage loses, of playwrights, Philip Edward Devrient, the Viennese Mosenthal, and Théodore Barrière; of actors, Matilda Heron, E. L. Davenport, and Edwin Adams; of singers, Titiens; of critics, John Oxenford. A great inventor, Fox Talbot, for ever to be associated with the discovery of photography, also takes a high rank among scientists and scholars; Ross Winans and R. P. Parrott, inventor of the gun which bears his name, were America's losses in this class. Americans, too, were those geniuses of enterprise, Henry Meiggs and Cornelius Vanderbilt; while James Brown and Moses H. Grinnell won a more legitimate distinction in commerce and exchange. Two philanthropists, Robert Dale Owen and Mary Carpenter; and one prelate, Cardinal Sforza, conclude our list without completing it.

—'Zur Deutsch-Skandinavischen Geschichte des XV. Jahrhunderts,' by Freiherr von der Ropp, is a sketch, in 114 pages, of the process by which Queen Margaret's Union of Calmar (1397) was broken up under her incapable colleague and successor, Eric of Pomerania, and the three Scandinavian kingdoms restored to their former isolated independence. It

begins with the controversy with the Duke of Holstein in regard to the fief of Schleswig, after Margaret's death in 1412, and ends with the succession of Christopher of Bavaria to the three crowns in 1442—no longer as a federal union of the kingdoms, but as a mere personal union, which had no effect beyond the lifetime of the prince himself. Indeed, the fatal defect of the Union of Calmar was in providing an effective method by which the union of the crowns, complete in theory, could be secured in practice. It was an interesting attempt at a genuine federal union, which we hope to see adequately handled by Mr. Freeman whenever he takes up again his 'History of Federal Government.' The pamphlet before us closes (p. 112) with some valuable observations upon the relation of the crowns, and their authority under King Christopher III. The royal office had been forced to unite with the nobility to crush the liberties of the third estate, and at the same time to surrender its own prerogatives. In the next century the mischief was partially remedied in Denmark by its conversion into an absolute monarchy, as the only practicable counterpoise to the nobility and protection for the lower orders. It was Eric's pitiful reign that destroyed at once the liberties of his kingdom and the hopes of a great united northern empire. About 75 pages of documents follow the essay.

HEBREW MYTHOLOGY.—II.*

THE process adopted by Professor Goldziher for resolving Hebrew legends into nature-myths is comparatively easy to a competent Semitic student, and there is no apparent reason why a single Scriptural character should be allowed to retain his personal individuality, unless it is that the scientific mythologist "resists the temptation" of transforming him in order to give added weight to the discoveries announced with respect to the rest; for the "scientific" methods adopted could be made to prove the solar symbolism of Arphaxad as readily as that of any other personage identified by the author—as readily, indeed, as the Rabbis of old proved that the names of every object in the universe were to be found in the death-song of Moses (Deut. xxxii.), or as "pickled cucumber" has been shown to be derived from "King Jeremiah," through the easy stages of "Jeremiah King," "Jerry King," "Jerking," and "Gherkin."

First, with great show of exactness, certain psychological postulates are laid down, to prove how the mind of the untutored savage works in observing natural phenomena, in transmuting these into myths, and in handing them down to posterity, and how posterity, gradually advancing in civilization, remoulds and develops them. Then it is assumed that certain ideas and epithets are invariably attached to certain objects and processes of nature, and whenever these ideas or epithets can be recognized in a proper name, or injected into it by any torturing of radical, prefix or suffix, the mythologist turns triumphantly around and assures us in the most positive manner that science has demonstrated the wearer of the name to be the sun or the moon, the night or the day, the cloud or the dawn, as the case may be. If the result is too ludicrously incongruous, the author repudiates all responsibility. "Whoever," he says, "finds contradictions in all this must not turn against the interpreter and reconstructor of the myth, but against the mind of man itself which created myths; his dispute lies with the latter, not with the methods of mythological science" (p. 174).

The vice of these scientific methods is fairly illustrated by Prof. Goldziher's laborious investigation of the altered relations which man bears to nature when he passes from the nomadic to the agricultural stage of existence. To an ordinary reasoner it would appear that this would be a matter of climate; that the estimation of the cloud or the sun as respectively beneficent or maleficent would depend upon the prevalence of drought or rain, heat or cold, and that an inhabitant of Scandinavia would look upon these natural objects with very different feelings and construct upon them myths very different from those suggesting themselves to the inhabitant of the Libyan desert. The scientific mythologist, however, deals with general principles, and to obtain them expands particulars into generals without the slightest hesitation. Prof. Goldziher's theory, for instance, requires that the Hebrew myths should have been formed in the rudest nomadic stage; that during that period the night, the moon, and the cloudy sky should be regarded as beneficial, and that when the nomads settled to agricultural life the sun should in turn become the source of life and prosperity. To prove this as a general principle he devotes a long and elaborate disquisition (pp. 58–89) and he frequently refers to it subsequently as an established fact, regardless of the self-evident proposition that while the nomads of the Arabian desert may prefer to travel by night, as he superabundantly proves, those of the steppes of Tartary may naturally prefer the day; and that although in England the husbandman may regard the sun as a perpetual benefactor, in Palestine his great enemy was drought, and his most longed-for blessing was cloud and rain. The Deuteronomist wrote when the agricultural stage had been long established, yet he represents Yahveh as promising as a reward for obedience, "I will give you the rain of your land in his due season, the first rain and the latter rain," and as likening the droppings of the clouds to his own teachings: "My doctrine shall drop as the rain, my speech shall distil as the dew; as the small rain upon the tender herb, and as the showers upon the grass" (Deut. xi. 14; xxxii. 2). Nowhere, we believe, throughout Scripture, after the Deluge, is the rain spoken of as hurtful, except an allusion in Proverbs (xxviii. 3) to a "sweeping rain," and a "great rain" which frightened the people in the time of Ezra (Ez. x. 9), while throughout the Talmudical writings few subjects are more frequently alluded to than rain as the object of supplication to God. Of course, therefore, all deductions based upon the assumed preference of the Hebrew agriculturist for sunshine are worthless.

The same facile assumption of general principles is observable throughout. If it becomes necessary to disregard time in adapting a legend or a religious belief to the desired explanation, we are gravely told as an incontrovertible truth "that at the earliest mythical stage the distinction of time is very feebly presented" (pp. 42–3); as though man, when sufficiently advanced to have invented language and constructed elaborate and fanciful personifications of the processes and relationships of nature, had not an idea of the sequence of time and events. In fact, these rude savages must have reached a point which other races did not attain until their full development, for they must have discovered the solar year of 365 days if Prof. Goldziher be correct in identifying Enoch with the sun chiefly for the reason that he is said to have lived 365 years before his translation to heaven (p. 126). Yet of the rude nomads who must thus have solved the problem which puzzled Rome until the time of Cæsar it can be said that "mythic thought did not attain to the category of causality; for this category presupposes a clear consciousness of succession, or of one event following another in the order of time" (p. 43).

Having thus released himself from all trammels of reason and fact, it is easy for the mythologist to assert all necessary postulates and deduce from them whatever conclusions he may desire. Any vocable which can by any philological process be tortured into the sense of motion, or rest, or red, or white, or round, or hairy, or breaking forth, is at once proclaimed to prove that its possessor is a solar hero. Thus, the name Hagar is assumed to be formed from a root *hajara*, unknown to Hebrew, signifying "to fly," and, as one of the attributes of the sun is its flight through the sky, it follows at once that "the mythic designation Hagar is consequently only one of the names of the sun in a feminine form"; and, as Abraham had previously been proved to be the night and Sarah the moon, we are told of the domestic difficulties of the patriarch that "the battle of the two figures of the night-sky against Hagar is again that inexhaustible theme of all mythology, the battle of Day with Night" (p. 119). So, if the idea assigned to the name or history of the personage be that of rest, then he must be the sun sinking to his rest after the movement of the day, as in the case of Noah (p. 131). Asher, on the other hand, the son of Jacob, is declared to be self-evidently a solar name, because the root *ashar* (אשר) has a significance of walking straight forwards, besides its ordinarily accepted one of pronouncing happy (p. 122). Similarly, Dan is no longer, as heretofore, to be derived from *din* (דין), "to judge," but a root must be found for it elsewhere, in some other Semitic tongue, which can be wrested into the significance of movement, and thus both Dan and his sister Dinah "must denote he or she who marches on, or comes nearer, or goes in general, synonymous with Asher—*i. e.*, the Sun" (p. 124). And this identification of Asher with the sun enables the author to solve the hitherto insoluble problem as to the exact meaning of the mysterious Asherah, who consequently becomes the feminine counterpart, or wife, of Asher the sun—though, curiously enough, this counterpart, or wife, is said to be the moon, in violent contradiction to what we have just seen of the quarrel inevitable between the sun and moon in their characters of Hagar and Sarah. Returning to Dinah, we find that as Shechem (p. 25–6) had already been proved to represent the morning dawn, it becomes self-evident that her misadventure with him meant only that "the Dawn snatched up the sun to himself and was united with her." Moreover, the

* 'Mythology among the Hebrews, and its Historical Development. By Ignaz Goldziher, Ph.D., member of the Hungarian Academy of Sciences. Translated from the German, with additions by the author, by Russell Martineau, M.A., of the British Museum.' 1 vol. 8vo, pp. xxxv.-457. London. 1877.

vengeance taken by the sons of Jacob (the Night-Sky) is merely the destruction of the sun when it sinks at evening (p. 125); and as Shechem is the son of the Ass (Hamor), we are led to a further identification, since "the reddish-brown ass is one of the animals used in the old mythology to designate the Sun" (p. 181).

Esau, too, is the sun, because he is described as a hunter, and "the Sun is a hunter; he discharges his arrows—*i.e.*, his rays—and does battle with them against darkness, wind, and clouds"—besides which he is red and hairy, which is conclusive (p. 133–7). This redness, in fact, is an important symptom, for though Laban is likewise the sun because his name signifies "white" (pp. 140–1), the sun's distinctive color seems to be red. The name of the father of mankind has hitherto been considered by scholars to mean father or man. Lenormant tells us that *Adda* in Proto-Medic and Accad is "father," and when pluralized in the ordinary way by the addition of the radical *mes* it becomes *Addames;* and George Smith and Sir Henry Rawlinson assure us that in Assyrian Adam means "man," and Admi, Adami, or Adamu means the dark race, as distinguished from the Sarku, or light race. This would seem to afford abundant explanation of the name of our prototype, but Prof. Goldziher pays no attention to such commonplace derivations. Esau, as we have seen, is the sun, because one of his appellatives was Edom (אֱדֹם), or "the red." Now Adam (אדם), we are told, "is, as is obvious at a glance, a solar appellation, 'the Red' (אדֹם); etymologically the same word as Edom" (p. 209)—and this, of course, settles the question. So Eve, or 'Havvah, is "the Circulating," "the feminine synonym of Zebhulun, 'the Round,' a very ancient appellation of the sun" (p. 210). Cain and Abel are only a repetition of the all-pervading myth. Cain, who is the sun, slays Abel, who is the night (p. 110). Lot and his daughters are likewise a solar myth. Lot means "he who covers," and "surely no one will, after all this, doubt that the name Lot is a designation of the 'covering Night,'" and his daughters the morning and evening twilight (pp. 189–96). Jonah in the belly of the whale is only the sun swallowed by the sea to be "spit out on the shore" (p. 102).

So the author runs glibly on, through nearly four hundred octavo pages, flippantly flinging around his crude guesses as the positive deductions of a rigid scientific analysis. Any one familiar with the extraordinary system of exegesis invented by the Amoraim of the Talmud for the purpose of making any given text bear any meaning which suited them at the moment, would imagine that the human mind could produce nothing more whimsically false, but the thirteen rules of interpretation which formed the instruments of the Halakhah are tame in comparison with the scientific methods of a resolute discoverer of nature-myths. The only previous system to which the latter can be likened is the "soul of souls"—the thirteen hermeneutical rules of the Kabbalists, and even these are commonplace beside the brilliant fancies of our author. To prove by Gematria that the world shall last six thousand years because the letter *aleph*, which signifies 1,000, occurs six times in the first verse of Genesis, is a much humbler exhibition of penetrating insight than to demonstrate that Jephthah (Yiphta'h) is the "Opener," or Sun, who slays his daughter, the morning twilight (pp. 97–104). Equally poverty-stricken is the imagination of the Bereshith Rabba, which explains the hidden significance of the name of Isaac (יִצְחָק = Yits'hak) by pointing out that the yod (י), or 10, means the ten commandments which the patriarch studiously observed; the tsade (צ) or 90, is the age of his mother at his birth; the 'heth (ח), or 8, shows that he was the first who was circumcised on the eighth day after birth; and the koph (ק), or 100, signifies the age of his father, Abraham, when he was begotten. This is tame and spiritless enough alongside of the poetical science of the comparative mythologist explaining the myth "Abram kills his son Isaac." "At that primitive stage these expressions naturally signified no more than the words imply. 'אַבְרָם, Abh Râm, the *Lofty Father*, kills his son, יִצְחָק Yiṣchâḳ, the *Laugher*.' The Nightly Heaven and the sun, or the Sunset, child of the Night, fell into a strife in the evening, the result of which is that the Lofty Father kills his child; the day must give way to night" (p. 47).

One would feel more disposed to yield to the blandishments of this new science were it not for observing that occasionally the results of its methods, tried by its own standards, seem not to be as infallibly accurate as its professors assert. In other sciences given data must yield the same solution, whatever be the process employed or the person employing it, but in comparative mythology given data apparently will yield any result that the manipulator desires. Thus, on p. 97, we find that our author proves to a demonstration that Jacob (Ya'akob) is "the afterfollower," or Night—in fact, a mere repetition of his grandsire, Abraham, or the Lofty Father; but turning to p. 434, in Steinthal's appended essay on Samson, that eminent precursor of Goldziher assures us that Jacob is identical with Heracles Palæmon, and therefore is a form of the Sun-god. Between two such conflicting authorities it is not easy to decide, unless some new development of the science shall enable a third professor to reconcile the apparent discrepancy, by proving through strictly scientific methods that the Sun and the Night, in mythical language, are one and the same thing—a feat which could readily be accomplished through the interpellation of the Egyptian Tum, the sun of the under world.

Professor Goldziher's book, in short, reads like the nightmare of a professor in the Academy of Laputa; and if it were not that so serious a scholar as Mr. Martineau has thought it worthy of translation, we should be inclined to regard it as a huge and ponderous mystification, after the German fashion, designed to burlesque the labors of his forerunners in the "science."

SULLIVAN'S NEW IRELAND.*

MR. SULLIVAN, who has long been a prominent Irish member of the House of Commons, offers in the present volume a series of sketches illustrative of the political and social changes which have taken place in Ireland within the last thirty years—that is, since the famine of 1846–7. The book is badly made up in one respect. It has no index, and the headings of the thirty-three chapters which compose it give, in eleven instances, only the faintest idea of the subject of the chapter. The other twenty-two seem to be the mysterious titles of a popular novel, such as "Looking Back," "After Scenes," "The Crimson Stain," "The Suicide Banker," "A Troubled Time," and "Delenda est Carthago." The reader in search of serious information who should be deterred from taking it up by this peculiarity of the table of contents, would, however, make a mistake. Mr. Sullivan is a serious writer, and has managed to put into a very taking shape the sum and substance of the last half-century of Irish history. But then it is not in a shape, unless we are greatly mistaken, which will attract many readers who are not Irishmen, or have not followed recent events in Ireland pretty closely. He is, as we have said, rather an elucidator than a narrator. He presumes on the reader's knowledge of a large mass of facts of which few but Irishmen know anything, and he devotes a good deal of space to some facts the importance of which few but Irishmen will appreciate. He virtually acknowledges all this in his preface, in saying "that it was not his purpose to write a formal history of the period, but to supply a series of sketches or narratives which may, perhaps, assist the reader in the readier and more correct appreciation of visible results." The chief reason for referring to it as a defect of the work is that he "has kept in mind the fact that his book will be published and read in England," and he might have added in America also, and has had the "ambition to hope that it might assist in promoting a kindlier feeling between the New England and the New Ireland."

Some of his reminiscences of the old and vanished Ireland are very touching, but nearly all the changes he describes are for the better. The National Schools, the cheap press, and the increased facility of locomotion, have made one great revolution in Irish politics in making personal leadership, such as it was in O'Connell's day, impossible. There cannot be in Ireland such another tribune as he was. For the same reason Mr. Sullivan maintains that the priests do not possess, and cannot acquire, the political influence they once held. The power enjoyed by O'Connell and the Catholic clergy down to 1848 was the natural result of the gross ignorance and political subjection of the Catholic population. For over a century the priest was the one man of education the peasant knew and confided in, and O'Connell was the first Catholic politician who took up the cause of his countrymen with courage and ability. Since that day the popular horizon has greatly broadened, popular self-confidence has greatly increased, and the habit of forming one's own opinions with the aid of the newspaper become strong and widespread. This, too, accounts in a considerable degree for the sorry figure in the matter of leadership which Irish discontent has cut of late in the eyes of many people, as compared with its manifestations in the old days of the Volunteers and the United Irishmen. The Fenian and Home-Rule chiefs do not compare well as regards character and station with the earlier apostles of Irish liberty, but the explanation is that it is now far harder to lead than it used to be; neither character nor station counts for much.

* 'New Ireland. By A. M. Sullivan, Member of Parliament for Louth.' Philadelphia: J. B. Lippincott & Co. 1878.

In other words, to put the matter in a sentence, the Irish people has been somewhat democratized.

Another powerful agent in transforming Irish opinion and manners has been the emigration to America, and the great increase in closeness of relation between the Irish settlers in this country and their friends at home through cheap postage and cheap steam communication. But that the influence of this has been wholesome in any way except in stimulating enterprise, few will maintain. There is probably no country in the world to which the average Irish peasant was less fitted to come, as regards moral and mental outfit, than the United States. He never gets here more than an imperfect comprehension of the laws and manners, and their effect on him is to destroy or greatly enfeeble some of his most valuable prejudices and traditions, without supplying any better to take their place as motives or guides. In fact, the Irish people would not have been ready for emigration to this country, as things have gone and are going, before the year 1925 ; and if it were not for their children's sake, one would regret that it began any sooner. There was no people in Europe farther from republicanism or democracy in 1829, the date of Catholic Emancipation. Mr. Sullivan seems to have some inkling of this himself, but of the unfortunate effect of the emigration to the United States on the Irish political reputation he seems to have none. Probably nothing has done more to destroy foreign sympathy for Ireland, and foreign interest in Irish questions, and to separate Irish Liberalism from Liberalism everywhere else, than the part played by the Irish vote and Irish politicians in America.

Mr. Sullivan's account of the Irish share in bringing about the disestablishment of the Anglican Church and of the formation of the "Home-Rule" party, as well as his illustrations of the working of the Encumbered Estates Act and of Gladstone's Land-Tenure Act, giving a measure of protection to the tenant-farmers against landlord exactions and oppression, are highly pictorial, but will be found a useful key to much that is still puzzling to foreigners in Irish politics. They furnish, too, an explanation of the difficulty that English and Irish legislators have in working together. Indeed, Mr. Sullivan's own talk about Irish questions would almost suffice for that purpose. He is full of sentiment and enthusiasm on every subject he touches. Smile follows tear and tear smile, no matter of what he is treating. For literary and art purposes nothing can be more attractive or effective than this state of mind ; for the work of constitutional government nothing more unfortunate. It was a true, though perhaps melancholy, saying of the late Mr. Bagehot that it is the humdrum, unimaginative peoples who have succeeded in politics, and it is a saying that Irish politicians cannot take too much to heart.

Money and Legal Tender in the United States. By H. R. Linderman, Director of the Mint. (New York : G. P. Putnam's Sons. Pp. 173.)—The frequent citations from Dr. Linderman's little work by the *Nation*, in the current discussion of the silver question, is the best testimony we can offer as to its usefulness. It does not purport to be a systematic treatise on money, or a treatise of any kind, but a convenient hand-book on coinage, legal tender, mint regulations and the reasons for them, and the statistics of this and foreign countries relating to the subject treated, with sufficient argumentative treatment to connect all the branches of the work together. Nevertheless, the chapter on the proposed remonetization of silver in the United States is as concise and comprehensive and dispassionate as any argument that has come from the press since the controversy began. The conclusions of the author upon this point are, that the Bland Silver Bill is an unwise measure under any circumstances ; that if silver is to be remonetized at all it should be done by international action ; that if international action is postponed, the French basis of 15½ to 1 should be adopted, so as to leave the door open for international arrangements hereafter ; and that "free coinage," at the present difference between gold and silver in the markets, would be an evident swindle. In all these particulars Dr. Linderman approves himself well qualified to write upon these questions, and to fill the office he holds as Director of the Mint.

As to merely technical matters, such as the coinage and legal-tender acts, the par of exchange, subsidiary coins, foreign coins and their valuation, etc., nothing could be more lucid and methodical than his arrangement of the several subjects and his treatment of them. He furnishes a candid statement of the reasons for passing the Act of February 12, 1873, in which the silver dollar of 412½ grains was dropped from the list of authorized coins of the United States, and gives an account of the reasons for coining the trade-dollar, and of the success which has attended the operation in our intercourse with China. These reasons, in brief, are that there was a large market for silver in China, and that the Chinese, like other people, were disposed to give a preference to the article which came nearest to their tastes and customs and which best answered the requirements of goodness, uniformity, and convenience. Such an article was the Mexican dollar until the American trade-dollar made its appearance in the Chinese ports. "It is the best dollar ever seen here," says the Hong-Kong and Shanghai Banking Corporation. Its popularity has been remarkable, when we consider the conservative character of the Chinese populations. Dr. Linderman's success in this particular—for he was the projector of the trade-dollar—is in no sense different from that of any manufacturer who diligently studies the wants of his customers and adapts his wares to them. The trade-dollar is a silver ingot of the form, size, weight, and purity most liked by the people who buy it, and the market for American silver has been essentially improved by it.

The appendix contains about fifty pages of valuable statistical matter, bearing upon the silver question, the production and distribution of the precious metals, and cognate matters.

Music in the House. By John Hullah, LL.D. (Philadelphia : Porter & Coates. 1877.)—"It may be accepted as an axiom that no musical performance is so delightful as that to the production of which we ourselves contribute." If we except operas, oratories, and symphonies, and thus limit Dr. Hullah's statement to chamber-music, or "music in the house," it may be regarded as correct. Such music loses much of its effectiveness when transplanted from the parlor into the spacious concert-room, for which it was never intended. There is in our American and English homes a regrettable deficiency of concerted music for piano and violin or 'cello, for string quartettes, and for the other possible combinations of string instruments. The little book before us is a plea for this class of music, as well as for such vocal music as does not call for a large chorus. There was a time when musical culture was so common in England that at an evening party it was considered an odd thing if a guest was found who could not join the chorus. But the irrational policy of a church which mistook musical enjoyment for mere pleasure of sense, and accordingly condemned it, put an end to this state of affairs. At the present time the exclusive devotion of our young men to athletic sports is the chief impediment to æsthetic culture. They will be interested to learn that Dr. Hullah thinks that for a general increase of skill in violin-playing in the immediate future we must look to female aid ; and he aptly reminds us that the old prejudice against female violinists is rapidly dying out, just as the piano long ago ceased to be regarded as exclusively "a woman's instrument."

After a general introduction Dr. Hullah treats, in three chapters, of "unaccompanied vocal music," "instrumental music," and "accompanied vocal music" for the house, briefly alluding to the history and literature of each division. Then come two more chapters on "practice and rehearsal," and "the musical library." The reader will find some useful hints regarding the selection of pianos and of music for performance, the treatment of the voice, and the relations of words to music, besides some general information and gossip. But otherwise we cannot say much for the book, although we thoroughly sympathize with its aims. Properly condensed, it would have made an interesting magazine article, but there is scarcely enough matter or thought in it to give it a *raison d'être* as a book. However, if a person wishes to spend a dollar on music it will be infinitely better to buy such a book than to encourage by purchase the manufacture of the abominable sheet-"music" which our publishing houses are turning out every week by the wholesale.

A History of the United States of America, including some important facts mostly omitted in the smaller histories. Designed for general reading and for academies. By Josiah W. Leeds. (Philadelphia : J. B. Lippincott & Co. 1877. 12mo, pp. 468.)—Mr. Leeds's history of the United States is in refreshing contrast to the common run of school histories. Not that we have any fault to find with the best of these ; they have improved vastly within the last few years, and there are several which could hardly be improved for their purposes. But even these seem to be all cast in one mould, and to vary very little from one another in substance. Mr. Leeds has set before himself a different task—to write a history of the civilization of the country rather than its wars and political history. He has undertaken to do, in a modest way, what Mr. Green has done for England—to write a history of the American *people ;* and his success is good. The book is, therefore, well adapted to be a sequel or companion

to a school history of the ordinary type, as containing much matter omitted in that class of books, and occupying a wholly different point of view. Or, it will answer as a sole manual for any who may desire to have the military history relegated to a secondary place.

Mr. Leeds appears to be a Friend, and maintains the principles of his creed even in a school text-book. His style is on the whole good, sober but not dull; we notice the frequent abomination of *transpire* in the sense of *happen*. Much the largest part (twenty-one chapters out of thirty-two) is devoted to the Colonial period; and this period is very well and perspicuously arranged. The titles of the chapters, too, are often graphic: "The Spaniards—their cruel treasure-hunt"; "George I. A period of Financiering." The period of the Republic is treated with less fulness, sometimes several administrations being compressed into one chapter; and the Revolutionary War occupies only one chapter of nineteen pages. On page 17 we find mention of a brief of Pope Nicholas V. of 1498; in this year Alexander VI. was Pope. In the "Physical Aspect of the Country" (page 13) the description is quite inadequate, as no notice is taken of the remarkable system of lakes and rivers (the St. Lawrence, etc.) by which the Mississippi Valley is directly connected with the Atlantic. The great schemes of French empire on this continent were built upon this, the most striking feature of our physical geography.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers—Prices*
Delafield (Julia), Biographies of Francis Lewis and Morgan Lewis, 2 vols., swd.	(A. D. F. Randolph & Co.) $2 00
Fernow (B.), Dutch and Swedish Settlements on the Delaware River. Vol. XII.	(Albany)
Hill (C. S.), Our Merchant Marine, 3d ed.	(D. Appleton & Co.)

G. P. PUTNAM'S SONS,
182 Fifth Avenue, New York,

Still continue to make it a special and important part of their business to attend to orders for PUBLIC INSTITUTIONS and INDIVIDUALS who desire to have accurate information and suggestions as to the best books and the best editions, and to purchase what they need, whether in thousand or a single book, in the most economical way. Orders for American or Foreign Books of every description, whether for whole libraries or for single books, are carefully and promptly executed. The experience acquired by thirty-seven years' study of this *specialty* on both sides of the Atlantic will, it is believed, be useful to book-buyers with reference to choice of the best books and the best editions, and also with reference to ECONOMY.

English and American Catalogues supplied.

Send for "The Best Reading." "Supplies a need that has long been felt." A valuable classified Bibliography. Paper, $1 25; cloth, $1 75.

They also issue "The Library Companion," a Quarterly Supplement to "The Best Reading," price 50 cents a year.

They receive subscriptions at clubbing rates for all periodicals American and Foreign.

The one who writes under the pen-name of Stuart Sterne, and whose writings have shown an increasing beauty of expression, flowing, graceful diction, has sent out a new poem, entitled 'Angelo.' It is sweet and tuneful, its flow is always easy, and its imagery tender and lovely. It is seldom anything so good comes from one who only uses a pen-name.—Boston Traveller.

The Sort of Claims Resisted.

All honest claims against THE TRAVELERS INSURANCE CO. are promptly paid; and there is always a real satisfaction in giving an honest claimant the full benefit of his insurance. There are those, however, who try to speculate upon their policies by making claims and bringing suits for money to which they have no legal or equitable right, but which they hope to obtain by an unfair appeal to the prejudices of jurymen against corporations. In such cases the company has no alternative, and must defend itself, cost what it may. Several claims of this character have quite recently been decided in favor of the company.

Horace Gowan, of Dover, N. H., holding a policy of insurance against accidents for $5,000, died of typhoid fever. Suit was brought by Attorney Copeland, and tried in the U. S. Circuit Court. *Verdict for the Company.*

Thomas R. Taylor, of Leavenworth, Kansas, committed suicide while under indictment for robbing the U. S. mails. He held accident policies to the amount of $5,000. Suit brought and tried to a jury. *Verdict for the Company.*

William Preston, of Dover, N. H., was killed in trying to jump upon a moving train. Case tried to a jury, which disagreed, ten for the Company; two, however, voted for the plaintiff, declaring openly that they voted that way "*so as to rebuke other insurance companies*," showing that their desire to "rebuke" other companies was stronger than their desire to be honest with THE TRAVELERS.

T. D. Lyon, Ottumwa, Iowa, brought suit against the Railway Passengers Assurance Company for a case of partial disability. Tried to a jury; *verdict for plaintiff*, under a charge of the judge that in some cases "partial disability" might be "total disability." The Supreme Court held the rulings of the judge below to be erroneous, and set aside the verdict.

Rev. David Kleine, residence nowhere, made several claims under accident tickets, all of which claims, though exceedingly suspicious, were paid. At last, however, he tried it again for "a general concussion of his system," occasioned "by a railway train running into a team"; but as the records of the railway company disclosed no such disaster, and the evidence discovered no such injury, the claim was rejected. Suit brought and tried to a jury in New York, when his "system" had another "concussion" by a *verdict for the Company.*

The stereotyped and stale appeal to the prejudices of jurymen against corporations is pretty well worn out, and the courts are beginning to see the propriety of trying the merits of the case, rather than the strength of parties litigant.—*Travelers' Record.*

The Sort of Claims Paid.

The check doesn't restore the lost eye, but is a material help of special value under such an affliction:

NO. 11 SWAN STREET, ALBANY, Nov. 21, 1877.

GEORGE W. SHERMAN & CO., Managers TRAVELERS INSURANCE COMPANY, of Hartford, Conn.:

GENTS: Your check for two hundred and sixty dollars ($260) in payment of my claim for injuries received by me on the 17th day of last May, being in full for twenty-six weeks, at ten dollars per week, was duly received by me this morning. You know how much I appreciate the insurance, and I unhesitingly recommend the "TRAVELERS" to every one as the embodiment of promptness, fairness, and all that is to be desired in personal insurance.

Very respectfully yours, MATTHEW C. CLARK.

Hurt by a simple slip or misstep:

MARSHALLTOWN, IOWA, Nov. 24, 1877.

TRAVELERS INSURANCE CO., Hartford, Conn.:

DEAR SIRS: Please accept my sincere thanks for the prompt attention paid my claim, rendered on account of a severe sprained ankle, having received your draft for $125, at the hands of Mr. Harry Bradley, your gentlemanly agent at Cedar Rapids, Iowa.

I am, yours truly, BILLY H. WEEKS.

The hazards of railway service bring in many such as this:

SPARTA, WIS., December 1, 1877.

J. H. NOLAN, Gen. Agt. TRAVELERS INS. CO., Chicago:

DEAR SIR: I am in receipt of your check for $500, being payment in full, under accident policy held with your company on the life of my son, Joseph Ebert, who met his death while in the discharge of his duty as brakeman on freight train.

I desire to express my most sincere thanks for the very prompt manner on the part of the Travelers Insurance Company in adjusting this claim, and paying same without the least delay, and without any trouble or expense whatever on my part in preparing the claim; and recommending your company most cheerfully, I am,

Respectfully yours, BARBARA EBERT.

Dr. Daly shall be heard next. He devotes a few weeks every year to hunting, and has insured in THE TRAVELERS on such occasions, thinking himself safe enough at other times. But before his last trip he was persuaded to take a yearly policy, and within two months his horse switched him in the eye.

328 FIFTH AVE., PITTSBURGH, PA., Dec. 17, 1877.

I. R. STAYTON, Esq., District Agt. TRAVELERS INS. COMPANY, Pittsburgh:

DEAR SIR: I hereby acknowledge the receipt of two hundred and thirty-two dollars and fourteen cents ($232 14), indemnity for nine weeks and two days disability, at rate of twenty-five dollars a week, for an injury to my eye caused by the switch of a horse's tail. I take great pleasure in commending the prompt, business-like way in which just claims for accident are settled by the Travelers Insurance Company; and while I trust no further accident may befall me, yet I shall in future never be without a policy in THE TRAVELERS.—Yours very truly,

W. H. DALY, M.D.
—*Travelers' Record.*

The Nation.

NEW YORK, THURSDAY, JANUARY 17, 1878.

The Week.

THE adjourned meeting of the bankers on the Silver question was held in this city on Thursday last. Representatives of fifty New York banks or insurance companies were present, of four Boston banks, and of one Philadelphian. The committee appointed to report on the question what effect the substitution of the 412½-grain dollar for gold would have on general business and on the institutions under their charge, and what measures should be taken to save their capital from the loss that would be caused by the change, reported that the proposed change would reduce the standard one-tenth; would prevent resumption in 1879; would seriously injure the public credit by defrauding the bondholders, and would cause a general prostration of business by the total destruction of confidence in the future, and by the creation of a standard so fluctuating that it has varied between January and July, in a single year, from 95 to 79⅝ cents. As to the measures to be adopted, the report recommended the appointment of a committee made up of New York, Philadelphia, and Baltimore bankers and merchants, to memorialize Congress against the pending Silver Bill and for a legal provision that if silver is made a legal tender, it shall be made a legal tender at its value in gold, and to keep a watch generally against attacks on the standard and on the public credit.

Mr. William E. Chandler's movement against the President, which was begun apparently with immediate reference to the approaching meeting of the Republican Convention in New Hampshire, has had for him an unfortunate termination. Instead of being received as a hero or "Moses," he found himself the object of much gross personal abuse from several prominent delegates, one of the oldest Republicans in the State, Mr. Tuck, calling him a "political tramp." The platform reaffirmed the Cincinnati platform, and particularly the civil-service part of it, in emphatic terms, eulogized President Hayes "while acknowledging honest difference of opinion with regard to past acts," denounced the anti-resumption movement and the silver movement, and pronounced factious and mischievous all attempts to reopen the Presidential controversy, or to question the President's title. In fact, the general result left Chandler in a somewhat ludicrous and humiliating position, and the newspapers have ever since been ridiculing him in an unkindly way. We must say on the poor fellow's behalf, however, that he is no worse and no better now than he was last fall when he was working in Florida to get a "fair count," and filling earth and air with his manifestoes and defiances. It was his despatch the day after the election which informed the smaller "workers" in Florida and South Carolina and Louisiana that all was not lost, and that the managers expected them to beat the enemy in making up the returns. He superintended the good work himself in Florida, but not being a bird, as Sir Boyle Roche remarked, could not be in Louisiana at the same time, though his mouth must have watered when he heard and thought of the job Wells and Anderson had on hand. He is altogether a sorry sort of person for a moral party to have on its National Committee, and it is well he has been found out even now, if the better portion of the party will only learn something from the little trickster's career.

Senator Edmunds, of Vermont, has written a letter to the President expressing entire agreement with him in his views concerning the proper relations of the Executive and the Senate in the matter of appointments, and condemning the present custom of allowing Senators and Representatives to fill offices with their personal adherents, in terms with which everybody is now familiar. He says he is himself so fully convinced of the impropriety of volunteering recommendations for office to the Executive that he abstains from it, and thinks his course satisfactory to his constituents; but observes very truly that, "to have proper and fair effect, whatever course is pursued ought to be uniform, constant, and universal"—in other words, if one Senator is to abstain from soliciting offices for his friends, all must do it. Mr. Edmunds no doubt sees, and his letter will suggest to everybody who reads it, the fact that no general agreement on the part of Senators to abstain from office-soliciting will last long if the Executive is forced by necessity to apply constantly or frequently to them and Representatives for information about candidates, and that this necessity must exist as long as changes are as frequent as they now are. Nothing but greater fixity of tenure will make the President's nominating burden so light that legislators can be asked for advice without risk of dictation.

We regret to perceive as yet no sign of any effort on Mr. Conkling's part to restore Harmony in the Party. Of course, we understand perfectly his annoyance at the President's interference with his Courtesy and his Custom-house, but then it is human nature for the President to do what he has done, and it was probably suggested to him by the Constitution and the party platform, and surely Mr. Conkling is too practical a man not to know that he must deal with human nature as he finds it. The Solid South is marshalling its forces for an assault on the Treasury, and we are threatened with the destruction of public and private credit through the Silver movement. Are these the times, therefore, for a Senator to quarrel over a question of patronage? We ask him once more, while feeling deep sympathy for him, whether he ought not to let Hayes have his way about these comparatively small matters, and use all his vast influence to bind the party into a solid phalanx against the repudiators. We greatly fear that if he does not Hayes will sign the Silver Bill, and Mr. Conkling will be answerable for the consequences. Many silly little civil-service quacks will doubtless jeer at this advice, but we are talking to a great man who understands us, and we do not mind what visionaries and tea-caddy politicians say or think.

Congress reassembled on Thursday. In the House the first thing in order was Fernando Wood's resolution authorizing the regular committees to investigate at any time the administration of all the departments, and to send for persons and papers. The absence of a certain portion of the majority enabled the Republicans to amend this in Committee of the Whole, with a fair prospect of depriving it of its worst features, by compelling committees to apply to the House for the much-abused power to send for persons and papers, or by ordering the charges to be presented to the House in writing, with an endorsement by one or more members that the charge was sustained *prima facie* by evidence. Mr. Foster also desired to investigate the manner in which the Democrats of the Forty-fourth Congress had dispensed their investigation funds. On Friday, however, Mr. Wood found himself with his usual backing, and his so-called "drag-net" measure was promptly adopted in all its integrity. Mr. Kelley made two ineffectual attempts to induce the House to hold a Saturday session for the purpose of listening to the arguments of women in favor of a female-suffrage amendment of the Constitution. In the Senate, Senator Sargent had a like experience, but he introduced the amendment in question, which forbids the States to disfranchise on account of sex. Mr. Edmunds had another amendment, which it is safe to say will not be adopted in the form in which he presented it. It prohibits State establishments of religion or interference with the free exercise of religion, religious qualifications for office, sectarian appropriations, etc., but expressly excepts the reading of the Bible in schools as not within the intent of the prohibition. Mr. Edmunds also offered a substitute for Senator Matthews's pernicious Silver resolution, and so worded it that the rejection of it will place its opponents in a very awkward posi-

tion. It affirms, as the Matthews resolution denies, that the faith of the Government is pledged to redeem all its obligations in gold. Judge Davis presented petitions for and against remonetization from his own State and neighborhood, and took care to remark (as if it were somehow relevant) that the former represented the great majority of his constituency. On Tuesday Mr. Voorhees treated the Senate to a *bouffe* performance by making a long speech in favor of repudiation, on the text of his resolution declaring that the national credit ought to be maintained.

On Monday the President sent to the Senate a long list of new nominations, including several collectors of customs; but the New York collector was not among them. Noticeable, on the other hand, was the reappointment of James M. Edmunds as postmaster at Washington, in spite of his well-known connection with the "machine," and in spite of the fact that he has already served two terms of four years. We are glad to see any evidence of Mr. Hayes's abandoning the queer notion that a tenure of eight years is as much as any office-holder is entitled to in a reformed civil service; but there have been worthier occasions than Mr. Edmunds for a return to sounder doctrine. The nomination of Lucius C. Northrup to be District-Attorney of South Carolina was a surprise to those who had asserted, and still assert, that Mr. D. T. Corbin, lately a claimant for a seat in the Senate, was the President's first choice. We do not know what Mr. Northrup's fitness may be, but Mr. Corbin's appointment would have been a disregard of proprieties such as President Grant used to show when he stood by his subordinates "under fire." Mr. Corbin is accused in South Carolina of having bribed the Mackey House of Representatives to vote him United States Senator; and whatever truth there may be in this charge, the State authorities are evidently in earnest in prosecuting it, and Mr. Corbin's appearance in South Carolina, in any capacity, would lead to his examination and trial for a penal offence. This is not exactly the kind of greeting a United States District-Attorney should be subjected to if it can be avoided, and the country may congratulate itself on having been saved one more scandal.

The woman-suffragists have held their annual convention in Washington this year and have made a determined assault on Congress, Mr. W. D. Kelley being, owing to his remarkable open-mindedness, their leading champion. They tried hard to get permission to address the House and Senate in person, but this privilege was sternly refused. They had one great triumph, however, in obtaining a promise from the President that he would sign any woman's-rights bill that Congress might pass—the reckless man that he is. Vice-President Wheeler stood by them, on the whole, more boldly than anybody, and is fully abreast of the most advanced thinkers of the party. They relied, womanlike, a great deal on interviews with individual Senators and Representatives in the lobbies, which obliged the more susceptible or bashful legislators to stick very closely to their places. Mr. Conkling, in particular, was the object of much pursuit, his "torso" having been long a subject of admiration to the friends of the cause. Senator Hoar also displayed great interest in the proceedings, but not so pathetic an interest as Mr. Wheeler's.

Mr. Schurz, as every one expected who knew anything of the condition of the Interior Department, and especially of the Indian Bureau, is bearing the brunt of such reform work as the present Administration has undertaken, and is naturally exposed to the most savage attacks, and, in the opinion of many of those who have had experience of the great diversity and multiplicity of influences which work for the Indian Ring, he will be eventually broken down. Of this, however, we have no fear, if the President holds firm and does not have "his mind poisoned" like his predecessor. One of Mr. Schurz's best pieces of work, reminding one of Mr. Bristow's assault on the whiskey thieves, we described in our last number. He instituted a real committee of investigation, composed of an army officer, Major Bradley; of Mr. McCammon, supplied by the Attorney-General from his own office, and of the chief clerk of the Indian Department. This commission examined Mr. Galpin, the chief clerk of the Indian Bureau, for twenty days, and convicted him, among other things, on his own confession, of having kept back charges against fraudulent contractors on the ground that he knew the men and believed them innocent.

The Ring are now busily at work trying to break the force of these revelations, and have managed to seduce a good but not very perspicacious man, President Seelye, into writing a private letter from Amherst, from which they have published extracts, giving his opinion that "the report of the Board of Enquiry into Indian management was a gross travesty on justice secured by a combination of corrupt and adroit men." We were under the painful necessity, while Mr. Seelye was in Congress, of expressing our belief that he was by far too guileless and too unfamiliar with the processes and subjects of legislation and with the ways of politicians to render real service to reform, but we confess we were not prepared for his writing reckless despatches for the use of corrupt speculators and scoundrels of various degrees, pronouncing an investigation at which he was not present, conducted by men whose character is as good as his own, and who are far his superiors in sagacity, a "gross travesty on justice," and testifying to the high character of a clerk who by confessing the suppression of charges against contractors has confessed himself presumptively guilty of connivance at fraud.

The Netter and Bonner failures resulted from the loss of money obtained by the "rehypothecation" of stocks and bonds. This method of getting money and failing was a new dodge in Wall Street; but it appears there were others yet to be discovered, for on Thursday Mr. E. J. Dunning, jr., a young note-broker who had the confidence of the banks and of business firms, and deservedly so, so far as his character goes, suspended. His liabilities were about $900,000, and the larger part of these were due to the banks from which he had borrowed money on pledge of mercantile notes. His method of doing business appears to have been something like this: as a note-broker he would buy the notes of mercantile firms whose facilities for getting money were not the best; these he would pay for with checks on his bank, which checks the bank would "certify" were good. He would then take these notes to other banks or money-lenders, and sell them or borrow on them; if able to sell them at a profit, or to borrow more on them than he paid for them, he would deposit the money in the bank which "certified" his check, thereby making his account good. In case he was unable so to sell or borrow he would then turn the notes into the bank which "certified" his check, to be held until he could borrow or sell at profit. If able to do this before the paper or notes matured, his own bank would be secured; if not, his bank would lose whatever was lost, less the amount by which he could reduce it with his own money. This appears to have been the system, and it will be seen that in effect it amounted to this: that he used the funds of the bank, and was to make all the profits by such use, while the bank was to take all the losses, less whatever might be the ordinary profits of Dunning's account at the bank. It is charitable to believe that this is an exceptional feature of bank management in New York. As the result of Dunning's suspension, several of his mercantile customers have already failed, and at the close of the week efforts are making to secure a "settlement" which shall prevent other failures. The price of gold fell during the week to 101⅛, the lowest since April 30, 1862. This price makes the gold value of the promise of the Treasury to pay a gold dollar $0.9816. The London market for U. S. bonds advanced as gold declined here. Silver in London ranged between 53⅜ and 54*d.* per oz., the latter price making the bullion in a 412½-grain silver dollar worth $0.9010 gold.

The death of Victor Emanuel is the severest blow the Italian people has sustained since that of Cavour, and, indeed, it may be said that without the King Cavour would not have been possible, nor the King without Cavour. The King was neither a great statesman nor a great soldier; the remarkable thing in his career was

that having been brought up in the most priest-ridden and absolutist court in Europe, he was able at the right time to convert himself into a constitutional monarch, and to stay constitutional for thirty years without ever wavering, and to give steady support to a minister whose policy and plans were utterly opposed to all the traditions of his house. That this was not so easy as it seems is proved by the total failure of the various branches of the house of Bourbon, and by the long resistance of the Hapsburgs. It was the more remarkable in Victor Emanuel's case, too, because he was not a student or a thinker, or what may be called a serious man in any sense of the term. He was fairly ignorant, a man of pleasure, and a soldier of the *sabreur* kind, who liked to head a charge of cavalry vastly better than to direct strategical operations, and he never wholly got rid of his reverence for the Church; but having once entered on the path of constitutionalism he never winced or doubted or quibbled or looked back. Had he died before 1859 or 1866 it would have been a tremendous misfortune, and might have indefinitely retarded the work of unification; but Italy has been lucky in this as in other things, and did not lose him until he was really King of Italy and firmly lodged in Rome. His death even now, however, is very inopportune, as the Ministry is disorganized, the election of a new Pope is impending, and his successor Humbert has still to win popular confidence, his boyhood having been rather unpromising. The complications thus created are pretty sure to prevent that active participation on the part of Italy in the settlement of the Eastern question which many people have been expecting or predicting. The Papal enmity to the "Subalpine Monarch" seems to have dissolved in the presence of death. The King received the last sacraments, and the Pope apparently forgot the spoliation of the Church and the excommunications he launched at the King and his confederates, and remembered only that he was a great Italian, who had done and dared much for Italy.

The King's death occurred in the midst of a parliamentary crisis brought about by the inherent weakness of the Ministry and the fortuitous nature of the majority in the House. After much fumbling, a new Cabinet was proclaimed on the 26th of December, with the same nominal head, Depretis, in charge of Foreign Affairs, and with four other members of the old Cabinet retained, along with their portfolios—namely, Mancini, Minister of Justice; Coppino, Public Instruction; Mezzacapo, War; and Brin, Navy. The new members are Crispi, the well-known radical deputy, who will probably do more than any one else to give character to the Ministry, and who takes charge of Internal Affairs: Magliani, once an office-holder under the Bourbons, now entrusted with the Finances; Perez, Public Works; and Bargoni, formerly a colleague of Menabrea and Minghetti, who is given the "Treasury," a department just created by special decree and supplanting the Department of Agriculture, Industry, and Commerce. The peculiarity of the complexion of this body is that it embraces more deputies and fewer senators, and that it has been reinforced from the south of Italy. The conservatives, in fact, complain that Signor Depretis has been too much influenced by "geographical considerations."

The perplexity occasioned in England by the Russian successes seems hardly inferior to that of the Turks, as the moment has now come when Russia has to decide what kind of peace she will inflict on the Turks, and when Austria and Germany will have to reveal the nature of their understanding with the Czar. England insists on participation in the final settlement, as necessary to her honor and security; if Russia should deny her right to this, or insist on treating with the Turks separately, the situation would be very serious, for the remedy would be by no means plain. The Turkish army may now be said to have ceased to exist; and to fight Russia alone in Rumelia and Bulgaria, with any force England can raise and put in the field before next summer, is out of the question. The latest accounts lead to the belief, however, that Russia is moderate and conciliatory in tone, but the contingencies are so serious as to cause deep popular anxiety. The affair has been so mismanaged that even if the Cabinet were united in sentiment they would undoubtedly not be allowed to carry on the war, if war had to be made, and the Liberals are opposed to any war at all for the benefit of Turkey. There is now reported to be a growing desire for some decent protégé, say Greece, to take Turkey's place in the Eastern Question; but to this Lincoln's saying about "swapping horses in crossing the stream" is singularly applicable.

Scarcely had the Turkish position at Zlatitza, in the upper Topolnitza valley, been forced, and the connection broken between the forces retreating before Gourko and those defending the southern end of the Shipka pass, when a combined movement was made for the opening of the intervening Troyan pass. A turning column crossed the Balkans on by-ways, and almost annihilated a Turkish battalion opposing it; the fortifications in the pass were attacked in front, and finally abandoned by the defenders, when nearly surrounded, after a loss of three hundred killed. A movement on a larger scale was next executed in the same way against the Turkish army at Shipka, General Skobeleff—as is unofficially stated—leading a force through the Troyan pass and falling upon the enemy from the rear, and General Radetzki assailing the fortified Turkish positions in front. "After desperate fighting," on January 9, the whole Turkish army was captured, consisting, as the official bulletin of the Grand Duke Nicholas states it, of forty-one battalions of infantry, ten batteries, and one regiment of cavalry. A later bulletin speaks of ten thousand prisoners, which may have been the whole number of the survivors. General Mirski immediately occupied Kazanlik, and his cavalry spread through the Tunja valley eastward towards Yeni Zaghra and the railroad to Yamboli. General Kartzoff, moving westward, cleared the upper Gyopsu valley, occupied Klisura, and was there met by Russian detachments coming from Zlatitza and Teteven. Grand Duke Nicholas himself began crossing the Balkans through the Shipka Pass, while General Gourko's troops occupied Ikhtiman, which was naturally abandoned without a fight by the Turks. The latter, under Suleiman Pasha, fell back beyond Tatar Bazarjik, between which town and Philippopoli, according to the latest despatches, a severe battle was fought on January 14 and 15, ending with the further retreat of the Turks, and followed by the evacuation of the last-named city. Russians from Kazanlik appeared as far south as Tchirpan, a few miles from Adrianople, whence the civil government is reported to have been removed to Rodosto, on the Sea of Marmora, while tens of thousands of the inhabitants of Rumelia were fleeing to Constantinople.

On the same day on which the Russians achieved their great victory at Shipka their Servian allies stormed some heights commanding Nissa; other posts were taken on the following day, and on the 11th the town surrendered. The fighting had been protracted and severe, but the heavy losses of the Servians were richly compensated by the capture of a garrison of eight thousand with ninety cannon and twelve thousand rifles, as reported. Kurshumlie, abandoned by the Turks, was next reoccupied, and Vranya, south of Leskovatz, entered, while the bulk of the Servian army advanced on Prishtina. On the day preceding the fall of Nissa, Antivari had surrendered to the Montenegrins. The dismay which prevailed in Constantinople on the announcement of all these calamities can easily be realized. The Cabinet was reconstituted, the Grand Vizier Edhem Pasha making place for Hamdi Pasha. The efforts to obtain an armistice, begun through Mehemet Ali, were renewed through the Minister of War, Reouf Pasha, as nominal commander-in-chief, but were, as reports have it, momentarily checked by a declaration of the Grand Duke Nicholas that "there could be no question at present of an armistice without bases for peace." As to the terms of peace which might be acceptable to his brother the Emperor he could as yet give no indications; he was, however, ready to receive Turkish plenipotentiaries at Kazanlik. These were consequently appointed at a meeting of the Grand Council at Constantinople, Server Pasha, Minister of Foreign Affairs, and Namyk Pasha receiving the delicate mission. They were expected to meet the Grand Duke on the 16th.

THE KIND OF FINANCIAL LEADERSHIP THE REPUBLICAN PARTY HAS HAD.

SOME Indiana friends of the late Senator Morton have, in defence of his memory, taken the *Nation* to task with much severity and solemnity for having recently pointed out the evil influence of his career, since the war, on public morality. We were prevented by want of space from expressing ourselves on this point as fully as we desired, and prevented, for the same reason, from saying many things also touching the evil influence of such a career on the younger generation of politicians, most of whom in our time learn the trade of politics, and the proper mode of dealing with political questions, not from schools or colleges or books, but from the lives and examples of prominent public men. Indeed, it may be said that they learn the ethics of politics almost wholly by observing the effects of a politician's doings and sayings on his reputation and success; and argue, not unnaturally, that whatever a popular and influential man does or says with impunity cannot be very far wrong, if wrong at all, and may even furnish a useful object of imitation. A worse model for this class could hardly be found than Senator Morton's dealings with the national finances since 1867, or a more striking illustration of the extent to which some public men can divest themselves of a personal conscience and personal judgment, or of the way in which public opinion on a question like the public credit can be gradually debauched by the weakness and want of principle of men in high places. It is true, no doubt, that we owe a great deal of the prevailing dishonesty, both public and private, to the spirit of gambling bred by the ups and downs of paper money; but we owe much of it, also, to the unfaithfulness of leading Republican politicians—to their readiness, almost from the close of the war, not to check or discourage, but to stimulate and promote, every little tendency to dishonesty and chicane which the pressure of the burdens of the struggle, once its excitement was over, not unnaturally produced. We do not deny or forget the firmness with which many of them stood by the public credit, but we verily believe that we owe a large part of the dishonest frenzy which has been raging in the West, in one form or another, ever since 1869 to the eagerness with which others supplied suggestions, or excuses, or instruments of fraud.

It so happened that the acts authorizing the first loans contracted after the outbreak of the war in 1861, 1862, did not mention specifically in what kind of money the principal was to be repaid. The reason undoubtedly was that nobody ever thought of any kind of money but coin. No lender dreamed of their being paid in anything else. All the officers of the Government engaged in disposing of them represented them as so payable. The sale of them at par in greenbacks was merely a somewhat simple device of Mr. Chase's for concealing the full extent of the discount at which they were really disposed of, and in the then circumstances of the Government that discount—heavy as it was—was not unreasonable. In subsequent issues, however, in order to assure fully the moneyed mind in the presence of the growing volume of paper money and the rising premium on gold, payment in coin was specifically promised. In 1867, the knavishly disposed in searching for opportunities of fraud lighted on this distinction between the two issues of bonds, and joyfully maintained that the first ones were payable in paper. The point was not raised in any practical shape; the bonds were not due and the holders were not claiming payment, and the mere fact that the borrower was also the law-maker ought to have made the very suggestion of the Government's making a little money by sharp practice, under cover of one of its own statutes, odious and unmentionable. Nevertheless Senator Sherman not only raised the point, but made it an argument in favor of a Funding Bill offering the bondholders five instead of six per cent. without the option of being paid off. He took this ground in Congress, and here is what he wrote about it in a letter at the time, and in his language one can hardly fail to see the origin of the wild and dishonest abuse of the bondholders by which a great many of the ignorant and thoughtless people have been disgracing themselves and their country ever since:

"Your idea that we propose to repudiate or violate a promise when we offer to redeem the principal in legal tenders is erroneous. I think the bondholder violates his promise when he refuses to take the same kind of money he paid for his bonds. If so, the case is to be tested by law; if it is to be tested by Jay Cooke and his advertisements, I am wrong. I hate repudiation, or anything like it; but we ought not to be deterred from what is right for fear of undeserved epithets. If under the law as it stands the bondholder can demand only the kind of money he paid, then he is a repudiator and an extortioner to demand money more valuable than he gave."

Senator Morton was at that time the most influential man in the Republican party; in fact, it might almost be said that he was *the* party. He was still in favor of returning to specie payments by redeeming the greenbacks in coin, not having yet got over the earlier Republican idea that they were Government promises to repay a forced loan, and the following year (1868) he did bring in a bill providing for such return in 1871. But he none the less fell in with Senator Sherman's very heartily. He scouted the idea that the bondholders were entitled to coin. He put the Republican party in some sort of judicial capacity, made it the guardian of the national contract with the public creditor and bound to maintain the exact letter of the law, and "protested against its being committed to the dogma that the five-twenties were payable in coin." His views of the nature of judicial functions were, however, capable of great expansion when it suited him; for in 1868, in reply to the suggestion that the Supreme Court might declare the legal-tender quality of the greenbacks as to previous contracts unconstitutional, he asserted that "the Supreme Court should be something more than an expounder of statutes or collector of precedents, and should view such questions as statesmen as well as lawyers." This, he remarked, was what Lord Mansfield did. "In construing statutes, and in the settlement of great questions, he decided them in accordance with the progress of the times and the new conditions of society." He could not bear to have the Republican party imitate the Supreme Court or Lord Mansfield, however; if the letter of the law allowed it to cheat, cheat it must.

His talk on this subject, and that of Butler and others, began to injure the public credit, and seemed likely to make refunding at a lower rate of interest impossible. The "Bill to strengthen the Public Credit," by interpreting the public obligations as a statesman and not as a lawyer, by "construing the statute and settling a great question in accordance with the progress of the times and new conditions of society," which forbid a great people to play the sharper, was therefore introduced in February, 1869. Senator Morton opposed it, tooth and nail, at every stage. He said the bill was not "law." He "could not vote for it without proving false to his own convictions, and therefore would not vote for it."

"We should," he said, "do foul injustice to the people of the United States if after we had sold those bonds on an average of 60 cents on the dollar, we were now to make a new contract for the benefit of the holders. . . . The sole object of the bill was to raise the price of bonds in the market and put money in the pockets of the speculators. He predicted that, if the bill passed, all prospect of funding the debt at 4½ per cent. must be given up until we returned to specie payments,"

and so he went on denouncing it savagely. His idea evidently was that we could not refund at a lower rate of interest if we surrendered the means of threatening the public creditor with a fraud, and evidently was not thinking much of Lord Mansfield this time. In his speech one can find the germs of nearly all the later attacks on the public credit, and of the recent Western ravings about the silver bill. He voted against its final passage.

We have no space to follow his vagaries on the bill for redistributing the national-bank currency, which, foolish as it was, his comments made more foolish still; nor his diatribes against Mr. McCulloch's contracting power, which, if persisted in, would undoubtedly have prevented the panic of 1873, by checking the tendency to speculation. We must come down to December, 1873, when, fancying he saw "how the cat was jumping," he had got bravely

over his desire for specie payments. He was now a red-hot inflationist, and said "there was a sort of fanaticism about a return to specie payments; he had it pretty bad once himself, but experience and the lapse of time had abated it in his case very considerably. He recognized gold and silver as the standard to which we should return at some time or other" (they nearly all do), "but not until it was practicable to do so"; and he was opposed to making greenbacks equal in value to coin within a short time. He cited the financial history of England at considerable length to show that the proper cure for panics was inflation, and cited the case of Russia, Italy, Austria, France, and the United States to show that it was those countries which had an irredeemable currency which had made most progress during the previous ten years. When, however, Mr. Schurz began to ply him with financial history on the other side he threw off all restraint, and became absurd and unscrupulous beyond the belief of anybody who did not hear him, or has not followed him in the *Globe:*

"He put aside," he said, "old theories and commonplaces of the books, platitudes of finance and metaphysics of finance. They had no vitality in them. He preferred to take the actual results and the actual condition of the country, and let theory go to the dogs. . . . The demand for relief from the South and West ought not to be answered by old and barren theories, nor were we to be whistled down the wind and answered by theories from John Stuart Mill and Bastiat. He hoped not."

The meaning of all this, of course, was that instead of the theories of John Stuart Mill and others, deduced from careful observation of facts in other nations and ages, we were to take the theories Mr. Morton manufactured in such odd moments as he could spare from office-jobbing. In 1875 he was vigorously advocating resumption in coin.

We have reserved to the last the tidbit of his financial history. "If," said he, "you took a plaster-of-Paris cast of the continent of Europe, with all its mountains and plains and rivers, could you make it fit upon the continent of America? No more can you make a theory that may suit Germany fit the condition of things in the United States." We ought, perhaps, to stop here, but we must before closing remark that after this great "plaster-of Paris" argument he seemed to grow more reckless, and declared "we never were properly on a specie-paying basis in this country." "This theory of specie payments," he added, "is a sort of fanaticism; some people have it on the brain." Is it any wonder that a party which has had such financial gods as this should now be rent and torn by a passion for fraud and chicane, and that a considerable portion of it should be willing to sacrifice the national credit for the sweets of any bit of repudiation, however small?

ENGLISH AND GERMAN POLICY TOWARDS TURKEY.

THE rapidly-approaching close of the Turco-Russian war seems likely to leave England in that position of an object of detestation to both belligerents which now seems to be her fate in every conflict that occurs in Christendom, in spite of what she herself deems the most conscientious efforts to be neutral. There is little doubt that the Turks would never have set the Conference at defiance and have challenged Russia to the field if the Pashas had not believed firmly that, sooner or later, England would come to their aid. Although the English diplomatic papers have held out no hope of intervention, nearly every week some little thing has occurred—a movement of troops or of the fleet, or a ministerial speech, or a Tory meeting, or a "free fight" between Turkish and Russian sympathizers in the streets—to lead the Porte to believe that the interventionists were gaining ground and would soon have their way. The call of Parliament for to-day has been keeping up the spirits of the Turks to this moment in spite of their irretrievable disasters in the field, and the probabilities are that in four weeks more they will look on England as jointly responsible with Russia for their ruin, in spite of the good advice the English Cabinet has been all along giving them.

This usual and it must be confessed somewhat ludicrous result of English interest in foreign politics is, in a great degree, the fault of the press, which, owing to its freedom and its large capital and its enterprise as a news-gatherer, enjoys an influence on the Continent to which the press of no other country can lay any claim. It takes part, too, in foreign conflicts with a vehemence and bitterness which it is impossible for Frenchmen, Germans, or Turks to look upon as anything but an indication of an approaching participation of the nation itself in the war. During the late civil war in this country, for instance, the newspaper partisans of both North and South laid about them with a fervor which was in no degree surpassed by the press of this country. In fact, the intense hatred of the Tory writers for everything Federal was not outdone in expression by the Richmond editors, and to distant lookers-on, and especially to those not accustomed to the vagaries of free speech, must have seemed a sure sign that England would shortly take part in the fray. The same phenomena, in a somewhat milder form, were observable during the Franco-Prussian war, when the sympathies of "society" were again with the French, and the newspapers which represented its views gradually worked themselves up to the point of believing that the overthrow of France would tempt the bloodthirsty conqueror into an invasion of England, a chimera to which the *jeu d'esprit* called the "Battle of Dorking" owed its great success. At this moment the hatred of Russia has reached such a pass that the calmest and most cool-headed paper in England on all other subjects, the *Pall Mall Gazette*, appears on this to be the victim of a monomania, and one does not know at which to wonder most, its wild vilification of the Russians or its wild glorification of the Turks. That the Pashas can read it and some other papers without feeling that some serious step will shortly be taken by England is, of course, with their limited knowledge of the conditions of western society, almost impossible.

What makes all this the more remarkable is that, although it is well known that both Austria and Germany have a far heavier interest in the result of the war than England, and are in much closer proximity to its horrors, and have a much more serious appreciation of the gentle Turk, the public in both these countries has remained perfectly calm, and the Governments have refrained from all hints as to the nature of their policy or the direction of their sympathies. Indeed, the dignity and self-restraint with which Count Andrássy and Prince Bismarck have looked on at what was passing at their doors must present to Englishmen a mortifying contrast to the fussiness of their own Government, and the effect of this contrast must be aggravated by the reflection that either Andrássy or Bismarck could stop the war in a single week, while it is more than doubtful whether England could at any time since the crossing of the Danube have exerted any influence on it except by keeping up the spirits of the Turks; and yet the Turks seem to cast no blame on the Austrians or Germans. Indeed, it is only now—so well has Bismarck kept his counsel, and so calmly has Germany looked on—that real curiosity begins to be manifested about his policy, or that any trustworthy indications of it begin to leak out. Its vague outlines, however, are now becoming discernible, and if carried out he will have the honor of settling the last of the great European problems left untouched by the treaties of 1815; and probably in the way most conducive to all the great interests of civilization. The conjectures as to his aim which begin to find circulation and credit are, that he was only too glad to let Russia undertake the trouble and expense of putting an end to Turkey, and was determined from the first that she should not be interfered with; and how little importance he has attached to English restiveness has been illustrated by his latest and not least effective *mot*, "that if Turkey is a sick man, England is a sick woman." He means, probably, that Russia, having completed the job satisfactorily, shall get her compensation in Asia and in the freedom of the Dardanelles, and that the débris of the Turkish Empire in Europe shall furnish in some way or other, perhaps in the shape of an archducal viceroyalty, an excuse for pushing Austria a little further down to the southeast among the Slavs, and giving her a chance to build up an influence or make accessions of territory in that direction which will make her total separation from

Germany, when the time comes, easier and more acceptable. Indeed, it may now be almost said with certainty that he means that Austria shall do the main portion of the work of reorganizing European Turkey, and infusing political life into the populations which the peace will relieve from the Turkish yoke; and if this be really his plan, the skill and patience displayed in putting the cost of the enterprise on Russia can hardly be too much admired.

It is impossible to dwell on the calmness of the attitude of the other Powers on this Eastern Question, as compared to the English unrest, without asking whether what may be called the sporting view of foreign wars, which has now become so common in England —that is, the fierce sentimental interest in what Englishmen call "the weaker party," and the noisy desire that he should win, without reference to the goodness of his cause or the practical results of his victory—is not due in a great degree to the separation of the army from the body of the people. The smallness of the force and the mode of recruiting it make it seem rather like a champion hired to maintain the honor of the country than the nation itself in arms, and tempts the press and the clubs into the betting-men's way of looking at armed conflicts—that is, as if they were *spectacula*, rather than judgments in tremendous controversies delivered, as it were, amidst thunder and lightning. To a Continental statesman like Bismarck, to whom war means the calling of the whole people away from their industry to march through blood and fire, the sympathy of men like Disraeli for the Turks because they have fought well, or the notion current in London society that Russia is a cruel bully because she overwhelms a weak power with her big battalions, must seem extremely puerile. To him war is an instrument for great ends, and though bred in a military atmosphere, and the minister of an intensely military court, he has probably a far deeper sense of the solemnity of an appeal to arms than the Englishmen who, bred under the *habeas corpus* and the bill of rights, are thrilled by the desperation with which the Ottoman barbarians defend the soil which for so many ages they have drenched with the blood and tears of their victims. If the conscription should have the effect of giving English opinion a better comprehension both of the cost of war and of its gravity, and a deeper sense of the folly of regarding it as in any sense a prize-fight or mere trial of strength, worse things might befall the country than having to come to it; and this is a consideration which ought to go a good way in atoning for the heavy drafts which the enormous armaments of our day make on the material resources of the great states.

COLLEGIATE ORATORY.

THE competition in oratory between undergraduates of half a dozen colleges, which took place in this city on Thursday evening under the auspices of the Intercollegiate Association, and which we had an opportunity of witnessing, more than confirmed the doubts we have often expressed in these columns as to the expediency of encouraging displays of this character, and as to the unwholesomeness of their influence on mental training. One would expect, in the first place, if one-half of what the friends of college oratory tell us of its value were true, that students who cultivate and excel in it would exhibit some of the characteristics of a corps d'élite, and would furnish a flattering intellectual representation of their colleges, especially in an intercollegiate match. One was struck on Thursday evening, however, by the exceeding immaturity of the contestants. The choice of subjects was in itself a strong indication of a love of generalities and of a taste for hazy thinking, and sounding rather than exact expression, which properly belongs to the freshman or school period, and ought not to be found in company with beards, or be displayed on public occasions of this sort. No youth who had learned to think consecutively, and pursue subjects in his thought, would, for instance, care to discourse on the "Everlasting Man," or "The Ideal Man," or "Principle." These are topics on which one can talk by the hour and say nothing, and which a student with the right stuff in him would therefore naturally avoid. If the cultivation of oratory drives a young man in on such topics, it furnishes an argument of a very strong kind for avoiding it during the period of mental growth and discipline. The only way of escaping from these conclusions is by supposing that the best men of the various competing colleges do not enter the oratorical lists, and that the prizes there are sought by the fluent and histrionic rather than by the hard workers and strong thinkers; but this does not mend matters.

The choice of topics in some degree prepared one for the orations. They were as a rule well delivered, and bore traces of careful elocutionary training, as well as of considerable elocutionary capacity. The tones and gestures had been for the most part well studied, but so well that they made the subject-matter of the various discourses seem still more thin and commonplace. The fine manner seemed thrown away on the poor matter. Talma could not have struck better attitudes, or managed his voice better than some of the speakers; but it would have taken Cicero or Demosthenes to make the speeches worthy of the setting, and the speeches consisted mostly of commonplaces and platitudes taken in a loose way from the most accessible books, and poorly put together. Not one bore any trace of a careful preparation as regards facts or logic. One gentleman who dealt with a historical subject had not taken the trouble to bring his reading down to our own day, and the result was that his peroration was made up of a great and, under the circumstances, discreditable blunder. All the speeches, indeed, kept pretty clear of facts, and carefully avoided anything like a line of argument. None contained any sign of wide or accurate reading. One, which was perhaps the best delivered, was a kind of rhapsody worthy of Ossian. In fact, it is only by using the word oratory in the sense of "rhetoric"—that is, in its lowest and narrowest sense—that the contest could be called a contest in oratory at all, and it was difficult to avoid the conclusion that oratory cultivated in this way tended to mark a distinction between sound and sense, than which nothing in education is to be more carefully avoided.

It was somewhat interesting to observe the revelations made by the speeches as to the ideals cherished by the orators. The one on which, as was not unnatural, the admiration of nearly all was concentrated was the come-outer, the brave man who says strange things which afterwards come true, but is persecuted by his contemporaries for saying them, or who leads in some movement which looks hopeless in its beginning and brings ridicule on him, but turns out a great success in the end. This was all very well, but it would have been encouraging if there had been some signs of admiration also for the steady, faithful, persevering man, who does his duty in beaten paths. The mind of the orators evidently turned towards achievement through brilliant strokes or devious ways, rather than through silent and unobtrusive tenacity. But there was nothing more marked in the orations than the love of imagery and pictorial illustration, and in this they were a curious reminder of the speeches in the *Congressional Record*, a volume which few Americans look into, but which is full of interesting revelations of character and mental habits. In nothing more than in the use of illustrations is the difference between the real and the sham orator shown. With the former they simply furnish a means of lighting up his argument, or bringing the hearer's fancy to the aid of his attention; with the latter they constantly fill the place of arguments themselves. The one, for instance, will bring home to you vividly the changefulness there is even in the dark things of life, and the unreasonableness of despair, by pointing out that every cloud has a silver lining; the other will tell you to expect relief in your troubles *because* clouds are sure to pass away and the sun to shine again. Congressional orators frequently get over the difficult spots in their ratiocination in this way by resorting to images drawn from natural phenomena. And in no debates are they so apt to do this as in debates on finance. Again and again have the beneficial effects of inflation been proved by showing the fertilizing influence of water on a dry and barren plain. We have referred in another column to the late Senator Morton's argument that the financial experience of German men was of no use to American men, *because* you could not make a plaster cast of the surface of Europe fit the surface of the United States. The temptation to this abuse of imagery in such displays as the Intercollegiate contest is, of course, very great. The audience is very large, and could hardly be less critical, and is easier to hit with a trope or simile than with anything else; and it is therefore not surprising that the orators resort to whatever draws applause and seems likeliest to keep their friends from feeling bored. This, too, will account in part for the hero-worship of most of the speeches. A glowing eulogy on Lincoln, or Martin Luther, or William Tell can be brought in apropos of almost anything, and never fails to bring down the house.

At the bottom of all attempts of this sort to train young men to be orators, there is the radical error that writing a florid or bombastic essay on a subject with which one is imperfectly acquainted, learning it by

heart and repeating it in public, is oratory, or can lead to oratory in any proper or useful sense of the term. The great difficulty with all young men, as regards either speaking or writing, is rather that they do not know what to say than that they do not know how to say it. Almost every young man who takes to speaking or writing early is apt to be naturally fluent with tongue or pen. The kindest thing a friend or teacher can do for such a person is not to encourage him to take lessons in elocution and spout in public whatever comes easiest to him, but to train himself carefully in the mastery of subjects and the arrangement of arguments. The imagery and other ornamentation should come afterwards. To lay them on effectively needs taste and judgment, which do not always come naturally. It ought to be more discreditable to a young orator to be inaccurate, or ignorant, or slipshod as to his facts, or illogical as to his conclusions, than to break down in his delivery. If we ask any one who has made much effective use of his tongue in public, What is it that an orator most needs? he will tell us that it is to be able "to think on his legs," as the popular phrase is—that is, to have the full command of his faculties and of his materials or knowledge while actually addressing an audience. That this can be acquired by training, that it is an invaluable acquisition, and that in acquiring it all the mental powers may be strengthened, is known by a vast amount of experience. Now, to this such exhibitions as the Intercollegiate contest and commencement orations contribute nothing, absolutely nothing. The true training for such oratory as we need in our day and in this country is to be found in debate—that is, in the discussion of questions involving the answer on the spot of arguments there heard for the first time. To do this successfully needs careful preparation, full knowledge of the subject, and full command of this knowledge, and readiness and skill in arranging or drawing on it. It is this kind of training that would give our educated men their legitimate influence in shaping public opinion, and in elevating the public taste and controlling legislation. Far from cultivating this, however, one of the noblest and manliest of arts, our colleges, in so far as they have given any attention to the matter at all, have devoted themselves to encouraging the "demonstrative oratory" of the Greeks—that is, the repetition by heart of elaborate written essays—which was an agreeable and perhaps useful accomplishment in days when there were neither books nor newspapers, but a large population of lounging critics who were ready to listen to anything which wiled away the time, and to whom rhetoric was one of the fine arts, and language as delicate an instrument of expression as music. We cannot bring back those times if we would, and the more we try, or seem to try, to do it, the wider the gulf we create between the universities and the every-day life of the country (which is wide enough already), and the deeper we make popular distrust as to the value of university training. It was a curious and significant circumstance that not one of the subjects chosen by the young men who declaimed the other night at the Academy of Music, except one, had the smallest connection with the topics which are now agitating the world—the problems of trade, finance, religion, and war—which all civilized men are now pondering with fear and trembling. One gentleman spoke on the "Convictions of Labor," but as mystically and vaguely as if he were addressing the "Liberal Club," or as if "Labor" meant some sort of abstraction, and not men called laborers. As to the others, it seemed as if the themes which are now convulsing the world had never reached their ears, any more than if they had been bred in convents.

It is tolerably clear that the educated class in America is not likely to find in our time the entrance to official life any easier than it is now. Why it is, and whose fault it is, we do not propose to discuss here. Of the fact that our legislatures, both National and State, contain an increasingly small proportion of college-bred men we believe there is no question, and we would advise college-bred men to give up the hope of any such immediate change in the conditions of public life as will give them the official prominence in it they once held. But this, instead of furnishing a reason for neglecting public affairs altogether, furnishes a reason for seeking other channels of influence or power, and those channels undoubtedly are the platform and the press, and the oratorical training given at colleges should have this in view. We have had enough of "demonstrative oratory"; what we need now is men who can hold their own against all comers on the things of which all the world is thinking and by which the world is shaken; who are not afraid of a blatherskite, and who will not be willing to let him do all the talking on the questions of the day. There could hardly be a more striking illustration of the shortcomings of our colleges in this particular than the history of the pending silver movement. It is, all things considered, the boldest and most persistent assault which has been made on public and private faith since the foundation of the Government. It has elicited a prodigious amount of speaking and writing, and has revealed depths of folly, ignorance, and knavery which no lover of the country can see without alarm. And yet how many "educated men," properly so called, have taken part in the discussion it has caused? As far as our observation has gone, one might almost count them on the fingers of one hand. They have for the most part treated it as if it were a "politician's" question, and left it to the newspapers, and buried themselves in their books and private affairs, or, if they have spoken at all, have confined themselves to general and inoffensive observations on the advantages of virtue in the conduct of public business.

THE EUROPEAN SITUATION AFTER PLEVNA.

PARIS, December 28, 1877.

THE fall of Plevna has produced the greatest sensation here, even coming in the midst of a political crisis which engrossed the public attention. This great event has a military as much as a political importance. It can be well said that the art of war has been completely transformed by the use of arms which allow the infantry to fire very rapidly and at great distances. Many of the famous manœuvres which have rendered the name of Napoleon immortal, and gave him for a few years the domination of Europe, would now be quite impossible, and the great warrior would be obliged to change his strategy as well as his tactics. The use of the new arms was shown for the first time in your great American war; your generals discovered almost instinctively and under the pressure of necessity the laws of the new warfare. They found that war has become to a certain extent a question of arithmetic and geometry; that the bravest troops cannot advance against a long front of men who can fire rapidly, and who are protected by improvised intrenchments, or even by rifle-pits. The siege of Richmond became the most extraordinary illustration of the new rules of war: the besiegers had to defend themselves exactly in the same way as the besieged; redoubts were opposed to redoubts, trenches to trenches; the long coil of fortifications was drawn round Richmond; the courage was equal on both sides; each party was impregnable in its own intrenchments; in the end the besieged were obliged to capitulate.

So it happened again at Plevna. There are probably no better troops than the troops which were commanded by Osman Pasha—sober, hardy, obedient, imbued with the courage which is inspired by a strong religious faith; nevertheless, as soon as the road to Sophia was shut on Osman, as soon as the circle of rifle-pits and trenches was complete round Plevna, the defeat of the Turks became, so to speak, a question of time. Osman attacked the redoubts of the Russians on the last day, for the sake of his own honor and of the honor of his army; he probably had little hope to break through the lines which were defended by such a formidable fire. I have heard from an eye-witness an account of the attack on the lines at St. Privat, which were held by Marshal Canrobert before Metz. Canrobert had, so to speak, buried all his men in rifle-pits; when the Prussian guard advanced against his line a tremendous fire arose from the earth; the plain was swept by projectiles in rapid succession; in ten minutes six thousand men, the flower of the German host, were on the ground, the victims of a boldness which no longer finds application in the present system of warfare. The Germans succeeded in taking Metz, because Bazaine kept his army before it; he was shut in, hemmed in as Osman Pasha was at Plevna. The city fell with the army, while the destinies of the city and of the army might have been kept separate.

It seems as if the rule of numbers was invading war as well as politics; the new system of warfare requires immense armies, capable of enveloping any position, any army, opposed to it. The moral, individual qualities of the soldier seem to be becoming less important. Take the most stupid soldier, place him in a rifle-pit, give him an excellent gun and plenty of cartridges, suppose him to be an atom among thousands of other atoms equally destructive, and you can produce the most terrible effects with elements in themselves inferior. A Moltke, a Todleben, will play at war as we play at chess. Far be it from me to depreciate those moral qualities which, at a given time or given point, can still play a very important part. It seems to me, however, that war is becoming altered in its character, that it now requires cool strategists, able to move enormous masses of men. I say it with regret because these conditions seem to impose upon all the civilized nations of Europe the system of compulsory and universal military service; all the nations which take so much pride in their civilization must perforce become armed nations. England, isolated in her island, may perhaps escape this necessity, espe-

cially if she contrives to make in India a nursery of soldiers. Her army, in order to be very effective, need not be composed exclusively of British soldiers; it only requires English commanders and officers, English discipline and English arms. The military teachings of the present war between the Turks and the Russians throw a sort of gloom over the future of Europe. The friends of civilization cannot help being satisfied in seeing a race of conquerors who have been a curse to the finest parts of Europe fallen from their old glory, and threatened in Constantinople itself. And the Turks ought to be driven back to Asia Minor. New states would soon flourish in the valley of the Danube; Greece, assuming the proportions of a real state, would soon become an important empire; the Rumanians, who have shown real military qualities, might become agents of civilization in the west of Europe. But the satisfaction which can be felt at such prospects is diminished by the vision of a Europe which will be perforce in arms from one end to the other. Till the new equilibrium is found which must take the place of the old, till time has soothed the passions and angers which are now felt, the rising generations will all be taught the art of war, and enormous forces will be permanently wasted. The last word of civilization will be a state of perpetual (real or virtual) warfare. What, under these circumstances, will be the future of the few small states which are still in existence? What can be the chances of Belgium, of Holland, of Switzerland, of Denmark, in this great struggle for life of ardent, ambitious, and unscrupulous nationalities? "L'Europe, quelle est cette femme?" once said Forcade, in one of his luminous chronicles in the *Revue des Deux Mondes*. He was right; this Europe, known by the statesmen and the diplomatists of past times, no longer exists; and who can doubt that force will be a necessary agent of the transformation of the European states?

I have always believed in what is called the alliance of the three Emperors. At the time when it was the fashion to represent the Germanic and the Russian interests as necessarily hostile, I did not doubt that there was a complete understanding between the men who can direct the policy of Germany and the policy of Russia. At the time when Klaczko wrote his book, 'The Two Chancellors,' I did not believe that he would succeed in his effort to separate Germany and Russia. He there represented Russia as having been completely outwitted by Prince Bismarck, after having been his tool during the war of Sadowa and the French war; but Prince Bismarck, notwithstanding the great antipathy which is felt in Germany towards Russia, especially among the Liberals, notwithstanding the fidelity of many statesmen to the old Metternichian doctrines, entered into a close alliance with Russia, and did so with his usual frankness—a frankness the brutality of which is often as deceitful or more deceitful than duplicity. He drew Austria by a gentle compulsion into the alliance. I think that I am not much mistaken if I affirm that *all* was arranged more than two years ago, in the expectation of Russia's victory over Turkey, between Germany, Russia, and Austria-Hungary. Nothing was arranged in view of a possible defeat. Russia took *all* the risks on herself; if she had suffered an irreparable defeat, she would have been obliged to recross the Danube without any compensation for her great sacrifices. The alliance of Germany was only intended to guarantee to her the neutrality of the other European powers. In case of victory, however, I have reason to believe that something approaching a positive agreement has been prepared. There is nothing in common between Poland and Turkey; what has been prepared resembles, however, the famous partition of Poland. In this case the three allies will not make conquests, nor increase considerably their own possessions; new states will be formed which will be placed under the guarantee or protectorate of the allies. Even before the war broke out Prince Charles of Hohenzollern had made a convention with the Czar for the passage of the Russian armies; the Rumanians have fought bravely by the side of the Russians, and Bucharest is likely to become the capital of an important Danubian state, perhaps of a Danubian kingdom, which will cease to be under the nominal vassalage of the Commander of the Faithful. The conduct of Count Andrássy has taken by surprise the friends as well as the enemies of Austria. While the Magyars made demonstrations in favor of the Turks, the Slavs were not allowed to show their sympathies for Servia; there was no desire at Vienna to encourage the rebellion of a considerable body of Slavs. When the settlement of the Eastern question approaches, these apparent inconsistencies will be explained. Count Andrássy was in the secret of the Emperors; he calmed Hungary at a time when any movement of Austria-Hungary would have been injurious to the Russian projects. Austria-Hungary will have her reward, and I should be surprised if there was not in the Imperial family an Archduke all ready to do in Bosnia, Herzegovina, Servia, and even Bulgaria, what the Prince of Hohenzollern will have to do on the Lower Danube.

The offers of mediation which Turkey has made since her great defeat at Plevna have met and could meet with no success, since Eastern affairs have come to the point where human things, after long troubles and anxieties, can at last find their natural development and termination. I have read this morning a letter from St. Petersburg, written by a competent judge, describing the enthusiasm felt by the Russian people, and I noticed the words, "Our Czar will himself *dictate* the peace." The war will go on, and it is even said that the Czar is anxious to go now to Armenia. Who is going to stop the natural development of events? Who will rise and tell the Russians that they will not be allowed to press victory like a fruit full of juice? Who will oppose a contrary solution to the solution so long ago marked out by the Chancellors of Europe? Italy has placed herself completely in the orbit of the three powers. During the summer she sent Crispi, the President of the Chamber of Deputies, to Vienna and to Berlin. France is determined not to recommence a Crimean war, and whether her Minister of Foreign Affairs calls himself Decazes or Waddington her policy is so plain, so natural, that no power in Europe can hope to drag her for its own benefit from her isolation.

These mighty considerations cannot fail to impress themselves on the statesmen of England. Great Britain has, single-handed, done wonderful things; but a war against Russia, inflated by victory, satisfied with the sanctity of her cause, supported by the alliance of Germany, by the assent of all the minor powers of Europe, would be such a tremendous undertaking as even Lord Palmerston, if he was still alive, would hesitate before attempting. And what would now be the object of the war? Can the rule of the Turk be re-established in the provinces now occupied by enormous armies? can a British army retake Plevna? The war could only be concentrated around Constantinople. We might have a siege of Sebastopol reversed, but at the end of such a siege, whatever the result might be, the yoke of Turkey over the greater part of her Christian provinces would none the less be broken. England is hesitating; she asks herself whether she had not better give up the cause of Turkey as a lost cause and assure herself of some naval positions in order to increase the security of her commerce in the East, or whether it is still time, by prompt and decisive action, to save the remnants of the Treaty of Paris. It is never safe to prophesy what England may do; Baron Brunnow misled the Emperor Nicholas when he assured him that England would never go to war. England is prudent, she is cautious, she is intelligent, and can see the most distant consequences of a fact; but she is proud and passionate, and there are moments when all wisdom seems to her folly, and when all her prudence is lost in the instincts which are always dormant in her race. When Parliament meets on the 17th of January she will approach one of those moments which are the turning-points in the history of a nation.

Correspondence.

THE STABILITY OF THE GOLD STANDARD.

To the Editor of The Nation:

Sir: Will you have the kindness to enlighten some of your benighted Western readers by answering in your paper the following queries?

1st. Is there, or can there be in the nature of things, an absolutely invariable unit or measure of value, as a yard is a measure of length or a bushel of quantity?

2d. Is the value of gold irrevocably fixed by the cost of its production, or does it, like that of all other commodities, though being made by law the standard, and consequently remaining nominally the same, in reality constantly vary with the supply and demand?

3d. If a gold dollar is always and everywhere of the same value, really as well as in name, how can it pay at one time to transport it from New York to London and at another time back again?

4th. Supposing that it does really change in value, according to the supply and demand, how could the fact be ascertained and the variation measured while it is the only standard, and, of course, nominally the same?

T. P. Seeley, M.D.

Chicago, January 3, 1878.

[1. There is not, and there cannot be; because a measure of value measures desire as well as quantity. Gold is a commodity, and the object of desire as such, and for reasons arising out of its steadiness

of weight, its bulk, durability, and comparative cost of production, is a commodity through which it is convenient to exchange other commodities.

2. No, it is not; it varies partly with the cost of production, and partly with supply and demand.

3. The gold dollar is not always and everywhere of the same value, because the supply and demand are not always and everywhere the same. It pays to transport it from New York to London, and *vice versa*, when its value, owing to exceptional causes, at the one place is sufficiently greater than its value at the other to pay the cost of transportation and a small profit. This variation in value has been so often explained as to be one of the commonplaces of political economy. The favorite and most useful illustration of the process is that which supposes the world's supply of gold to be a central reservoir, from which the gold flows to those points at which the demand for it has risen and away from those at which the demand has fallen, and this ebb and flow goes on constantly, forming a sort of general tendency to equilibrium. Demand for gold is indicated by a fall in prices, or, in other words, by an increased readiness to sell, say in New York, after a panic. It then flows to New York from London until the supply in New York is such as to raise prices there and lower them in London, and it then flows back. In other words, it is constantly seeking its level, like water, all over the world. One advantage of using the same currency as other nations is, that we can, when short of money, draw on this central reservoir. In 1873, for instance, being out of monetary connection with Europe, the gold supply of Europe could do nothing to relieve the local pressure. When it came here it lay in the banks idle, greenbacks all the while bringing a heavy premium. The silver lunatics propose to continue this isolation.

4. The only way of finding out whether it has changed in value is by finding out whether its power of purchasing a number of other commodities, sufficiently large for safe generalization, has increased or diminished. To prove it, an examination of the silver-price of a variety of commodities in various commercial countries would be necessary.—Ed. Nation.]

GOVERNOR RICE'S MONARCHICAL CIVIL SERVICE.

To the Editor of The Nation:

Sir: It is greatly to be regretted that the Governor of Massachusetts should have announced himself on the side of Messrs. Conkling, Blaine, Butler, and Chandler in respect to civil-service reform. It is further to be regretted that he took advantage of his official communication to the Legislature for an announcement so contrary to all the latest utterances of the conventions and of the best public men of Massachusetts.

We say that we regret his action; we cannot say that we are surprised. With rectitude in his pecuniary relations to the world, with all the ordinary household virtues, and with excellent talents for administrative office, still it has never been thought or claimed that Governor Rice has in him any of that stuff of which heroes, martyrs, or reformers are made. His want of backbone, his almost morbid dread of unpopularity, are as well known in his State and as freely acknowledged as any fact in his history. He has been entrusted with a series of offices in spite of these defects, and because of the good qualities we have named.

The paragraph in which he treats of civil-service reform is carefully composed of strong and high-sounding generalities, but on everything practical it is a complete surrender. His quick eye for popular effects showed him how civil-service reform could be opposed with the most popular results, the least risk to himself, and leaving to himself the easiest opportunities for receding in case his reckoning of political probabilities should turn out mistaken. He is painfully impressed with the consideration that a permanent civil service, one in which the tenure shall be good behavior, however desirable, is monarchical! It is unsuited to a republic! The only civil service suited to republican institutions is such as we have been blessed with the last forty years.

"Much of the controversy on the subject has arisen out of the differing methods and politics employed or advocated to secure these results. It has sometimes appeared, to those who have given thought to the matter, that the partial failure which has hitherto attended the efforts to improve the civil service has come from mistaken arguments, which would, if successful, engraft upon our republican government the characteristic civil service of monarchies; and that many of the complaints made against the American system of civil service are, in reality, complaints against a republican form of government itself, through the system of civil service, which is a necessary part of that government. In a monarchy, authority in the civil service is represented in the crown; and schools of training may be maintained, and their graduates appointed to places in the various departments, with the certainty that, if found to be competent and faithful, they will remain there through life, or through the continuance of a dynasty. But a republic is a monarchy upside down."

"*The* American system," then, is the spoils system of the last forty years! And it is "a necessary part of that government"! A system of good-behavior tenure, irrespective of party voting and acting, for the lower offices, is the "characteristic civil service of monarchies"! And all this because "a republic is a monarchy upside down"! We supposed better things of a republic. We supposed it had a positive and distinct character of its own, and was not something else inverted, topsy-turvy, or lying on its side. If a republic is a monarchy upside down, we suppose a governor is a king standing on his head. Some people thought so at Philadelphia, in 1876, but we never sympathized with those envious speeches. We took pride in seeing the Governor of the great commonwealth surrounded by the most splendid retinue and gorgeous escort of them all.

It seems to us that His Excellency's description of a republic fits perfectly the present civil service. It is, if anything ever was, a despotism with the heels at the top and the brains at the bottom. Its rule has been despotic and personal, its motive-power spoils, and its tenure political personal servitude, unworthy of the free citizens of a republic.

Armies and navies have been characteristic of monarchies. No reader of history can forget that a regular army was opposed in England, on the accession of William III., upon the ground that it was unworthy of a constitutional monarchy—the characteristic tool of despotism; and the historical evidence to that position was insuperable. But Lord Somers and the wisest Liberals of that day had faith enough in the people and parliament of England to believe that they could maintain an army and navy with no danger to their liberties, and so it has turned out. Our Army and our Military Academy were attacked on the same grounds; and now, after the Mexican War and our civil war, an occasional demagogue is heard attempting the same cry, but in a feeble way, and with no acclaim in his support. The argument is equally good against the good-behavior tenure of the judges, which is the pride and bulwark of Governor Rice's State and of the republic, and it was used with too much effect by demagogues in times past, so that the corrected opinion of this day finds it difficult to restore that tenure where it has been lost. The change in the judiciary from one dependent on "the powers that be" to a tenure during good behavior is the greatest advance ever made in England toward freedom, good government, law, and order. The next was the emancipation of the vast body of inferior civil servants from the control, not of the Crown, but of the Cabinet and its leading supporters, and putting them upon a good-behavior tenure, irrespective of their votes, and freed from the personal servitude to party leaders. The English Liberals made this change, and the English Radicals are its devoted supporters. When Mr. Mundella, the Radical member from Sheffield, was in this country, observing our institutions with a keen and practical eye, he left us, in his speech at the Cooper Institute, a solemn warning against the effects of our present civil-service system. It was the most discouraging thing he had seen in America. He held up the independent good-behavior tenure of England as a system distinctly favorable to the independence and dignity of the people, and adverse to the despotism of one or of the few.

It taxes one's patience and good nature to criticise such talk as this, from whatever source it comes. But when it is used by intelligent men, whether from lack of virtue or of courage, to prop up a system which has disgraced and imperilled our republic in the eyes of republicans and liberals the world over, and furnish the advocates of despotism with their best arguments against us, we can only hope that the people will show more faith in themselves and their institutions than do their political advisers; that they will not sit down under the evil as a "necessary part of their government" because it is "a monarchy upside down," but will go forward in the belief that a republic can stand an independent tenure of its civil servants, subject to removal only for misconduct or incapacity, and no longer the trembling mendicants before the local party power, without danger of being turned into a monarchy standing on its feet. And we trust that our public men will not be scared by Governor Rice's insinuation, that all who support a reformed civil-service system are

secret enemies of a republic; and that he himself will be converted by seeing an unmistakable turn of the tide in its favor.

A Massachusetts Republican.

Boston, January 10.

PERSONAL FRIENDSHIPS AND PRESIDENTIAL APPOINTMENTS.

To the Editor of The Nation:

Sir: Your course towards President Hayes is eminently fair. I say this because I wrote you a note of criticism a year ago in another connection. But in a recent article you named various appointments made by him to which you took more or less exception. You named, however, Wm. Henry Smith, Collector of Chicago, as one instance of an appointment made upon the merits of the man. I happen to know a good deal about that. Mr. Smith *was worthy to be appointed upon his merits only;* but he is and has long been an intimate personal friend of Mr. Hayes, and rendered him very efficient service in the campaigns for the Governorship of Ohio. The point, however, is, Does civil-service reform require that a man eminently fitted for a position should fail of that position simply because he is a personal friend of the President?

Very truly yours, James H. Taylor.

Rome, N. Y., January 8, 1878.

[No, it does not, under ordinary circumstances, or rather would not were the civil service reformed. But when the fight against appointments through favoritism and influence is just beginning, and when the public has not yet been educated to believe in the possibility of anything else, or in the sincerity of those who advocate anything else, we think the President does the cause considerable injury by appointing men who, however good, are his personal friends, or have rendered him personal service, as long as anybody else equally well fitted for the place can readily be found. Such appointments give scandal, and shake the popular faith, and, in fact, are condemned by the argument which forbids the most upright judge to take presents from suitors.—Ed. Nation.]

TREATMENT OF COOLIES IN CUBA.

To the Editor of The Nation:

Sir: In your issue of October 18, speaking of the report of the Chinese Commissioners to Cuba, as recently republished in China, with illustrations, you say: "A few of the scenes we owe solely to the artist's imagination, like that in plate 39, . . . and probably in that in plate 36, where the sugar is being refined with men's bones."

I went with the commission to Cuba, and while there read and copied several hundred of the statements of their grievances which were made by the coolies to the Commission, and furnished the materials for a large part of the report. I also heard through the interpreters of the Commission much that was said by the coolies that was not committed to writing. Among the complaints made of ill treatment, in forms too varied and horrible to be easily imagined by any one who had not the opportunity to hear and see those most wretched men, none were more frequent and bitter than complaints about the disposition of the bodies of those who died—the leaving them unburied, throwing them into the sea, throwing them into pits, etc., and, along with the rest, the statement was again and again made to us that the bones of Chinamen were used for refining sugar. This was almost the first complaint that we heard, and it was repeated by scores of men. Whether Chinamen's bones, or any bones at all, are so used I do not know; but there is no doubt whatever in my mind that the coolies in Cuba generally believe that sugar there is refined in the way depicted by the artist. Probably the artist got his information from some of the servants or attachés of the Commission, unless, indeed, the few coolies who have from time to time returned to China may have circulated this story there. Henry T. Terry.

Tokio, Japan, November 25, 1877.

Notes.

Cassell, Petter & Galpin publish early next month a 'Dictionary of English Literature,' by W. Davenport Adams; a comprehensive guide to English authors and their works, and, if we may judge from the prospectus, a cross between Allibone, Vapereau, and Bartlett ('Familiar Quotations').——G. P. Putnam's Sons announce for immediate publication the following works not previously mentioned in these columns: 'Over Mental Work and Emotional Disturbance as Causes of Cerebral Congestion,' by Dr. Wm. A. Hammond; 'A Manual of Nursing,' by Dr. Victoria White, revised and edited by Dr. Mary Putnam-Jacobi; 'Canoeing in Kanuckia,' by Col. W. L. Norton and John Habberton, illustrated; 'Pottery,' by Geo. Ward Nichols; 'Handbook of Ceramic Art,' by M. S. Lockwood; a series of art manuals by Mrs. Robert Carter, principal of the Cooper Union School of Design, beginning with the 'Art of Sketching from Nature'; 'The Elective Franchise in the United States,' by D. C. McMillan; and 'Railroads and Railroad Questions,' by Charles Francis Adams, jr. The same house have begun issuing a series of "Economic Monographs," which already includes: 'Why we Trade and How we Trade,' and 'The Silver Question,' by David A. Wells—the former embracing part of Mr. Wells's controversy with "Merchant" in these columns; and 'The Tariff Question,' by Horace White. These monographs correspond very well with Von Holtzendorff's *Zeit- und Streit-Fragen* series.——Vol. xii. of 'Documents relating to the Colonial History of the State of New York,' just issued from the office of the Secretary of State, Albany, consists of documents pertaining to the Dutch and Swedish settlements on the Delaware River (1624–1682), translated and compiled by B. Fernow, keeper of the Historical Records. Mr. John Bigelow furnishes the introductory historical *aperçu*. It is a serious defect of the volume that the table of contents is not paged, and that there is no index.——A remarkable catalogue called "2,700 Personals," has been sent us by Charles L. Woodward, of 78 Nassau St. It is a condensed list, in alphabetical order, of funeral sermons, eulogies, biographical sketches, etc., generally so much in request and so hard to find.——Mr. Wm. Cushing, of the Harvard College Library, has indexed the *North American Review*, both for subjects and authors, down to 1878, and invites subscriptions to a bound volume at $2 50.——Professor Simon Newcomb has been elected a foreign member of the Royal Society of London, an honor hitherto enjoyed by Dr. Asa Gray alone among living Americans.——Prof. Tyndall's latest contribution to the Spontaneous Generation controversy—an account of his researches during his last summer's stay in the Alps—will appear in the *Popular Science Monthly* for February.

—Messrs. Porter & Coates write us from Philadelphia:

"We notice that in your review of Hullah's 'Music in the House,' in your number of 10th inst., you speak of it as being preferable to a dollar's worth of trashy sheet-music, thereby creating the impression in the reader's mind that the price of the book is $1. Will you please make some mention of the price of it in your next issue, as intending purchasers would then remit the correct amount (75 cents)?"

—We have received from B. Westermann & Co. the *Almanach de Gotha* for 1878. In its select portrait-gallery President Hayes figures among princes and princesses, and in the "Chronique" the United States, as usual, holds the first place, the Presidential struggle furnishing most of the incidents recorded. The novel features of the *Almanach* are few, but some are of considerable value. The census statistics of Germany and of Chili (1875) have been slightly corrected in accordance with the latest computations; the bare result of the French census of 1876, announced last November, is also given; and the American editor and statistician will find convenient our State and city censuses of 1875 which are here added in foot-notes. The comparative tables at the end of the volume are noteworthy in more than one particular. Thus, the issue of the Russo-Turkish war could not be better predicted than by the simple statement (p. 1027) that the army of Russia on a peace-footing is 787,998 strong, while that of Turkey is 157,667. For the first time the statistics as to the length of railroad lines have been supplemented by tables showing the number of persons transported and tons moved, absolutely and per kilometer; the gross receipts (total and respectively from passengers and freight), and the net proceeds after deducting costs of working. These have been prepared by Professor Stürmer. Still more valuable just now are Dr. Ad. Soetbeer's observations on the precious metals and on currency and banking systems, both European and American. Tables showing the production of gold and silver during the present century, in which the United States overtakes and surpasses Australia and Mexico; the relative value of the metal products, from which it appears that silver, which in the first decade (1801–10) was worth 77.3 per cent. of the total, was in 1871–5 worth only 42.8; the exportations to British India; the ratio of the two metals since 1830, the average of silver having fallen from 15.67 in 1831–40 to 17.79 in 1876; the mean price of silver at London for each month of 1875–77; the monetary reform in Germany;

the metallic reserve and note circulation of the Banks of England, France, Germany, and Austria ; and some German statistics of circulation and exchange. Dr. Soetbeer announces his intention to publish shortly an essay embracing the most salient data in regard to the economic history of the precious metals from the beginning of the sixteenth century to the present day. This work will be awaited with interest.

—The first number of the *American Naturalist* (vol. xii.) issued by its new publishers, McCalla & Staveley, Philadelphia, shows that in respect to its external appearance the change of management has not been for the better, and the contents are at least not superior to the average of former issues. What is more ominous, however, is the defection of scientists like Messrs. Alexander Agassiz and J. A. Allen, and Professors Gray, J. D. Whitney, Hagen, Shaler, J. D. Dana, Marsh, Verrill, Newberry, etc., who in a private circular withdraw the use of their names and support. Another, more special, scientific periodical, deserving a good word on the opening of its new volume (vol. iii.), is the quarterly *Bulletin* of the Nuttall Ornithological Club, Cambridge, Mass. We are glad to see that the conductors of this useful publication, which, by the way, is not an organ or in any way restricted except to ornithology, have been encouraged to enlarge it to forty-eight pages, with a proportionate increase in the subscription price to $2. A special feature of the present volume, says the prospectus, will be an exhaustive résumé of the current literature relating to North American ornithology. The January number is embellished with a colored lithographic representation of the *Passerculus bairdi*, and contains the first of a series of important articles on the first plumage in various species of North American birds, by William Brewster, and an excellent piece of criticism, by J. A. Allen, on Mr. A. R. Wallace's "Theory of Birds' Nests," which the reviewer finds wofully "inadequate." The *Bulletin* is printed at the University Press, and is altogether attractive. As both the *Naturalist* and the *Bulletin* appeal to general support, so a more than professional interest should be taken in the *American Architect* (Boston : J. R. Osgood & Co.), which entered upon its third volume with the issue of January 5. This weekly journal came full-grown into existence, and has been fortunate from the start in its editorial management. We do not remember to have read a number (and we have missed reading few) that did not contain some information for which every householder might be thankful. The discussions are mostly of a practical character, and calculated to diffuse sound ideas as to the nature of the architect's calling, his responsibilities, and the duty of clients to co-operate with him in behalf of honest building. The heliotype illustrations furnish some idea of the capacity of the architects who contribute drawings of their works ; or, when native material is scanty, represent well-chosen specimens of European architecture. In No. 106 Prof. Wm. R. Ware begins a series of papers on the difficult subject of perspective, to which we are safe in calling attention.

—The author of the article on "The Cosmogony of Paradise Lost" in *Harper's Magazine* for December writes us from London under date of December 28 :

"In the *Nation* of December 13, which I have just seen, I find that through a piece of culpable carelessness on my part I have incurred the charge of a deliberate plagiarism. I have no right to complain that the charge was made, and I simply desire to state that the offence was one of inadvertence and not of intent. The article in *Harper's Magazine* on 'The Cosmogony of Paradise Lost' was merely a condensation or adaptation of the Introduction to Professor Masson's edition of Milton. To attempt to palm off as my own a reproduction of the contents of so well known a book would have been no less foolish than unscrupulous. My article was one of a class very familiar to the compilers and readers of the monthly magazines, articles of which the material is taken directly and obviously from some book, either old or newly published, the original source receiving full credit. There is, of course, not the slightest objection on the point of morality to such reproductions, however unambitious they may be in a literary way. I have prepared very many of these condensations for newspapers and magazines, and have always given full and conspicuous credit to the original authorities. I failed to do so in the present case by one of those unreasonable lapses of attention which it may be easy to call improbable or incredible, but of which perhaps the experience of every man will supply an instance. As I was absent from the country when the article was printed, I did not see the proof-sheets and missed this opportunity of correcting my palpable oversight. I perhaps owe some apologies likewise to the editor of the magazine, for though I explained to him the character and source of the article, taking him Masson's book that he might have the diagrams reproduced, it was certainly my business to have been sure that the fact of the article's having been taken from Professor Masson's work was acknowledged."

—The *Sunday-School Times* (Philadelphia), of January 12, reproves the *Nation* for being "grieved at the increasing frequency of religious editorials in the secular press, especially at the Christmas season." As for the "queer pulpits" from which they are preached, it thinks nobody ought to object to a pickpocket's reading Luke's account of the Nativity to a bar-room audience ; and if this argument is calculated to disarm prejudice against Donn Piatt's "Sunday Meditations," for example, the following information seems to cut the remaining ground from under us :

"Most of the daily papers that print religious editorials are edited, like Thackeray's ideal journal, 'by gentlemen for gentlemen,' and are quite as worthy of a reputation for sincerity on the 25th of December as on any other day. Their graver articles are almost always prepared by the elder and more conscientious members of the staff, or, as is a frequent custom in city journals, by eminent clergymen outside the office."

That this, however, is not the view generally held by the religious press as to the origin of the "graver articles," appears from a recent remonstrance of the New York *Observer* (Religious Department). That journal insists that "the fact that many of the daily papers are engaged in discussing the doctrines of the churches is not to be looked upon favorably"; and again, that "it is not the province of the newspaper to discuss theological dogmas." The *Observer* would, we fancy, not have taken such strong ground if it had been familiar with the "frequent custom in city journals," or had suspected that it might really be censuring the work of "eminent clergymen outside the office." For a near neighbor of the *World* it is perhaps a little too unsuspecting.

—The latest European mails enable us both to correct and enlarge our necrological record of last week. The Danish poet, Christian Winther, died Dec. 30, 1876, and so by error was reported with the dead of 1877. M. Drouyn de Lhuys recovered "against almost all hopes." *Per contra*, Sweden lost Dec. 17, 1877, Johan Erik Rydqvist, the most eminent Scandinavian philologist of our time. In England, Dec. 23, died Thomas Wright, the indefatigable antiquary, author of the precious 'Dictionary of Obsolete and Provincial English,' of 'Narratives of Sorcery and Magic,' of a 'History of Caricature,' editor of the 'Political Ballads of the Commonwealth' and of numberless MSS. for various literary clubs and societies, translator of Napoleon's 'Life of Julius Cæsar,' etc., etc.—quite beyond our power to catalogue. He was of Quaker descent. The ingenious electrician, Henry Daniel Ruhmkorff, a Hanoverian by birth but a Frenchman by education, inventor of the "coil" which perpetuates his name ; and Taxile Delord, the conscientious historian of the Second Empire, also passed away in 1877. And it was Alexander Bain, the electrician, not the metaphysician, who died last year.

—The controversy over the trial of Galileo seems to have taken a new turn from the latest work on the subject. It will be remembered that the great astronomer was informed in 1616 that the Copernican doctrine was contrary to the Sacred Scriptures and not to be held or defended. In 1632 he published at Florence a Dialogue in which the above doctrine seemed to be upheld, and for which he was summoned to Rome by the Inquisition. He was accused of having obtained permission to print his Dialogue by concealing from the censor the fact that he had been expressly forbidden at the above date to make any utterance on the subject. Galileo replied that he had only given in his work the arguments in favor of the system, and that he had received no command on the subject, having been simply informed by Cardinal Bellarmin that the system of Copernicus could not be held as true or defended, and that he had not contravened this prohibition. A document was then produced by the Inquisition, which purported to be a report of the interview of Cardinal Bellarmin with Galileo on the 26th of February, 1616. It stated that the Cardinal, in the presence of the Commissary-General, admonished Galileo of the error of the above opinion, and warned him to relinquish it, and not to hold it *in any manner, or teach or defend it* by word or writing, otherwise the Inquisition would proceed against him ; which command Galileo accepted and promised to obey. This is the command that Galileo did not remember (in his examination he says the words above underscored, "*à me son giunte novissime, e come inaudite*"), and which Dr. Emil Wohlwill, in his book 'Der Inquisitionsprocess des Galileo Galilei' (Berlin, 1870), first pronounced a forgery. In the discussion which thereupon arose the value of the above document was variously estimated, one side declaring that it was forged in order to obtain a condemnation not otherwise possible, the other side upholding the authenticity of the report, and asserting that Galileo could have been legally condemned without it on the strength of what he admitted that Cardinal Bellarmin really told him.

—Of course, in order to settle the question definitively, a careful examination of the original papers was necessary, and their complete publication desirable. The fate of the volume containing the papers concerning

Galileo's trial is well known. It was carried to Paris by the first Napoleon, and restored by Louis Philippe on condition that it should be published, a condition only partly and incorrectly fulfilled by the publication of Mgr. Marino Marini's 'Galileo e l'Inquisizione" (Rome, 1850). In 1867 L'Epinois published in the *Revue des Questions Historiques* a partial and incorrect copy of the Vatican MS. In 1876 Prof. Domenico Berti published a copy of the MS. which he declared complete and correct, and, forgetful of the labors of L'Epinois, "edited for the first time," 'Il Processo originale di Galileo Galilei, pubblicato per la prima volta' (Rome, 1876). Berti's work was not well done, for he omitted five entire documents, and gave the contents but briefly of more than fifty others. Besides this, the order of the documents differs from that of the original, and the editor modernizes the spelling and punctuation in a most unwarrantable manner. In the same year appeared Karl von Gebler's interesting work, 'Galileo Galilei und die römische Curie' (Stuttgart, 1876). The author gave a life of Galileo and a detailed account of his conflicts with the Inquisition, declared the document of February 26, 1616, a forgery and supported his belief by cogent arguments. Berti, who upheld the authenticity of this document, replied that Von Gebler had never seen the original papers and could not pronounce on the falseness of one of the documents. Von Gebler thereupon went to Rome, and the result of his labors is a second volume of his work, entitled 'Die Acten des Galilei'schen Processes, nach der Vaticanischen Handschrift' (Stuttgart, 1877). In the introduction the editor confesses that he was mistaken, and that the famous document must be authentic. It is written in the same hand and ink as other papers of the same date, and on the same leaf with a document of the day before. Von Gebler shows that this leaf could not have been inserted later. The question then arises whether the report of Feb. 26 is a true report of what took place. This the author denies, and the whole matter is practically left where it was before. Von Gebler then gives a reprint of the entire Vatican MS. with the utmost bibliographic correctness, indicating the length of the lines and pages, the direction of the endorsements on papers, etc.; and the student has now for the first time all the materials for an independent examination of the question. While Von Gebler was pursuing his labors in the Vatican, L'Epinois was there engaged in the same task (unknown, however, to the former), and shortly after published 'Les Pièces du Procès de Galilée' (Paris, 1877). This editor has also given a complete and careful copy of the MS., with photographic copies of the most interesting papers, among them, of course, the reports of Feb. 25 and 26, 1616. Although the controversy is as far as ever from being settled, we have at least gained these complete and accurate transcripts of the record of one of the most interesting ecclesiastical trials in the history of the Romish Church. An able review of the question in its latest phase was begun by Dr. Scartazzini in the *Rivista Europea* for December 1.

EGYPT.*

WHAT Peter the Great was to Russia, Mehemet Ali was to Egypt. The one created an unchecked absolutism by destroying the Strelitzes, the other by exterminating the Mamelukes. Each formed an army on the European model with the help of foreign adventurers; Solyman Bey was Mehemet Ali's Lefort. Each violently modernized his country, vastly expanded its limits and power, and, so to say, introduced it into the Occidental concert of nations. Both were unbridled despots, intensely ambitious, crafty, and, when needed, cruel. Each achieved more by revolutionary reform than by arms, although both were conquerors. The innovations of both, though thoroughly unnational, have succeeded in radically changing the forms of government and administration.

But here the parallel ends. The reforms of Peter were imposed upon a large, independent, homogeneous, sturdy, and comparatively young nation of northerners; those of Mehemet Ali upon an exhausted and ground-down population of mixed race, occupying a sub-tropical dependency of a tottering empire, and bound by religious allegiance to the master of its master. The conquests of Peter extended the limits of Muscovy in the direction of more civilized nations, as well as in that of the decaying East; of the conquests of Mehemet Ali only those remained permanent which enlarged Egypt with domains of tropical and almost equatorial barbarism. Peter became the ruler of a power able to cope not only with its feebler neighbors, Sweden, Poland, Turkey, and Persia, but also with the mightiest of nations; Mehemet Ali conquered all his neighbors, Wahabees, Nubians, and Turks, but naturally succumbed to the intervention of the great European Powers. The empire left by the former was destined to grow by its collisions with the surrounding states, almost all then on the decline; the semi-independent state created by the latter was doomed, by its position on the road to India, to fall under the more or less pronounced protectorate of a great maritime power.

In one respect the comparison is unfair. We compare the Egypt of to-day with Russia as we know her, while we ought to compare her with Russia under the fourth successor of Peter. Egypt, under Mehemet Ali's fourth successor, is more surprisingly, and perhaps more beneficently, transformed than Russia was then. In any case, whether Egypt is destined to realize the dream of a great new Arabic empire or not, she presents one of the most curious phenomena in the history of our century, and a plain and unadorned picture of her present condition, such as Mr. McCoan's is, is a welcome addition to our ethnographical and statistical stock of knowledge. That writer is far from being devoid of ancient or modern Oriental lore, and might easily have rendered his pages more attractive by sketches tinged with Eastern glow or with reflections of Pharaonic hues, but he has preferred giving us a strictly matter-of-fact account of the realm of the Khedive as it is, mainly considered as a government. We are glad of his choice. He has seen fit, also, to leave out of his picture the social life of the country, for the reason that he considers "the vivid portraiture of the manners and customs of both Arab and Copt" drawn by Mr. Lane in his 'Modern Egyptians' to be "as true still as it was forty years ago." We will follow the author in his observations.

The part of Africa ruled by Ismail, the son of Ibrahim Pasha and grandson of Mehemet Ali, extends from the Mediterranean to near the equator—its southern limit "may for the present be fixed at Gondokoro (lat. 4° 55′ N.)"—and from the Red Sea and the Indian Ocean to beyond Darfoor, measuring more than eighteen hundred (not "1,600") miles from north to south, with an average breadth of about three hundred and fifty miles. But the Egypt of politics and trade, to which our author limits his pages, is still the Egypt of the Pharaohs and Ptolemies, mainly consisting of the Delta and the narrow valley of the Nile up to the first cataract, in lat. 24° 5′. Of this country only about eleven thousand square miles are watered by the river, of which less than two-thirds—4,625,000 acres—is actually under tillage. The total cultivable surface of the annexed territories—Nubia and the Soodan—is roughly estimated at 150,000 square miles. The population of Egypt proper, compared to the cultivable area, is denser than that of any state in Europe, not excluding Belgium, numbering "rather over than under 5,500,000"; that of the annexed provinces, on a mean of the conjectures of various travellers, is vaguely estimated at 10,000,000 or 11,000,000.

The component elements of the population of Egypt proper are thus approximately computed: Settled Arabs (fellahs), 4,500,000; Bedouins, 300,000; Turks, 10,000; Copts, 500,000; Abyssinians, 3,000; Nubians and Soodanees (mostly slaves), 40,000; Jews, 20,000; Rayah Greeks, 20,000; Syrians, 7,000; Armenians, 10,000; various foreigners, 90,000. Of the main element, the Arabian, only one-third is considered to be of purely Semitic descent, and the bulk as descendants of the Copts who embraced Islam immediately or at various periods after the Arab conquest. The fellahs are a fine race, muscular and tall. "The agriculture of the country is mainly in the hands of the Moslem fellaheen, its accounts-keeping in those of the Copts; the Turks are for the most part proprietors and officials, the Negroes domestic servants, and the Levantines and Europeans, in their multitudinous varieties, traders, shopkeepers, and dealers in money." The natural increase of the population is considerable, having risen from the annual number of 33,000 during the ten years ending 1861 to nearly 47,000 in 1862–6, and to 63,000 in 1867–71, and thus, if continued at the last rate, promising the doubling of the population in less than sixty years.

The Arabic element, fostered by religious influences, gives to Egypt its national character, which is still preserved not only in the rural districts but in Cairo and almost all other towns, the showy and noisy appearance of the European and Levantine admixtures notwithstanding. And yet, how unlike in appearance is the urban Egypt of to-day to the urban Egypt of the Caliphs or Mamelukes? Here is Alexandria—the St. Petersburg of the Khedive—glorying in "dockyards and arsenals, steam-engines and steamships, mills, factories, railways, and electric telegraphs," and there Cairo—his Moscow—with its hotels and blocks of European shops and dwellings, its opera-house and French comic theatre, its "Greek and German *brasseries* and musical *cafés*," and its "new Khedive Club, founded on the model of our best London institutions, under the patronage of the heir apparent," and its balls and concerts at the palace

* 'Egypt as It Is. By J. C. McCoan. With a Map, taken from the most recent survey.' New York: Henry Holt & Co. 1877. 8vo, pp. 417.

during the winter, which "bring together the official, financial, and commercial *élite* of both Cairo and Alexandria."

The aspiration of Egypt is to become an Arabic power, distinct from Turkey in nationality, and our author entertains no doubt that were the Khedive, now a viceroy whose dignity is secured by solemn stipulations to his descendants in a direct line of succession, to declare his entire independence to-morrow, he would be supported by all classes of the Egyptian people. He now pays a tribute of £685,308 to the Sultan, is bound to give him military aid against his enemies, and has no representation abroad; in every other respect he is the sovereign of Egypt, its absolute ruler. He negotiates treaties, raises armies, carries on war, imposes taxes, and issues decrees, untrammelled by a veto of the suzerain or a vote of the people. An Assembly of Delegates, consisting of village sheikhs and other provincial notables, is convened, it is true, every year, to receive a report on the administration, and consider all proposed fiscal changes, and other matters laid before it; but its function is, at the best, advisory, without any legislative power. But while considering the Khedive as his king, the Moslem Egyptian is also bound by religious ties to the Sultan as his Caliph, and "in any struggle involving positive peril to *Islam*—not merely political danger to the Porte—the Arab would infallibly make common cause with the Turk."

The higher administration is completely fashioned on European models, including a Privy Council, a Cabinet of eight ministers, and numerous bureaus; but, in reality, "l'état c'est le Khédive." He both reigns and governs, and the highest dignitaries are merely the tools of his will. Mr. McCoan's picture of him smacks of panegyric. According to him the Khedive is the reverse of a modern Sardanapalus, which a "common fallacy" makes him to be; he is as a ruler a kind of Frederic the Great, "seeing everything, knowing everything, and ordering everything for himself," almost without interruption or rest. Unfortunately, however, he inherited from his predecessor not a model army and an overflowing treasury, as the restlessly active Prussian did, but resources drained in every respect, and the costly enterprise of the Suèz Canal, which, with other public and private enterprises of a dazzling character, with blackmail to Stambul, and extortionate interest on loans added to loans, gradually plunged Egypt into the vortex of financial ruin, and finally, in November, 1876, placed her resources under foreign revenue controllers, and subjected her to international tribunals. The period of financial and economical misrule which then ended with the fall of the minister of finance, Ismail Sadyk, is acknowledged by our author to have been one of unparalleled extortion and corruption, though he endeavors to whitewash the all-seeing and all-ordering prince.

The financial condition of the country is thus epitomized: "In 1835 the revenue was estimated at £2,600,000, and the expenditure at about £2,300,000, without any public debt whatever. In 1862, the last year of Saïd Pasha's reign, the figures had risen respectively to £4,929,000 and £4,330,000, with a debt of £3,292,300; while last year's budget claimed an income of £10,772,611, against an outlay (exclusive of interest on the floating debt) of £8,981,852, with a total state debt since fixed by the Göschen-Joubert scheme at £76,000,000." As settled by the decree of November 18, 1876, the debt now roundly amounts to £80,393,000, on most of which the interest is 7 per cent. In regard to taxation the strain "has reached a point beyond which, for some years at least to come, it cannot be safely carried." The general corruption prevailing among officials, extensive smuggling and other customs frauds, and exemptions enjoyed by foreign residents under special capitulations, deprive the Government of much income, direct and indirect. The civil list of the Khedive, including grants to the heir apparent and his two brothers, and the numerous families of the preceding viceroys, amounts to £560,000 annually, which, Mr. McCoan says, "cannot be considered excessive." An army of about 30,000 and a very poor navy consume about £900,000 a year. Economy is yet to be established, and faithful official energy to be charmed into existence. Yet trade is sound, manufacturing industry growing, and the aggregate of railway lines large—1,100 miles; and the country is also rich in harbors, docks, canals, telegraphs, and, for an Eastern land, in schools, museums, and other useful institutions, in great part creations of the reigning Khedive. Security reigns not only in the valley of the Nile, but in the adjoining abodes of the nomads. The stick of the tax-gatherer, for the use of which we hear some pleading, is less cruelly employed than formerly, and the *corvée* tax greatly reduced.

We receive also an extenuating picture of slavery as it still exists in Egypt. In both Turkey and Egypt, we are told, the condition of the slave differs "*toto cœlo* from that of the old Roman *servus* and the modern West Indian and American negro. . . . In the Levant he is simply an unwaged in-door servant, whom both law and religion protect from ill-treatment, and who, as a rule, is not only as kindly used as ordinary domestics in Europe, but enjoys over them not a few advantages." In Egypt, especially, he is "rather the dependent than the slave of his owner, who treats him—far more than free servants—as a member of the family, and in cases innumerable gives him his freedom after a few years, and starts him on his way to any fortune." Ill-treatment by masters is strictly guarded against by enactments of great humanity, partly based on the teachings of the Koran, and partly inspired by a desire of emulating Occidental progress. The importation of white slaves, male or female, has declined to a very low point. "The harem market is now chiefly supplied with Abyssinians," Circassian girls being too expensive and Arab girls entering the harem only as wives. The now prevailing fashion, even among the upper classes, is to have only one wife—that is to say, one legally married. The education of the female sex, the first foundations of which have been laid, promises to exercise a considerable influence upon social conditions, even in this part of "the unchanging East." The chapters treating of both slavery and public instruction belong to the most interesting in the book. Another highly interesting chapter is devoted to the "Daïras," or administrations of the vast estates of the Viceregal family, including the great sugar-factories and rum-distilleries in the Upper Valley and the Fayoom; and agriculture, commerce, manufacturing industry, the Suez Canal, the Soodan, etc., are all amply treated. But want of space prevents us from further following our author.

CHINESE CURRENCY.*

THE chief modern authority on which we have hitherto been obliged to rely in regard to Chinese paper money consists of some articles by Biot in the *Journal Asiatique* for 1837. The work now before us rests upon the same Chinese authority used by Biot, the history of Ma-twan-lin, but Mr. Vissering has subjected the original to more thorough examination, and with far greater advantages. His book is a study in Chinese and in the history of money. We propose to give a summary of the most important facts under the latter head which his book contains.

There are indications of an ancient currency of shells or beads in China, which were used for ornament in embroidery or a kind of jewelry, like the wampum of the American Indians. This was succeeded by a currency of cloth (apparently in units of a dress pattern) and knives as standards in barter, like beaver-skins among the Indians. The introduction of metallic money falls in the third thousand years before Christ. The forms in which it was first coined (by casting) appear to have been imitated from the barter currency last mentioned. Some coins are in the shape of garments and some in the shape of knives. Yellow, white, and red metals were used. Round coins, with a square hole in the middle, were introduced 1022 B.C. Cast coins of this shape represent the highest development of the art of coinage ever reached by the Chinese. Gold went out of use for money about the commencement of our era, and silver was not coined, although references to it as a monetary material occur. The supply of gold and silver in China was small, and its value high, while the cost of living for a man of the lower class was one cash per day. One thousand cash (small copper coins) were worth one tael of silver (1½ oz.), so that one cash was about 1½ mills of our money. Silver was to gold as 10 to 1. Hence coins of gold or silver were not convenient.

Several concurrent traditions narrate that money was first coined by the common people in times of calamity. This seems to mean that all lived ordinarily by agriculture and exchanged by barter, but when the crops failed they took to mining copper, which they cast into coins for convenience in exchanging it for goods. It was first used for the general purposes of money by merchants. The historian mentions the development of trade and industry by the use of money only to lament it. He quotes one Lao-tsze, a philosopher who has some followers now, as follows: "The highest state of perfection of good government is reached when the people think their food sweet and their clothes beautiful; when they rejoice in their uneducated simplicity; when the inhabitants of neighboring states, who are so near each other that they can see one another, and hear the crying and barking of their fowls and dogs, have grown old and die without having had mutual intercourse."

In the year 119 B.C. white deer-skins were used as a sort of currency for levying forced loans on the grandees of the court. There is in connection with this an obscure reference to some similar token-currency as

* 'On Chinese Currency, Coin, and Paper Money. By W. Vissering, LL.D.' Leyden: E. J. Brill. 1877.

having been used long before. These bits of white deer-skin were conferred on the nobles as marks of honor at an arbitrary price. At about the same time coins of a mixture of tin and silver were issued at an arbitrary rating. There were three sizes, in weight as 4, 6, and 8, but they were rated in value as 300, 500, and 3,000. They were counterfeited both by officials and people. In 117 B.C. the money was restored to its real value.

About the commencement of our era a usurper restored the knife-shaped coins under two forms, one of which bore gilded symbols and was rated at 50 cash, the other at 500. By picking out the gilding the lower might be raised to the higher. This ruler introduced in all twenty-eight sorts of currency, of five substances—gold, silver, copper, tortoise-shell, and other shells. The confusion and misery which ensued led to his assassination.

During the division of the empire the abuses of money went on. In 465 A.D. a deposed emperor coined very thin light coins, which were at once counterfeited. As soon as the money was depreciated the most lucrative occupation was "making money." These coins were called "weed-leaves." One thousand coins piled together were only three inches high. Some were as thin as a thread. A statesman of this period declared that the reason why the stringent laws did not prevent false coining was that the Government itself did not make its coins of full weight. He taught that "money is an instrument in daily use to further exchange." In the Northern Empire the depreciation was such that a pound of copper could be bought for 81 cash, and 200 cash-pieces could be made from it by the false coiners. It was provided that a string of 100 cash of standard weight should be hung over the gate of the market, and in lodging-houses and shops.

In 622 a reform of the coins was brought about, but not enough were supplied. The false coiners, therefore, still kept at work. The good coins were hoarded or melted. Forty years later the good money was abolished. A decree of 734 introduced barter, apparently in despair of the coinage problem. In 758 coins were cast of the legal weight, but arbitrarily rated. Prices rose enormously, and hundreds died on the roads from want. Recourse was had to stones for grinding rice, which had a fixed value, as money. By the abuse of money the nation had robbed itself of money. It lost all the advantages of money, and had to return to barter. It could not support the population which had been produced under the advantages of the money system.

At the end of the eighth century we find the first mention of paper money of any form. It consisted of certificates of deposit called "flying money," issued for coin deposited by merchants to avoid the risk and trouble of carrying the heavy coins in use. It was soon abolished—we are not informed for what reason. In 809 it was proposed to reintroduce flying money, and to issue it either for money or merchandise deposited, charging a premium on the notes of 100 cash on every 1,000 string (string of 1,000 cash ?). None accepted this invitation, and the premium was abolished. The paper, however, did not yet come into use.

In 817 a decree fixed the amount of coin which any one might possess at 5,000 string, and ordered anything over this amount possessed by any one to be expended within a month. Next it was forbidden to use copper in ornamenting Buddha images, or for any but a few specified implements in the temple. Then it was proposed to confiscate the copper in the temples. "Intestine division and anarchy increase more and more," and there is a gap of forty years in the history. "Within the period of 53 years (907–960) there reigned five different imperial families. In these times of commotion and bloodshed the monetary history is confined to the abolishment of the existing [regulations] and the introduction of all sorts of restrictive measures."

At the end of the tenth century iron coins were introduced, and the former troubles were enhanced by those of a double standard. The legal ratio is given as 10 of copper to 1 of iron, but the coins were cast in the ratio of 12 to 5 gross weight, or 3½ to 1, pure contents. Other coins give a ratio of 5 to 1. The only reason assigned for these variations is that the iron coins, if of the weight which value required, were inconveniently heavy. The value of either metal was so slight and variable that a constant ratio could not be established. There was considerable exportation of coin, but it was not free and active enough to work out the effect of incorrect rating in that way. The false coiners effected the same result. They coined the cheaper metal and exchanged coins of it at a profit of from 100 to 200 per cent. There came to be in use (1) large copper coins with a weight of 3, and a nominal value of 10, small copper coins; (2) small copper coins at a premium in iron; (3) small iron coins of no constant value. A reformer arose who proposed a coin of six parts iron and three parts copper. "He was convinced" that this would overcome the difficulty. The iron, however, was found too hard to work, and the values were not properly adjusted, so this scheme was abandoned. The false coiners only varied their industry by making the large copper coins, which, at the above rating, offered them even greater profits than iron coins. By rating the small copper coins at two iron coins each, and correcting the rating of the large copper coins, the false coining was stopped, but other evils remained, for the iron coins had only half the value in bullion which they had as coins. In the end iron coins were restricted to some provinces, and copper coins to others.

At the end of the eleventh century a plan of advances of capital to poor men, to enable them to cultivate the fields, was tried. Through the dishonesty of officials the interest and the repayments were not collected by the Government, "distress and impoverishment taking the place of the expected advantages to the people, while, on the part of the state, vast sums were irrecoverably lost."

In 960 paper money appears again. In the Western provinces it was issued by a bank or syndicate of wealthy families against a deposit of coin. The Government, adopting the plan, opened offices in the treasury at the capital, at one of which deposits might be made and at the other notes obtained. A premium of two per cent. was charged for the latter. These notes were like warehouse receipts, and were issued for merchandise as well as for money. In 1011 bills of exchange were first issued. They soon displaced the former notes. Conversion on demand was never provided for. The bills were drawn for a term of sixty-five years, and every three years there was to be an opportunity for demanding their redemption in specie. The "basis" deposited when the first issue was made was three-sevenths of its amount. At first the issue was strictly limited in amount. It is easy to see what great advantages these notes offered. At the prescribed periods few demands for redemption were made. The reserve fund was therefore neglected, and finally used for other purposes. In 1076, when the term expired, the notes could not be redeemed; but in anticipation of this a new issue had been made in 1072, for twenty-five terms of redemption of three years each. The old issue was "redeemed" with these, if at all. In 1107 the bills of exchange of one province were changed into irredeemable bills of credit. The circulation of bills was now twenty times what it had been in 1023, and their value had depreciated. Few had been redeemed. Notes of the new issue were worth one for four of the old. The "bank for the issue of bills of exchange" was now changed into the "bank for the issue of bills of credit," and a new issue was made for forty-three terms of one year each, to bring the two former issues to a round sum. A magistrate's report shows that a depreciation existed by which a note issued for 1,000 cash was worth 100; soon after it was only worth 10. To force a circulation of the bills the Government decided to pay out only bills, or, if it paid out cash, to deduct one or two tenths.

About 1125–7 the Tartars invaded the Empire. To keep up the war against them unlimited paper issues were made, and every expedient was tried to give them circulation. Some were issued bearing the name of gold and silver weights, and promising payment in those metals after the war. In 1131 two new forms of paper were issued. One was "frontier-notes," with which to buy supplies for the army. These seem to have been orders on the custom-houses for cash collected by them. They were redeemed also in receipts for Government products, which, in turn, were redeemable at the Government stores by the merchandise specified. These notes had three years to run. In the second year a man might pay half his taxes in these notes. Another kind of paper is called bonds, issued nominally for deposits of money or goods, but, as it seems, nothing but bills of credit. These were multiplied in vast issues, and seem to have become the prevailing form. In 1166 they were exchanged for other notes at 10 on the 100. Then followed tyrannical decrees about exchanging and rating, accepting and refusing, and redeeming and deferring, the notes, too numerous to mention. In 1209 the bonds had been issued in such quantities that they did not perform the functions of money at all. New notes were printed on paper mixed with satin and saturated with olibanum, and issued at one for two of the old. Confidence was now entirely destroyed, and the inquisitorial proceedings of the Government, encouraging accusations and denunciations, spread distrust and terror throughout the community.

Paper money had long been used in the western provinces as well as in the central provinces, whose history we have followed. In 1210, after the old bills of the western provinces had been twice withdrawn, they were equal to the new ones. The Tartars had also borrowed the invention, and, last of all, it had been introduced into the eastern provinces.

The consequence was that in the thirteenth century the whole empire was overwhelmed by the mischiefs which it produced, amounting to anarchy and almost a dissolution of society. Adjectives seem vague and feeble when used to describe such a state of things. Vissering thus sums up the picture as presented by the Chinese historians: "Provisions rise in price, trade is paralyzed, weeds cover the fertile fields, false coiners spring up like clouds, the officials practise extortion on the people, the posterity of those who were born in affluence die miserably from want, and the bodies of tens of thousands, not killed by the sword of the enemy but starved with hunger, cover all the roads of the empire." He also gives the following summary of the work of Wang-ki, the continuer of Ma-twan-lin: "One issue succeeded another. New names were invented to delude the people. Solemn promises were made that henceforth the Government would fulfil what it had charged itself with. The result was that again and again old debts were paid by incurring new in order to defer the impending bankruptcy of the state."

In 1260 China was conquered by Genghis Khan. The Mongols, however, continued to use paper money, and in time it ruined them also. We have no detailed history of it. Vissering thinks the people did not use it except in transactions with the Government. In the middle of the sixteenth century China was conquered by the Mandchus, when paper money was abolished. The fundamental reason for the long mistakes of the Chinese in the matter of currency seems to have been that they could not devise a good system of public finance. They did not issue paper money when they had a surplus revenue or were at peace or to aid private debtors. In very recent times banks of issue have been established in some cities of China. They are under stringent obligations to redeem on demand, and their circulation is very limited in area. The Government engages in this business, but under banking rules and not as a political power.

This book contains a fac-simile of a venerable greenback issued in 1375.

Manners and Customs of ye Harvard Studente. By F. G. Attwood. (Boston: J. R. Osgood & Co. 1877.)—These cartoons from the *Harvard Lampoon*, the work of a student in his leisure moments, deserve the honor of being reproduced and bound together. Whether we consider the humor displayed in them, the fidelity of characterization, or the skilful draughtsmanship, they take a high rank in caricature. We recall nothing so good of their kind in this country, and, as we ventured to remark the other day in speaking of the *Lampoon*, Mr. Attwood is a worthy disciple of Richard Doyle, who, in his 'Jones, Brown & Robinson' and other familiar outlines in *Punch*, stands at the head of the school. It is easy to pick out the best of these twenty-six cartoons, and yet the average is remarkably well sustained. The smaller the canvas, so to speak (there are sometimes two drawings on a page), and the larger the scale, the poorer, as a rule, is the result. Mr. Attwood is strongest, and is very strong, in dealing with crowds, which he endows with singular vivacity and individuality, and he has a rare sense of perspective. These qualities shine in the views of commons in Memorial Hall, of the foot-ball game, the Republican torchlight procession, the Class-Day procession, the Class-Day exercises around the tree, etc. In the three last mentioned the movement of marching and swinging round the circle is admirably suggested, and so, in a more exaggerated and less artistic way, is the rush for prayers; an unseemly spectacle, which we hope may be soon abolished by removing the cause. Most of the designs depict the *milieu* with an accuracy that may be relied upon by those who have never been at Harvard. The college yard, with its trees, walks, and buildings, and the various interiors, are truthfully sketched both in the cartoons already selected for praise and also in the fencing scene in the gymnasium, the recitation and examination rooms, and the scene at the boat-houses—the last showing a delightful bit of landscape on the banks of the Charles. Some of the less edifying and least successful designs will confirm the opinion which we have heard expressed that, if a better education is to be had at Harvard nowadays than before President Eliot's revolutionary incumbency, the opportunities for wasting one's time are also greatly increased.

Mr. Attwood is still a contributor to the *Lampoon*, and the best of its humorous artists; but in departing from outlines his defects appear and his superiority disappears. We shall doubtless have from him in due season a volume, uniform with the present, on the 'Manners and Customs of ye Bostonians,' in which he has already made some happy hits.

A Book for the Beginner in Anglo-Saxon. By John Earle, M.A. (New York: Macmillan & Co. 1877.)—Mr. Earle has prepared a manual for comparatively elementary pupils. He is well known as an Anglo-Saxon scholar, and also as the author of a popular work, the 'Philology of the English Tongue.' Twenty-nine of the ninety-five pages are taken up with selections from the several Gospels, and the remainder with grammar, including three valuable pages on poetry. Except that it lacks a vocabulary, it contains enough to start a pupil very well. In simplicity the book is preferable, for certain classes of beginners, to any that we have seen. The author pleads (in the preface) for the wider study of Anglo-Saxon, as tending to furnish a ground for thought-barter between the graduate and non-graduate world. He introduces the distinction of symbolic and presentive words—elaborated in the 'Philology'—and gives good illustrations of it, though the distinction seems too refined for mere beginners. The forms of the pronoun of the first person are given more fully than those of the third, which are not given fully enough. The syntax is brief, but the treatment is interesting and valuable.

Mr. Earle has allowed his book to contain some errors which revision would have removed. The old character for *wén* is retained in many modern books, and is as unfamiliar as either *edh* or *thorn*. *A* and *i* have other sounds than those mentioned on p. 1, and it is not likely that the Anglo-Saxon *u* had the neutral sound heard in *but*. The presentive *hād* exists in the modern symbolic *-head* as well as *-hood*. The terms *strong* and *weak* are used in different senses in describing the inflections; and in defining the strong and weak declensions of adjectives the author says the opposite of what he intended. On p. 28 the genitive and dative case-forms have changed places in the singular of the weak declension, and on p. 36 (seventh line from top) *ordinal* should be *cardinal*. The correction of these and of some other errors will, with the addition of a vocabulary, add much to the value of the book.

PROF. WALKER'S

OF INTEREST TO SHAKESPEARE STUDENTS.
RECENTLY PUBLISHED:
SYSTEM OF
Shakespeare's Dramas.
By DENTON J. SNIDER.
Two volumes large 12mo, pp. 920. Price $4 50.

WHAT IS SAID OF IT:
"It certainly ranks with the works of Gervinus and Hudson."—*The Western.*
"We rank this work of Mr. Snider among the great works of literary criticism."—*Dr. Wm. T. Harris.*
"An earnest attempt to fix the intellectual and ethical laws which governed the poet in his labor."—*New York Tribune.*
"An original study of Shakespeare. Mr. Snider holds his ground with good nerve and ability."—*St. Louis Republican.*
"Neither Goethe nor Schlegel has shown so convincingly how the poet fashioned his marvellous works."—*Richard Soule.*
"The production of a thoughtful, scholarly, and earnest mind. . . . The work is original, able, suggestive, and interesting."—*Boston Advertiser.*
"Mr. Snider's work is indeed a valuable contribution to Shakespearian literature, and will be found of great use to students of the wonderful master."—*Boston Globe.*
"Mr. Snider has written a very scholarly and ingenious work, of great interest to Shakespeare students, whether his views be adopted or not."—*Prof. James K. Hosmer.*
"The work bears evident marks of the faithful student of Shakespeare, and of a mind fitted for the difficult task by more than ordinary culture and attainments."—*Chicago Inter-Ocean.*
"The purpose and movement of each play is defined in an altogether fresh way. We do not know a writer on Shakespeare who is more clear, direct, and readable than Mr. Snider."—*Boston Commonwealth.*
"Works of this sort create epochs in the history of literary criticism. Fitly entitled a 'System of Shakespeare's Dramas,' it is much more—it is an exposition of the principles of art and ethics."—*Rev. J. C. Learned.*
"Mr. Snider's work is not disfigured by any finespun or moonshiny theories."—*St. Louis Times.*
"I think his work will be recognized as a discovery. The criticism on Hamlet is certainly the best that has been written."—*Rev. K. A. Holland.*
"Each play, in turn, is treated in detail, clearing up much that critics have found obscure, and discovering and compelling the recognition of the plan upon which the poet, whether consciously or unconsciously, worked."—*Dr. John Green.*
"I congratulate Mr. Snider upon the novel and striking line of thought he has hit upon. It is something to ascend from the minute criticism of words and letters to the grand generalizations which must, even if unconsciously, have shaped the creations of the master-mind of modern literature."—*Hon. W. F. Cooper, Nashville, Tenn.*
"Mr. Snider has treated his author and his works from a standpoint that must be accorded originality . . . The work has been done carefully and thoughtfully, and the author has displayed a critical acumen and power of analysis which shall demand for him in the future an audience for whatever he may write."—*Boston Times.*

ROMANCES OF THE EAST.

(Nouvelles Asiatiques.) From the French of Comte de Gobineau. Forming the Sixth Volume of the "Collection of Foreign Authors." 1 vol. 16mo, 327 pages, paper covers, 60 cents; cloth, $1.

These stories of Asiatic life are, for freshness and graphic portraiture, among the most notable things in recent literature. They are not only vivid, picturesque, and dramatic to a remarkable degree, but, as results of the writer's long familiarity with Eastern scenes and people, they give views and insights into the life of the Asiatic people that are as surprising as they are captivating and amusing. 'Romances of the East' will open a new chapter in romantic literature.

II.

AN AMERICAN GIRL, AND HER

Four Years in a Boys' College. By Sola. 1 vol. 12mo, cloth, price $1 25.

The problem of co-education is abundantly and vividly elucidated in the career of the sprightly "American Girl," from her becoming a *freshman* to her appointment to speak on commencement-day—the only honor conferred by her university for scholarship and general standing. Charles Reade's recent creation, "Rhoda Gale," was an acceptable portraiture, drawn from imagination alone; while the "American Girl" is a life-original of one of those unique productions of girlhood, due to our special institutions, customs, and civilization, written by "one of themselves," and her 'Four Years in a Boys' College' are experiences captivating the reader's attention, and full of interest at the present day.

III.

ELEMENTS OF GEOLOGY. A

Text-Book for Colleges and for the General Reader. By Joseph Le Conte, author of 'Religion and Science,' etc., and Professor of Geology and Natural History in the University of California. 1 vol. 8vo, 588 pages, with upward of 500 Illustrations, cloth, price $4.

"A good college text-book of geology has hitherto been wanting. There has been no American work for high-class institutions which treats the subject so as to meet the requirements of intelligent and scholarly people, who yet do not expect to become independent cultivators of geological science. This manifest gap has now been filled by the publication of the work before us, and a careful examination of the volume convinces us that it has been executed with great judgment with reference to the present needs of higher education. Besides preparing a comprehensive text-book, suited to present demands, Prof. Le Conte has given us a volume of great value as an exposition of the subject, thoroughly up to date. The examples and applications of the work are almost entirely derived from this country, so that it may be properly considered an American geology. This is of advantage to the American student. A prime object with the author has been to interest his readers. We can commend this work without qualification to all who desire an intelligent acquaintance with geological science, as fresh, lucid, full, authentic, the result of devoted study and of long experience in teaching. It is profusely and elegantly illustrated."—*The Popular Science Monthly.*

IV.

FOUR YEARS WITH GENERAL

Lee: Being a Summary of the more important events touching the Career of General Robert E. Lee, in the War between the States; together with an Authoritative Statement of the Strength of the Army which he commanded in the Field. By William H. Taylor, of his Staff, and late Adjutant-General of the Army of Northern Virginia. 1 vol. 8vo, cloth, $2.

"It was my peculiar privilege to occupy the position of a confidential staff officer with General Lee during the entire period of the War for Southern Independence. From the time he assumed the duties of the position of general-in-chief of the Army of Virginia; through the campaign in the western portion of the State; during the time of his command of the Department of Carolina, Georgia, and Florida; while he was charged with the control of the military operations of all the armies of the South, at Richmond; and in all his campaigns, when in command of the Army of Northern Virginia—I had the honor to be at his side. Of necessity, therefore, some facts concerning him and the army movements which he directed are known to me which are not of public record; and perhaps some value will attach to my statements in regard to those matters of fact which came under my immediate observation, and the recollection of which is still fresh in my memory. I propose to speak of these briefly and with entire candor."—*Extract from Preface.*

V.

ST. PAUL'S WITHIN the WALLS.

An Account of the American Chapel at Rome, Italy; together with the Sermons preached in connection with its Consecration, Feast of the Annunciation, March 25, 1876. By the Rev. R. J. Nevin, D.D., Rector. 1 vol. 12mo, cloth, $1 50.

"The widespread interest manifested in the work of building St. Paul's Church in Rome is a sufficient reason for the publication of this volume. The author feels the need only of an apology for its late appearance, and begs to plead in excuse for this the exhaustion following six years of heavy and unbroken toil and anxiety, and the pressure of duties whose daily fulfilment seemed to have a first claim on his time and strength."—*Extract from Preface.*

VI.

THE LAST YEARS OF DANIEL

Webster. A Monograph. By George Ticknor Curtis. 8vo, paper cover, 50 cents.

Either of the above sent, *free by mail*, to any address in the United States, on receipt of the price.

Ready Saturday, January 19.

Democracy in Europe.

A History. By Sir THOMAS ERSKINE MAY, K.C.B., D.C.L., author of the 'Constitutional History of England.' Two vols. 8vo, 500 pages, cloth extra, gilt tops, $5.

From Author's Preface.

"If any profession of political faith is expected, as a pledge of the spirit in which this history is written, it is this: I hail the development of popular power as an essential condition of the social advancement of nations; I am an ardent admirer of political liberty—of rational and enlightened liberty, such as most Englishmen approve; and I condemn any violation of its principles, whether by a despotic king or by an ill-ordered republic."

The Nation.

NEW YORK, THURSDAY, JANUARY 24, 1878.

The Week.

THE latest evolution of the silver movement is a "League," got up at Washington, and composed of members of Congress of both parties (B. F. Butler being one of the chief promoters of it), and having for its object the remonetization of silver, maintenance of the greenbacks in circulation, and their substitution for national banking currency. They held a private meeting on Tuesday, at which Mr. Fort counselled the abandonment of the attack on the national banks, as undertaking too many things at a time, and carried his point; and B. F. Butler then made the suggestion that if the President annoyed the silver-men by vetoing their bill, they should refuse to vote the appropriations until he surrendered, and his remarks were received with great applause. It was said that one hundred and fifty members of the House would support this little plan, but, as a trifling concession, they would pass the Post-Office appropriations in order not to inconvenience the people. The enlightened assemblage then adjourned, subject to the call of the chair. It can hardly be doubted that the promulgation of this desperate and revolutionary scheme shows a decline of confidence on the part of the silver-men, and is really an attempt to intimidate the President.

The Charleston Chamber of Commerce has followed the example of that of New Orleans, in passing unanimously a series of resolutions denouncing the attempts to postpone resumption and remonetize silver as "incompatible with national, commercial, and personal honor," and protesting against the payment of the bonds in anything but gold, and declaring it "shameful to permit by law or encourage by national legislation the payment of public, corporate, and private debts in a debased coinage, especially and avowedly created for the purpose." This is all true and good, but we fear it will offend people in the West. Senator Butler, of South Carolina, has been talking in the same sense. Another good sign comes from the South in the account of the elections in Beaufort, Georgetown, and Sumter (S. C.), where the Republicans elected all their candidates without the aid of troops or carpet-baggers. In Sumter the election was for members of the Legislature, and after the vote some Democrats carried off enough ballot-boxes or ballots to leave a majority for the Democratic candidate. The vote had, however, previously been counted, and showed that the Republican candidate had been elected, and the Commissioners of Election (Democrats) made no return of the election, but sent a simple statement of the facts to the House of Representatives, which thereupon promptly seated the Republican candidate. We hope those who have held that the South is now an exception to the ordinary operation of social and political laws will take note of these facts. They show, with scores of others, that the forces of civilization work in South Carolina as well as elsewhere.

Congress continues to dawdle. The Senate has been mostly occupied in persuading itself that the Matthews resolution ought to pass, the opposition being imperceptible. On Wednesday week Mr. Morrill's motion to refer it to the Judiciary Committee was defeated by a vote of 31 to 19, in a thin session. On Monday Mr. Cameron introduced a bill, understood to be not his own, providing for free coinage of the dollar of the fathers, and making it a legal tender for all debts, public and private, in conjunction with gold only, and to the amount of fifty per cent. only. Mr. Beck, on the same day, moved a concurrent resolution designed to prevent the imposition of further taxes on behalf of the sinking fund, and the issuing of any more bonds to reduce the national debt till Congress shall so order. Mr. Beck thus goes Mr. Matthews "one better." For the rest, the Senate spent Thursday in listening to more or less perfunctory eulogies of the late Senator Morton. Among them all, the substance of what Mr. Morgan, of Alabama, had to say—viz., that in a time when all public men were liable to suspicion Mr. Morton was never suspected of corruption—seems to us most worthy to be repeated and remembered. The House paid its respects to the dead Senator on the following day. On Friday the Senate received a message from the President covering a letter from the Attorney-General which declared the Executive powerless to initiate proceedings against the Union Pacific Railroad for its discrimination against the Kansas Pacific, and that additional and explicit legislation was necessary. A bill to provide this legislation, and to furnish the Attorney-General authority for intervening, was introduced by Senator Chaffee, of Colorado, on Monday. On Tuesday, Mr. Blaine supplied the indispensable *bouffe* by an attack on Massachusetts in a pretended welcome to a statue of a Maine governor. On Thursday the House passed a joint resolution of thanks to the explorer Stanley, and a bill from the Judiciary Committee empowering the accused in criminal cases before Federal courts to testify in their own behalf if they so desire. On Monday Mr. Southard, of Ohio, moved to suspend the rules for the passage of a bill making customs-dues payable in greenbacks after Jan. 1, 1879. As such a bill would be superfluous in case of resumption, it was properly regarded as hostile to resumption, and the motion received less than a two-thirds majority, 154 to 96.

Secretary Schurz has been applying his "theories" in what some of "the practical men" must consider a most repulsive fashion to the investigation of affairs in the Freedman's Hospital at Washington. Charges of a serious kind were made to him against the management of the institution, and notably that at certain periods of the year double the amount of needed supplies were bought for it. He therefore appointed a Committee of Investigation, composed of Dr. Hood of the Pension Office, Mr. George Ewing of his own office, and Mr. J. H. Walsh of the Land Office. They reported accordingly, acquitting the officers of the hospital of everything brought against them. Unfortunately for themselves, however, they annexed to the report the testimony which they took, and, more unfortunately still, this testimony the Secretary read, and was surprised to find that it in no way bore out the report—in fact, contradicted it. To make sure of his own impression, however, he submitted it to the Solicitor of the Interior Department, Mr. Marble, for review, without informing him of his own conclusions. The Solicitor discovered the same fatal discrepancy. The Commissioners, being summoned, were puzzled, and at last one of them explained that the report was based on testimony not reported. This remarkable explanation was, of course, followed by the repudiation of their report, and the removal of Dr. Palmer, the manager of the hospital. This at once brought down the trustees of the Howard University, with the Rev. Dr. Patten at their head—Seelye fashion—to protect Palmer and appeal to the President. They were, however, met at the White House by the Secretary with his "theories," and overthrown after a full hearing.

That Mr. Bristow's name still stands, as it stood a year ago, for reform, and that the disappointments, small and great, which the present Administration has inflicted on reformers have caused them to return to him both with hope and remembrance, was shown in an invitation to dinner which he received in Boston last week from a number of those who supported his nomination at Cincinnati. The success of the entertainment and the outspokenness of Mr. Bristow's speech have probably caused more of a flutter in the political world than its promoters expected. He spoke with great earnestness in defence of an honest currency, on the importance to all classes of a stable standard of value, and on the absurdity of supposing that it is the rich and not the poor who most profit by it. He expounded once more the Fifth Resolution of the Cin-

cinnati platform, and reminded those who are discouraged by the small progress yet made in carrying it into execution that they were attacking "an ancient and deeply-rooted practice," that "their enemies were strongly entrenched," and that success must be won by a series of progressive movements, and pointed to the anti-slavery struggle as an illustration of what may be accomplished by persistent effort from small beginnings. He was on all these points loudly applauded. We regret to say that a letter was read from Governor Rice which said that "he heartily united in the desire for the purification of the civil service, for which Mr. Bristow's name has long been a synonym." There must be some mistake about this. Mr. Rice is really in favor of the present system, and thinks a republic ought to be officered as if it was "a monarchy turned upside down"—that is, with the chief executive officer at the bottom and on his head, where he can neither see nor control anything that is going on up around his legs, where the public and the administrative machinery must be supposed to be.

A very interesting though somewhat crude report on the "tramp" nuisance has just been submitted to the Governor of the State by the chief of the Massachusetts detective force. It is suggestive, though at a long interval, of those adventures of an "Amateur Casual" the appearance of which in the columns of the *Pall Mall Gazette* early in 1866 first brought Mr. Greenwood prominently into notice. The chief detective, it seems, in July last sent out two of his force to experiment on "tramp" life among the Berkshire hills. Their experience was somewhat startling. They seem to have found an unorganized brigandage existing amid those pleasant summer resorts. They met and associated with gangs of vagabonds following theft and beggary as a profession, camping together by scores in the woods, begging, stealing, drinking, and fighting. They were natives of many lands, but chiefly Irish. An outgrowth of the famous "bummers" of the Rebellion, their ranks "are constantly receiving accessions from young men who are even more reckless and unscrupulous than those who preceded them." Pretending to travel in search of employment, they despise every kind of honest labor. So great has the nuisance become that the chief detective says: "Instances have been brought to my notice where people who live in the outskirts of towns are compelled to leave their homes to avoid the dangers and the troubles which threaten them from this cause"; while "reports come from all parts of our commonwealth of crimes committed—thefts, incendiary fires, assaults, rape, and even murders—which can be traced to no other parties, and which must have been committed by no other class of people." Their number during the winter season he estimates at about one thousand in the entire State.

The remedy proposed for this growing evil shows very clearly that Chief Detective Luther Stephenson, jr., is not a student of social science. Had he ever read as familiar a book as Renwick's Life of Count Rumford in Sparks's 'American Biography,' he would have found exactly the same condition of affairs portrayed as existing in Bavaria a century ago. "Under the pretence of being travelling journeymen, numbers of idle mendicants were continually strolling from town to town, and returning, to begin a new circuit, as soon as time had been allowed for their faces and persons to be forgotten. . . . Beggary had become a trade, and was handed down as a profession from generation to generation. Numbers had, therefore, grown up not only unacquainted with any description of work but with the greatest aversion to regular labor. Crime had become rife among them, and they were callous to all sense of shame." To cure this condition of affairs, Count Rumford did not, however, as Mr. Stephenson recommends, have recourse to a system of licensed vagrancy. He arrested the beggars, and set them all to work for their food and lodging first, and proceeded, with profound knowledge of human nature, to reform them afterwards. If the "tramp" evil assumes in this country, as now seems not improbable, dimensions of a really alarming character, the great difficulty in the way of properly handling it will be found in that same feeling which now resists any effort to limit the suffrage on questions of municipal expenditure. As the immutable natural right of persons to travel about for the purpose of obtaining employment cannot be curtailed, the army of tramps will enjoy a long immunity from molestation. The problem is, in truth, one not easy to solve theoretically. No person because he is poor should be tied to the soil, and yet the sturdy beggar should be restrained. The practical remedy will probably be found in Massachusetts just where Rumford found it in Bavaria. The spectacle of a goodly number of professional vagrants being promptly arrested and made to work, and work hard, for their board and lodging will greatly encourage the rest to efforts at voluntary and honest labor.

There has been nothing more curious of late than the amount of interest excited by, and discussion expended on, the question of the existence or non-existence of hell, and on its nature as a place of punishment. The "secular press," too, has given nearly as much attention to it as the religious press and the ministers, most of whom have preached on it. But the attempt to get at the exact opinions of the clergy about it may be said to have failed, and doubtless for the simple reason that very few if any Protestant ministers now hold to the old literal fire-and-brimstone theory, and when once this is abandoned all descriptions of the sufferings of hell must necessarily be vague and shadowy. Many of the reporters and newspaper writers who have pursued the subject seem to think it a question of majorities, and that if the greater number of ministers say that there is a hell, a hell there is. The matter has given rise among the "seculars" to a good deal of levity, and there has been much jocose insinuation that those who argue against future punishment have strong personal reasons for wishing that there may be no such thing. The plan of settling the question by "most votes" will doubtless find favor in the West, which now seems disposed to solve even geometrical problems by the ballot. We should all like to know what "the Ohio opinion" is on the subject, and, above all, what Mr. Stanley Matthews says about it. We hope he is not going to leave the Senate without settling it. A joint or concurrent resolution on it from his gifted pen would be a useful and appropriate close to his remarkable official career.

The Central Park in this city, after having for twenty years escaped the political net, seems likely at last to become the prey of Tammany by the dismissal of Mr. F. L. Olmsted, the designer and, until now, the director of it, and the transfer of the active management to four commissioners, all of whom are wholly ignorant of landscape gardening and owe their positions solely to their political connections, and three of whom are almost unknown to that portion of the public whose opinion on park management is of any value. The amount of money which has been spent on the park is so great, and its usefulness to the city as an attraction to residents and a health resort for all classes so marked, that it is to be hoped that some effort will be made at Albany, if none can be made here, to save it from damage by putting it into the hands of a single commissioner appointed by the mayor. This is absolutely necessary for proper responsibility in its management. No one man would venture to propose what these four commissioners propose—to carry on a public work of this class out of his own head without professional assistance. A strong protest against their proposed action, signed by 185 of the leading citizens and firms, of all parties and all professions, was presented to the Commission on Wednesday.

During the week the price of gold fell to 101¼, the lowest since April 26, 1862, making the gold value of the U. S. legal-tender note for one dollar $0.9852. The decline was due in part to the fact that $1,500,000 gold was on its way here from London. The explanation of this apparently strange movement at a time when U. S. bonds are coming back on every steamer is, that the excess of our trade exports over our trade imports is so large that the bonds returned have not been sufficient to offset it entirely, and that the London money market is so easy that no effort is made to force this

country to take U. S. bonds in payment instead of gold. In New York the Matthews resolution is lightly thought of, inasmuch as even if it be adopted it cannot have the force of law. Whether a solemn declaration of a large majority of the legislative branch of the Government that the bonds can by right be paid in silver will be received with the same complacency in the foreign markets, is not so clear. Silver closed in London at 53½*d.*; and the gold value of the bullion in a 412½-grain silver dollar at the close of the week would have been $0.8933.

Dun, Barlow & Co.'s interesting annual statement of the failures of last year throws more or less light on the cause of the growth and spread of the silver frenzy. The total amount due by the bankrupts of 1877 was $190,700,000, which is a slight decrease on 1876—only half a million—a decrease of $10,300,000 on 1875, an increase of $35,500,000 on 1874, and a decrease of $37,800,000 on 1873, the panic year. The financial disease during the past year seems to have raged more particularly among the small traders. It is the distribution of the failures, however, which is instructive, as regards their influence on opinion touching the currency question. The failures in the Eastern States have steadily declined in amount during the past three years; in the Middle States there was a slight rise in 1877 over 1876, but a decline from 1875, and the amount last year was large—$77,173,750. In the Southern States also there has been a steady decline from 1875 on. In the Western States, on the contrary, there has been a steady and heavy rise since 1875—that is, from $33,948,254 in that year to $56,187,074 in 1877. It is impossible to doubt that it is this increasing difficulty in settling with creditors which led to the discovery in 1875 of "the gold plot" of 1873, and produced that remarkable burst of filial affection for the old dollar on the part of a vast body of men who never saw or handled it, on which the civilized world is now gazing with cynical interest. It is also worthy of observation that the failures of the first nine months of 1877 were comparatively few, and small in amount, but that after Congress met in October they increased heavily. It may be that Congress was not instrumental in causing this, but it is difficult to avoid the conclusion that the prolongation of uncertainty produced by the outburst of the silver craze at Washington brought down great numbers who had struggled through the year, and who, with a continuance of peace and quiet, would have survived.

The English Parliament was opened on the 17th as announced. The Queen's speech, which was read by the Chancellor, after recalling England's determination to remain neutral in the contest, said that Turkey, after the late successes of the Russians in Europe and Asia, had applied to all the Powers for their good offices in bringing about negotiations for peace, but they had refused to interfere. The Sultan then applied to England alone, and the Government transmitted to the Czar the expression of the Sultan's desire for peace and of its own hope that it might be possible. Further communications on the subject had been exchanged, but the result had not yet been announced, further than that Russia firmly insisted that the Turks should apply directly to its commanders in the field for the opening of negotiations and the cessation of hostilities. The Queen declared that neither belligerent had infringed the conditions of English neutrality as laid down at the outbreak of the war, and until it did so her attitude would not change, but she could not conceal from herself that some unexpected occurrence might render it necessary to take measures of precaution.

In the debate on the address which followed, Beaconsfield distinctly denied that there were any divisions in the Cabinet, or that he had said or written anything during the recess to cause uneasiness. Sir Stafford Northcote took the same ground in the Commons, and the position of the Ministry as defined by both was one of expectancy—that is, thus far nothing to excite alarm or call for action had occurred, but as long as the Russian demands on Turkey were unknown it was impossible to say that all danger was over. In Beaconsfield's speech there was the usual vague and somewhat threatening boastfulness about the great things England would do if she had to fight, which seems to mean nothing in particular, but has nevertheless kept the country in a state of anxiety, and made the small and insignificant "war party" seem much more formidable than it really is. The Queen's speech and the debate seem to have taken away the Turk's last hope and precipitated the despatch of plenipotentiaries to the Russian camp.

Suleiman Pasha, pursued by Gourko, and threatened in front by Russian columns approaching the railway to Adrianople, made repeated stands between Tatar Bazarjik and Philippopoli—as it now appears—before giving up the hope of fighting his way through to the capital of Rumelia; but after very heavy losses was forced to abandon the direct line of retreat and march southward through the Rhodope Mountains, in the direction of Kavala, at the head of the Archipelago, thence to be transported by sea to Constantinople. According to a Turkish announcement, the bulk of his army has succeeded in reaching Drama, about eighteen miles northwest of Kavala. Tatar Bazarjik, in the rear of Suleiman, was occupied by General Skobeleff. Further east, Eski Zaghra, Yeni Zaghra, and Harmanly were entered by the Russians without resistance, and finally, on January 21, Adrianople opened its gates to them, the Turkish garrison having withdrawn after blowing up its stores of ammunition. Some Russian detachments are said to have advanced as far as Demotika and Usun-Köprü. In Constantinople, which was becoming gorged with starved refugees from the interior of Rumelia, preparations for defence were made under the military command of Mukhtar Pasha, the enrolment of all free males was decreed, and help was summoned from localities not directly threatened; the removal of the Sultan and the Government to Brusa, in Asia Minor, was expected under certain contingencies. Troops were concentrated at Kirk-Kilisseh, about thirty-five miles east of Adrianople. In Bulgaria, in the meanwhile, Kazan and Osman Bazar were evacuated by the Turks, and the investment of Widdin was completed by the Rumanians with the occupation of Florentin, on the Danube. The Montenegrins occupied Dulcigno, on the Adriatic, without resistance, and the Servians are reported to have taken Prishtina, and to be marching on Novi-Bazar in Bosnia. According to despatches from Greek quarters, an insurrection of some magnitude has broken out in Thessaly, under the lead of volunteers from Greece, and the royal troops at Chalcis have been ordered to march to the frontier; but the latter statement may justly be doubted. In Asia the Russians, on January 13, captured Artvin, a fortified town, about thirty-six miles south of Batum. Retrospectively we must remark that the Russians assert the number of prisoners captured at Shipka to have been as large as twenty-five thousand.

Server and Namyk Pashas, the Porte's plenipotentiaries for the negotiation of an armistice and, if possible, of a treaty of peace, appear to have proceeded on their mission with intentional dilatoriness, or else to have intentionally been delayed by the Russians. They reached Harmanly on January 16, and Kazanlik, then still the headquarters of the Grand Duke Nicholas, as late as the 20th. Nothing has yet transpired concerning their instructions, or those sent from St. Petersburg to the Grand Duke, that may be said to have an authentic look. According to concurrent telegrams from Constantinople, Count Zichy, just before the departure of the peace delegates from that capital, declared to the Porte in the name of his Court that Austria, though not opposed to an armistice on the basis of peace preliminaries, would not be ready, as a signer of the Treaty of Paris, to recognize a peace concluded without her assent to its different stipulations. This startling announcement, coupled with the report that Lord Derby had sent a similar declaration to St. Petersburg, seemed to receive a confirmation from the "official" acknowledgment of the latter fact by the London *Post*, and was also sustained by the Vienna *Neue Freie Presse;* but it was soon after declared by correspondents, both from St. Petersburg and Vienna, to be erroneous, Austria having made no new communication to the Porte since her answer to the Turkish note of December 12, asking for mediation, an answer which contained reservations similar to those now spoken of.

THE SOUTH AND THE SILVER FRENZY.

SOUTHERN politicians had before the war a well-earned reputation for cool-headedness and clear-headedness on questions not connected with slavery, and they especially distinguished themselves, except in Mississippi, by their honesty and sobriety in the management of their State finances. This has furnished to those who, like ourselves, have watched with alarm during the last ten years the gradual coalition of Republicans and Democrats at the North in open or disguised attacks on the public credit, a reason of the strongest kind for the close of the carpet-bag régime. We hoped that the leading men at the South, when once delivered from conflicts with their domestic thieves, would render real service at Washington in supporting the purification of the currency and an honest discharge of the public obligations. We know very well that a year ago hopes of this kind were treated by many good people at the North as chimerical if not wicked. The theory about Southern men which it was found convenient to preach during the late canvass was that they were intent not on the restoration of their fortunes, but either on the production of anarchy or the plunder of the Treasury. Opposed as this was to all the teachings of history and all experience of human nature, it was, down to the day of the count in February, in the judgment of a large proportion of the Republican party, almost useless to gainsay it. The count disabused a great many; the others have been ever since gradually opening their eyes. A remarkable article in the last *Harper's Weekly* acknowledges in terms that the campaign view of the Southerner was "a delusion," as we had the honor to point out to that paper and others at least a score of times between July, 1876, and February, 1877. The refusal of the Southerners to join with the Northern Democrats in breaking up the count and plunging the country in frightful disorder, showed that they were weary of strife, and that, if not model politicians in other respects, they longed for a settled government, even if it was not the government of their choice, and preferred even a President whom they did not think lawfully elected to the confusion of a conflict between two rival candidates. All that has since happened at the South points to the same conclusion. Industry has been reviving; the last crops have been very large, and could only have been sown and gathered by a community in which life and property were, on the whole, reasonably secure. On financial questions, however, the South is still weak. The enormous grants made to Northern railroad speculators since the war, the spoliations of the carpet-baggers, and the demoralization wrought by paper money, which was greater at the South than anywhere else, and the passion for dishonesty which their Democratic friends at the North continue to display, have apparently destroyed or greatly weakened the old Southern acuteness as to the conditions of sound finance. Forty years ago there would have been a score of Southerners in Congress pouring cold water on the heads of the silver lunatics; to-day a large number of them are apparently content to follow in Congress the lead of publicists like Bland and Kelley and Voorhees in dumb and docile silence, though there are honorable exceptions like Senators Bayard, Butler, and Hill. In their State legislatures they are trying to settle the State obligations with apparently as little thought of the future as might be displayed by Citizen Schwab in making an equal division of goods. Most of the "scaling" and "adjusting" schemes of the Southern States are puerile in their short-sightedness, and short-sightedness used not to be a characteristic of Southern politics. Even the defence of slavery, which towards the end was marked by so much madness, had all the characteristics of a deeply-pondered policy looking to remote results. Settling with public creditors at fifty cents on the dollar and five per cent. interest, to save taxation which nobody would feel, is a mode of securing happiness in which thought for the future has no place.

As regards the course of Southern Senators and Representatives on the silver question, there are certain considerations to which we take leave to direct their earnest attention.

1. The silver movement is simply a continuation of the inflation movement of 1875. All the inflationists support it. There is no paper inflationist who is not a silver-man, and the reason is that the remonetization of silver is, in his estimation—and he is right—the next best thing to fresh issues of paper money, of which he now despairs. It owes its present success to the union of the bad and thoughtless elements in both parties. It originated in the hostility of the Democrats to the public credit, which led them as soon as the war was over to throw their traditional hard-money doctrines overboard and take up the once-hated greenbacks as the best possible currency. It has been strengthened by the gradual apostasy of large bodies of Republicans, partly under the influence of unprincipled leadership and partly under the pressure of hard times. It is thus breaking up both parties. Neither can come out of it as it went in. It is gradually leading to the combination of the more rational and patriotic men of both in defence of honest and civilized government, and with this combination the best interests of Southern politicians lie. Of course there are plenty of materials for a dark view of the future of the United States, as of every modern state, but the conditions of good and successful government are well known; and if experience be of any value in human affairs, the influence of such men as are now dragging the country towards repudiation and fraud must pass, and their schemes be discredited and exploded. They have no future; they are not persons to be counted on or supported. The best allies of the South are those men of both parties at the North who think and reason and foresee, and are familiar with the causes of national prosperity as revealed by history, and do not, like Sitting Bull, imagine that whatever they do not remember or have never heard of never happened.

2. The silver movement is a true frenzy, such as often seizes on large bodies of men in times of danger or suffering, and is supported by delusions precisely similar to those which in more ignorant and excitable communities have led to frightful excesses. It must, therefore, whether it succeeds in procuring legislation or not, soon come to an end. In another year it is most probable politicians will be denying they ever "took stock in it," or even knew much about it. It is one of a kind of frenzies, too, to which the West, owing to its isolation and self-confidence and impatience and contempt for "abroad," as Stanley Matthews says, seems to be growing increasingly liable. The Granger movement was the last, and it is impossible to say what the next will be. In proof and illustration of this let us remark that it is based on a story for the like of which in absurdity one has to go back in Anglo-Saxon history to the witch-trials, and in French history to the first Revolution—viz., that a band of European capitalists came or sent agents to America in 1870 and began *secretly* to procure the passage of an act for the demonetization of silver, which they kept for three years before two Congresses and two committees, and had printed thirteen times, and finally got passed, all the while concealing its real nature from the 327 legislators and from the President and from the reporters of the newspapers; and all this in order to raise the price of their own bonds. There is no more ridiculous story than this in political history, and the fact that it has secured wide credence in a country like this, with such a press as ours, is in itself proof of a diseased state of the public mind.

The movement receives no support from any scientific man, or any man at home or abroad who has made a study of currency or is accepted as an authority on it here or in Europe. All the leading bi-metallists denounce or ridicule it, and point out its obvious consequences; and the fact that what they say makes no impression whatever on the silver-men, any more than it would on insane persons, is another noteworthy characteristic of the agitation. Finally, no silver-man, as far as our observation has gone, defends his plan with rationality or coherence. The same person will maintain in the same article or speech that "the money kings" procured the demonetization of silver because they knew it was going to fall in spite of them, *and* in order to make it fall; that it fell because demonetization threw great quantities of it out of use; that little or none of it was in use (a fact), but that demonetization has mischievously prevented its coming into use; that the debtor is entitled to the benefit of the fall, the contract having been

made in either metal; that if remonetized it would rise, and the fall would disappear; that there never has been any fall at all, the appearance of a fall having been caused by the rise in gold; that "cheap" money—that is, money of small purchasing power—is a good thing for the laboring man, so that the less he gets for his dollar the better off he is; and, finally, that the capitalists and bankers of the civilized world are opposed, by interest, to the revival of industry and the prosperity of other classes of the community, and prefer making profits by "plots" and "conspiracies" to making it by the regular business of production and exchange.

Now, we only need to state these things, we hope, to Southerners of ordinary intelligence and education to convince them that the silver movement draws all its strength either from delusions bordering on real insanity—that kind of epidemic insanity of which there are so many instances in history—or the downright dishonesty of sorely-burdened speculators, who think that even a brief rise of prices would enable them to get rid of their commodities or their debts. It is not in alliance with either lunatics or knaves, however, that the South can hope for regeneration. A thousand roads to prosperity have been tried by various peoples in various ages since the dawn of civilization, but one only has ever been found safe and easy for any people which sought to be both free and secure, and that lies through respect for plighted faith, for just weights and measures, for upright judges, and for the recorded experience of mankind. Any party which, in a civilized country, makes light of these things may reign for a while as mobs reign, but it cannot reign long, for even the social instincts of the race fight against it.

THE TURKISH COLLAPSE.

PROBABLY before this reaches our readers the conditions of peace between Turkey and Russia will have been settled at Adrianople, and the Turks will have begun to realize the fatal change which has taken place in their position as a European power. The rumor which comes from England that the Queen has addressed herself personally to the Czar, asking him "to spare Turkey," is probably untrue. Such an interference in an important diplomatic negotiation would be unconstitutional as well as indiscreet. In any case "sparing Turkey" would not properly mean sparing the Turks; on the contrary, sparing Turkey means imposing on the Turks as hard conditions as are consistent with their political existence. In doing so the Russians are not dealing mercilessly with a conquered country; they are binding a brigand over to keep the peace, and taking his weapons away from him. Turkey, as far as Europe is concerned, means and ought to mean the Christians; as regards law, industry, progress, and future international relations the Turks are a mere evil, which has to be carefully and cautiously and perhaps slowly removed, but the permanence of which is not to be provided for, and the legality of which is not to receive one whit more recognition than is absolutely necessary. All treaties or arrangements made with them ought to contain plain and standing notice that their departure from Europe is confidently looked for and is to be prepared for. Mr. Gladstone was much ridiculed last year for having said that the Turks must be turned out of Europe "bag and baggage," and he was sufficiently impressed with the clamor the remark raised to explain that he meant simply official Turks. But he need not have shrunk from the original statement, except in so far as it meant sudden or violent expulsion.

The withdrawal of the Turks from Europe has, in fact, been going on steadily under Christian pressure ever since their defeat at Vienna. There was once a considerable Turkish population in Hungary, Moldavia, Wallachia, and Bessarabia, from all of which it has totally disappeared. Servia contained a large body of Turkish landholders down to within sixty years; there is not one to be found in that country now. In Greece, at the outbreak of the Revolutionary War, there were plenty of Turks; a Turkish resident in the kingdom, at least outside the towns, is now a thing unknown. The Turkish movement from Bulgaria southward, and even into Asia, has been, if slow, very steady ever since 1829. The growth of the Christians in wealth, and population, and political weight, and the dread of Giaour invasion, makes the genuine Turk uncomfortable in the frontier provinces, and makes him long for Asia. Few travellers in Bulgaria and Rumelia within the last fifty years have failed to meet emigrant trains of Turks pushing slowly towards Constantinople with the intention of crossing into Anatolia, with their oxen, and rugs, and pots, and pans, weary of the growing sauciness of the infidels. In fact, the Turk is a true carpet-bagger: he will not stay in any country in which he cannot hold high office and bear sway. So that if Russia now uses the power which the fortune of war has given her she may cause a prodigious exodus of the true believers within the next twenty years, and a corresponding simplification of the problem of political reorganization in the European portion of the Empire.

Those who are fond of the Providential view of history may find in the struggle which is just now closing abundant materials for the illustration of their theory. It is more than fifty years since the official class in Turkey became aware that the continuance of their theocratic government in Europe was impossible; that the salvation of the empire depended on the concession of equality to the Christians and the adoption of European methods in the civil and military administration. Mahmoud began the change in true Turkish fashion by the wholesale massacre of the Janissaries. Each of his successors has in turn done his best to carry on the work of "reform within the party," and has enjoyed the extraordinary advantage of being protected, as it were, from disturbance while doing so by the jealousy of the European powers. No other worn-out state or waning caste has ever had such an opportunity of recovery accorded to it. The Crimean war cost Turkey very little, France and England having done most of the fighting, and it simply served as a friendly warning that the process of assimilation must be continued and hastened. It even procured Turkey what she had never had before, an opportunity of borrowing heavily in London and Paris. The money thus obtained ought to have been applied to the construction of roads and bridges, and the employment of skilled functionaries, and the organization of a proper police, and the establishment of schools. These things would have furnished the best defence against Russian aggression, and would have laid the foundations of the Empire anew, and brought Mohammedanism within the pale of civilization and secured the sympathy of Western nations.

In spending the money on iron-clads, breech-loaders, and huge government offices it seems as if the Turks were simply executing a decree which sentenced them to perish by their own customs and vices. They bought the finest iron-clads in the world, and they have been of little more service to them than so many despatch-boats. They armed their troops with the best rifles ever made, and it has hardly worked the slightest change in their relations to their enemy. In fact, there has been nothing more curious and instructive in this war than its resemblance, so far as the Turks were concerned, to all other wars since the destruction of the Janissaries. The point in which European armies gained most on Turkish armies during the eighteenth century was mobility. In this, the Turks, once pre-eminent, fell off steadily as their force of cavalry declined and the discipline of the Janissaries became relaxed, while the Christian troops progressed in it under the influence of the tactical improvements of the French and Prussians. They, however, lost none of their native valor, and accordingly they became between 1700 and 1853 nearly as famous for their desperate tenacity in defending fortresses as they had once been for the impetuosity and rapidity of their invasions. Belgrade, Ismail, Silistria, Varna, in fact all the great frontier fortresses, have within that period been held by them with indomitable courage, the shopkeeper from the bazaar manning the ramparts and barricading the streets with even more ferocious obstinacy than the regular soldier. The war now closing reveals the fact that the Turks have not made the slightest advance in the military art during the last forty years. The war of 1877 has been in all respects like the wars of 1828-29 and

1853–54, plus the breech-loader. It has shown the same lack of strategists, the same absence of brigade and divisional organization, the same absence of commissariat and transport and medical service, the same inability to move in the open field, and the same skill and determination in the defense of fortified places. Osman Pasha stopped at Plevna because he was too late in getting to Nicopoli, and then he did what his father would have done in 1853, or his grandfather in 1828—buried himself in the earth with rice and crackers and plenty of cartridges, and fought like a rat in a corner, butchering the wounded and refusing burial to the dead, but letting the proper time to retire slip by, and finally submitting to be "bagged."

The attempts to relieve him were marked by the same characteristics. Suleiman Pasha, after driving Gourko's small force back into the Balkans, squatted down in the Shipka Pass, and fought away there through a precious month, when he ought to have joined Mehemet Ali at Osman Bazar. Mehemet Ali made a forward movement in August, but was unable to maintain himself at even a day's march from his base, and when the Russian advance began it was met by no manœuvring on the part of the Turks, none of the obstinate fighting in retreat by which civilized armies have often won renown, and even cowed or foiled an invader. Wherever the Turk is struck in position he defends himself desperately; but if he is driven out and followed, that is the last of him. The inability of the force in the Shipka Pass to quit it in time was even a more striking illustration of barbarian sluggishness and *insouciance* than Osman Pasha's clinging to Plevna until the Russians had brought up their reserves and shut him in.

In nothing, however, has the Turk's ignorance of the essential conditions of his political existence, and, one may say, of his incapacity for civilization, been shown more clearly than his treatment of the Bulgarians since the outbreak of the war. The fierce excitement caused in England and Russia, and, indeed, throughout Europe, by the massacres at Batak and other places, followed as they were by the threat of coercion involved in the meeting of the Conference, was warning enough, if warning was needed, that his danger lay in his relation to the Christian population and their state of mind towards him, particularly in Bulgaria; that it was this which was depriving him of Western sympathy and help. One can understand why, when hostilities began, this should not have prevented the Pashas in command from laying a heavy hand on Bulgarian supplies and Bulgarian labor, for the necessities of war are inexorable. But it is a curious fact that nearly every one of them seemed to think that nothing was more important than hanging Bulgarians. Suleiman Pasha, after his arrival in the Balkans, is reported by friendly correspondents to have hanged fifty every morning before his breakfast. The others did the same. There was a gallows in constant use at every headquarters, on which wretched peasants were strung up by the dozen on mere suspicion or from mere caprice, under the eyes of the European correspondents and doctors. Even the gallows, however, was a concession to foreign opinion. In the beginning, in Adrianople, a large city, the prisoners were dragged along through the streets by the soldiers, who collected money from the shopkeepers for not hanging them to the awnings at their doors, until they found some one who would not or could not pay, and at his door the poor wretches met their fate, after all the torture of listening to the previous negotiations. At the period when this deviltry was at its height, it is true the Turks thought they were going to beat the Russians off, and might bid for the moment defiance to civilization, but it none the less showed a savage obtuseness of perception as to the permanent necessities of their position. It has helped, however, to dissipate any doubts that might have lingered in the Western mind as to the proper fate of such a race, and has made the roar of the pursuing Russian guns a joyful sound in the ears of all those who believe that no man can be so unfortunate or so degraded as to lose his right to justice, and that no length of prescription can give tyranny a good title. The Turk is finding out, too, now at Adrianople, as we predicted he would, that the defence of Plevna was the greatest misfortune of the war, and that the brutal valor of his only hero has probably doubled the Russian demands.

CLERK GALPIN'S CASE.

WASHINGTON, January 22, 1878.

THE manner in which the dismissal of Mr. S. A. Galpin from the position of Chief Clerk of the Indian Bureau has been made a national question, and the press of the country become enlisted on one side or the other of his case, is a curious illustration of the difficulties which surround the introduction of reform in the administration of public offices at Washington. The case may be looked at in two ways—one from the point of view taken by Mr. Seelye in his letter to the *Tribune*, the other from that taken by Mr. Schurz in his published interview last week. Which of these two views is right it is well worth while, in anticipation of the occurrence of other similar cases hereafter, to ascertain.

In Professor Seelye's eyes, as appears from his letter, the proceedings against Mr. Galpin are a sort of state trial, a procedure directed against a high officer of state, for the purpose of impeaching and removing him from office. He does not deny that such an officer may be removed, but insists that it must be for cause, and that in the present case no cause is shown. Further than this, the proceedings must be open and similar to those in a trial at law. The accused must be given an opportunity to cross-examine the witnesses, and must be subjected to no surprise nor forced into any admissions. He is to be presumed innocent until the Government proves him guilty. For instance, in his letter to the *Tribune* he complains that the Board of Enquiry on whose findings Mr. Galpin was dismissed was in "secret session for months, receiving during this time all the testimony that could be brought against the chief clerk, and carefully concealing it from him"; he quotes, with an air of triumph, the statement of the Secretary that Mr. Galpin was dismissed "because he admitted in his own sworn statement that he had for nearly two months kept important papers from the head of the Department," as if he had detected Mr. Schurz in the commission of a plain act of illegal oppression, and then, pointing out that the whole matter has now been reduced to "this single issue," proceeds to give what he thinks are the facts of the case, and to demand judgment. These facts, as Mr. Seelye "learned them at the time," were as follows:

"There came into the chief clerk's hands, at a time when the Commissioner was absent, two papers with charges against two Indian agents. One of these agents had been already dismissed, by the complaint of Mr. Galpin himself, on other charges, while Mr. Galpin's information *demonstrated to him that those now presented were untrue*. The charges against the other agent, Mr. Galpin, *whose province it was*, in the absence of the Commissioner, *to decide upon such a matter, deemed it* [*proper*] *should be investigated by one of the three Indian Inspectors who are appointed especially for such services*, but no one of whom was at liberty for this work at that time. The papers were therefore laid aside for the consideration of the Commissioner, on his return. Then came the chief clerk's suspension from his office, and it need hardly surprise one that in the trying position in which he was so suddenly placed he should for a time have forgotten these papers. It was, however, he himself, as I am informed, who, recollecting his omission, then promptly called the attention of the Commissioner to the matter, and what is now proclaimed as 'his admission under oath,' was first brought to the knowledge of the Secretary through his agency. Whether this, which is now on the highest authority declared to be 'the principal reason for his dismissal,' *is a sufficient reason for that dismissal*, and the way in which it was done, others can judge as well as I."

Unfortunately, to begin with, Mr. Seelye's facts are wrong; it was not Mr. Galpin's province in the absence of the Commissioner to decide whether the matter should be investigated or not by "one of the three Indian Inspectors"; it was his duty to report the facts to his superior officer, the Secretary of the Interior, and let him take such action as he saw fit. That Mr. Galpin should have done so is shown by the result, which has been the indictment, not of a single "Indian agent," but of five persons—four contractors and one agent—who had, down to the sudden discovery of the papers implicating them, escaped; and this was brought about without the use of any of the inspectors. Mr. Galpin was undoubtedly dismissed for not bringing these papers to the notice of the Government, the papers being—as appears from Mr. Schurz's published statement—"charges and specifications, supported by numerous affidavits, showing corrupt practices" on the part of Indian agents and contractors; the only defence that he put in himself being, 1st, forgetfulness, and 2d, the somewhat inconsistent plea that "secrecy was essential to any proper action in the matter," as if for the purpose of secrecy it was necessary to conceal the papers from the Secretary himself. It appears from the letter of Mr. Schurz dismissing him that he is not

accused of any dishonesty, but of neglect of his duties in not remembering the existence of important papers in which the Government's interests were at stake. It may be said without hesitation that this is the whole case.

But it will be seen that behind this defence lies the assumption that the whole proceeding has been irregular and arbitrary, and that the removal has been made in a tyrannical way. The explanation of this seems to be that Mr. Schurz has, out of perhaps an excessive desire to be just, assigned causes for Mr. Galpin's dismissal when he was in reality not bound to assign any. The notion that the Secretary of the Interior is bound to "show cause" whenever he removes a clerk—put forward in the interest, too, of "civil-service reform"—is a curious contribution to political science. The Secretary of the Interior, like all the other secretaries, has the right, and it is essential to the discharge of the duties of his office that he should have the right, to remove any of his clerks without assigning any cause, without any formal investigation, without any trial. He may remove him because his handwriting is not good; because his manners are not sufficiently respectful; or even because he is suspected of acts or omissions which cannot be proved, and for many other things which, in the nature of the case, cannot be set down in charges and specifications. Clerks are removed or suspended or reduced every day for just such causes, and it is obvious that if in such a case the clerk had the right to appeal to some tribunal outside, there would be a speedy end to all discipline, or even regular conduct of business, in the department in which such a right was introduced. Even with regard to what are called "Presidential" offices—*i. e.*, those which require the advice and consent of the Senate to confirm them—the Tenure-of-office Act, which compels the President to assign causes of removal to the Senate, has been felt to be a grave impediment to the proper conduct of business; but a tenure-of-office act for department-clerks has never been suggested even by the most zealous reformer. In fact, Mr. Galpin was not entitled to any assignment of cause for his removal, and if Mr. Schurz had taken the ground that he declined to give any reasons, it is difficult to see in what clause of the Constitution or section of the Revised Statutes or verse of Scripture Prof. Seelye would have found authority for a re-examination of the case in the light even of imaginary facts. There is no more resemblance between such a dismissal and a legal prosecution than there is between the process by which a bank gets rid of an unsatisfactory cashier or paying-teller and an impeachment trial—though, it may be added, if there was, Mr. Seelye might have been taken to be lawyer enough to know that the secret sessions of the board of enquiry for the investigation of charges might be very justly compared to the secret sessions of a grand jury, and that if suspected persons had the right of managing inquests of this sort in their own way, intelligent criminals would find even less difficulty than they do now in procuring the proper sort of evidence to meet charges against them. It is a noticeable fact, too, as pointed out by Mr. Schurz in the interview before referred to, that open investigations, which Mr. Seelye seems to think essential to fair play, have hitherto led to nothing, and this too for very obvious reasons. The practice during General Grant's second term was not only to have "open" investigations, but to have boards of investigation selected by the officials implicated; yet even this produced no very satisfactory results.

To sum up the whole matter, Mr. Galpin might have been removed without any cause being given; he was removed because he withheld, or forgot the existence of, papers containing evidence of frauds on the Government, an omission which showed his unfitness for the place, as his honesty in the matter could only be assumed at the expense of his capacity. But although Mr. Schurz has given him the benefit of every doubt, it will not do to assume too much in the past management of Indian affairs. Unfortunately Mr. Galpin has long been known to have intimate relations of a suspicious character with a set of attorneys here active in Indian matters, themselves ex-clerks and discharged from the Bureau for irregular practices.

An examination of the report of the Board of Enquiry shows that the Galpin case covered but a small part of the ground which it went over; the charges against the chief clerk were in reality but an incident in its investigation. The object of the enquiry was a general investigation "concerning irregularities"; and of the sixty-four pages of the report only three are devoted to Mr. Galpin's case. The remainder extended over nearly the whole range of the Indian service, and with the accompanying evidence affords a basis for the important work of reform which Mr. Schurz has undertaken. The state of affairs disclosed by the report shows why the Indian service has become a by-word for maladministration and corruption. It finds that in forty-six years there have been twenty successive Commissioners of Indian Affairs; and that, in accordance with a convenient custom of the Bureau, much of its official correspondence has been marked "personal," and consequently kept from the files of the office, so that frequently important official acts as well as accounts have been "based upon covert understandings reached through such writings"; that "correspondence of a character purely official . . . floated about in an indeterminate way"; that "important papers shown to have been received at the office were frequently reported missing"; that "if a paper in any instance was charged on the books to anybody to whom it was entrusted within the office it was an exception to the general custom, and if enclosures were anywhere accounted for that fact was a surprise"; that the principal clue to an important protest presented in 1876, on behalf of a band of Cherokee Indians, "in the name of the honor of this great nation," containing charges against the chief clerk, appeared to be the recollection of a stenographer who "remembered the paper because it spoke of a certain person in a 'funny way'"; that the late Commissioner swore that he did not see anything in the paper "requiring action"; that the late Commissioner was, according to the testimony of one clerk, in the habit of saying when irregularities were brought to his notice, "Don't tell anybody; don't tell the Secretary; don't say anything about it; and if it is anything before I came here I don't want to know anything about it"; that, according to the evidence of another, he was directed not to report "anything he saw going on in the Bureau outside of his official duties"; that the annuity clerk, who had been in the Bureau for twenty-one years, had received presents of all kinds as well as money from contractors, and that he did not deny the fact, but said that "all this was in the good old times when things were somewhat different from what they are now." The report sums up the whole matter by a declaration which few who read it will be inclined to dispute, that "no bureau or office of the Government has afforded more opportunity for downright irregularity and concealment of fraud than has the management of the Indian Bureau and service." During the recent administration of the office its affairs have been managed by the Commissioner, the chief clerk (who in the Commissioner's absence has acted generally, if not always, in his stead), the stenographer, the correspondence clerk, and the annuity clerk; and it is difficult to believe in the light of such facts as the foregoing that Mr. Galpin was not responsible in great measure for the shocking want of system discovered.

It may not be out of place to add that as a critic of Indian administration Mr. Seelye enjoys here a higher reputation with contractors (on account of an alleged simplicity of character, which exposes him to the wiles of the practised peculator) than with reformers. A curious fact is stated to illustrate this, which I may give you for what it is worth. During the last Administration there was a clerk in the Indian Board named Samuel Walker, who though, like many others, originally an honest man and active in ferreting out frauds, did not make that progress in bettering his fortunes which the just man naturally feels that he ought to make. Accordingly he determined to try other means, and was much more lucky than he had been. In no long time he earned the sum of $10,000, which was deposited to his credit with some Washington bankers, and about the same time he, for reasons best known to himself, determined to try a change of climate, and went to Ireland. Before he left this country, however, he had a correspondence with some Indian contractors, who urged him to use his influence with Speaker Randall and others to secure the appointment of Mr. Seelye on the Indian Committee of the House, on the ground that, in addition to his unquestioned honesty, the peculiarity of the professor's character alluded to above made him an eminently fit person for such service. The letters in question are stated to have been in the possession of the *Herald*, and would furnish, it is said by those who have seen them, interesting reading.

THE OPERA AT NAPLES.

NAPLES, December 20, 1877.

THE first visit to San Carlo is an event in the life of an opera-goer. The marvellous creation of M. Garnier at Paris is more gorgeous; the *mise-en-scène* at Vienna or Berlin or at London is nowadays perhaps finer, and the Music of the Future, and of the present too for that matter, is given to the world from Munich. Still, the great historic opera-house of Europe, the Mecca, the Westminster Abbey, the Plymouth Rock of the musical drama, is San Carlo, the shrine, the storehouse of memories, the centre from which the ruling influences have gone forth. Here—I do not wish to dazzle my readers by too long an array of shining names—Fodor, Catalani, Pasta, and Malibran won their real successes, as did also Tam-

burini, Rubini, and Lablache. All these Alexanders of music had their world to conquer, and the victories which set the seal of pre-eminence upon their brows were won at San Carlo. But for this final triumph in vain had all the rest of Europe acknowledged their supremacy; they must for ever have remained kings and queens of Yvetot, mere fragments and broken lights of royalty. London could never either make or mar a musical reputation; the utmost that her colossal wealth can do is to pay the biggest prices to artists whose fame has already been established by more critical publics. She has bought over many of the kings and queens of San Carlo, who live among the fogs like the Orléans family or the hopeful Lulu, in comfortable but inglorious exile. Their royalty rejoices in slippered ease, while here for one hundred and forty years has been one of the greatest battle-grounds of art, where crowns have always been at stake and he who would win must fight and fight well.

We Americans have been so long accustomed to look upon theatres as rather more combustible than match-factories, that one whose walls have stood for one hundred and forty years assumes the rank of a curiosity in our eyes. San Carlo is a proof of what care may accomplish in a country where furnaces and attendant defective flues are unknown. Not that the theatre has entirely escaped the usual lot of such buildings; it was partially burned in 1816; but in spite of chance and change it is substantially the original theatre which now graces the Largo San Ferdinando. Its history is in brief as follows: It was built in 1737, within two hundred and seventy days, under the third Charles of the Bourbon dynasty. In 1777 the interior was renewed by Ferdinand Fuga in the taste of the period. This interior was restored after the fire of 1816, and a new portico with some new ornaments was added. You see the history of a fortunate building, as of a happy people, is short; but then the meagreness of the chronicle in this respect is a condition of the richness of the romance witnessed by the boxes inside and the precincts of the stage.

Of course a theatre for which Donizetti and Bellini, Cimarosa, Mercadante, Rossini, and I know not how many others have written, may be expected to stand somewhat upon its dignity. It has long been a rule of San Carlo to permit no untried talents upon its boards. This was no arena for novices and tyros; a singer must have won laurels elsewhere in order to be allowed to tempt fortune upon the grander field. The judgment of San Carlo must be final. A success in a dozen cities, Rome even included, does not necessarily secure success here; and, on the other hand, a public which does not ratify the favorable verdict of San Carlo simply in so far proves its own crudeness and barbarity. These are high pretensions, but, high as they are, they have never been lowered. The audience remains as critical as ever, although the palmy days of the theatre are, for the moment at least, over. A despotism, even one so detestable as that which used to exist in Naples, is not an unmixed evil. A court more corrupt, a tyranny more cruel and despicable, has not, at least outside of Turkey, disgraced this century in Europe. The kings of the two Sicilies fairly exhausted the catalogue of political vices, besides often affording a very pretty show of private and personal failings; but they seem, like Nero, to have been fond of music. They improved, however, upon their Roman model: *he* made his courtiers admire his own performances, while *they* gave their capital an opera second to none in the world. The story is nearly as old as misrule, and is more or less bound up with that. The king allowed San Carlo from his own purse 350,000 francs a year—that is, when he had the money; and when he had none, why, he must at least have the opera, and he had it as kings in the good old days used to have things they could not pay for. Among the expedients of the early part of this century tables for faro and rouge-et-noir were set up in the great halls belonging to San Carlo. As usual, the chances were in favor of the bank, and the bank was generous to the theatre. So by hook or by crook the lyric drama flourished while the country was going to wrack and ruin. And such a country as it was for kings to exercise their divine rights upon! A land so endowed by nature that human lives expand in it like flowers under the sunlight, and where happiness and beauty would be universal were it not for that "screw loose somewhere" that everywhere deranges the action of things terrestrial. As for music, men sing here as the birds do, because they must; and their throats are so constituted that it is nearly as difficult for them to sing out of tune as it would be for a bobolink. Now, as these people are also gifted with a southern love for colors and pretty shows, the Ferdinands and Francises of evil memory had an easy task when they wanted to maintain the supremacy of their opera-house. It should be remembered, by the way, that Naples has been as rich in composers as in fine voices. We are occupied with other music nowadays, but Alessandro Stradella, Salvator Rosa (good composer as well as painter), Scarlatti, Porpora, Durante, Paisiello, Pergolesi, and Cimarosa are still splendid names, and they were all Neapolitan. According to the custom of Italian theatres, San Carlo has always had its composer, who is bound, as a rule, to furnish for it two operas a year. Most of these are soon forgotten; even in the case of Rossini, who, in his seven years at Naples, produced eighteen operas and two cantatas, only four still keep the stage: "Il Barbiere," "La Cenerentola," "La Gazza Ladra," and "Mosè in Egitto"; but such fruitfulness is possible only in a country where music is a living art and not a mere luxury of the rich.

I have intimated that the present days are not so happy for San Carlo as the past. A free and united Italy has had so much use for her money that she has not always been able to spare the sums required by so magnificent an amusement, and there are now no faro-tables kindly to take the burden off the hands of the state. San Carlo has on occasion even been closed for want of subvention—an event which must always be a real affliction in such a city as Naples. Moreover, though fine voices will never be wanting in this favored land, the best artists go where they can get the best prices—to London, to Paris, and St. Petersburg; and as for composers, we can only say that it is a bad season for the race in Italy.

Nevertheless, San Carlo has now its subvention—only 100,000 francs; better than none—I have been told, and the singing people sing such music as is written for them. In accordance with these conditions we determined a few days ago to hear "Il Guarany," a year-old opera of the "Maestro Gomez." It was an opportunity not only to see the theatre but to enlighten our utter ignorance as to the abilities of the Maestro Gomez. I won the right of saying that in this case ignorance was bliss, and that it is a mercy for the hearers of Italian opera in other countries that a sort of sifting process goes on in the land of their production, so that the choice of outsiders lies between a few of the better ones only. "Il Guarany" purports to be a romance of Brazilian life in the sixteenth century, and in its utter defiance of all trammels of reason and probability it might rank with the highest efforts of the Italian lyric drama. Unfortunately it can make no other pretensions to greatness, and demands attention only during two or three pretty airs and choruses. There was abundant leisure for studying the house and the audience.

It remains an open question whether San Carlo or La Scala at Milan be the greater theatre. Figures on each side stand in audacious contradiction to each other. In any case, the auditorium of either has but one rival in the world in point of size, and that is the other. Some captious critic had prepared me to expect little in the interior but dirt and shabbiness, and in the audience nothing but a lot of human magpies, who habitually drowned the music by their chattering, and reserved their attention exclusively for the ballet. Poor dyspeptic critic! The hall of San Carlo certainly does not afford a model of purity of decoration. It is easy in this year of grace to see that the taste of the eighteenth century was vicious, especially for such people as believe that the hats of the present season are intrinsically more elegant than those of the last. Whatever may be its defects, San Carlo has eminently the air of a meeting-place for good society; there is something stately, courtly, grandiose about it which makes it compare with a modern theatre as a gentleman of the old school with a smart young shopman. The light is not too glaring, and the six tiers of boxes, all lined with deep red, form an excellent setting to the toilettes and faces therein displayed.

As for the attention of the audience, the criticism referred to above was based, I fear, on a misunderstanding of the conditions of Italian theatre-going. People who hear an opera but seldom generally have eyes and ears only for the stage whenever they take the trouble to visit the theatre. In Italy, however, the theatre is the place where society habitually assembles. Everybody accordingly soon learns a given opera by heart from beginning to end. The young men in the pit hum an accompaniment to the favorite airs sung on the stage. Their voices are so sweet and true that the effect is not disturbing, excepting when they serve to set in relief the occasional lapses from purity of intonation of the prima donna or the tenor. But though they may have heard the same music fifty times they never fail to detect instantly when anything is done upon the stage either better or worse than usual, and they mete out rewards and punishments with swiftness, and generally with justice. The attention given to "Il Guarany" was much better than the work deserved, better than we are in the habit of according in our social gatherings to the persons who are obliging enough to furnish us with "a little music"; here, for instance, the conversation did not prevent the audience from knowing just how every note was given on the stage or in the orchestra.

For the rest, the boxes are so many reception rooms; in the first two tiers every one is in evening dress. The Englishmen and Americans who

think that a shooting-jacket is fine enough for a Continental theatre would find themselves unpleasantly conspicuous in a good part of San Carlo. Up above, in the fifth tier, next to a box where is a large family all in their Sunday best, are workmen in blouses and shirt-sleeves. In those dizzy regions, where the pleasures and the obligations of wealth are alike unknown, the music and the spectacle are all in all. Southern enthusiasm and southern demonstrativeness are here held in check by no conventions, and accordingly both delight and discontent here assume the proportions of a storm, which now and then breaks out and fills the house with its roar. In the lower tiers all is, of course, highly decorous. I searched here long in vain for one of those sweet and beautiful faces so common among the youth of Naples. The search was finally rewarded; but there were proportionally far too many faces jaded and faded before their time, marked with the peculiar melancholy that comes from satiety and wasted energies. We see enough of such faces in Paris or New York, but I never have remarked so many elsewhere as among the fashionable women of Naples. The expression of the men is more varying and intellectual; one feels that they, at least, would be easily roused to a show of interest.

In spite of the frost that numbs the faculties of a portion of the audience, its prevailing tone is sensitively, perhaps I should add sensuously, critical. A single false note was greeted with groans and hisses. On a later occasion I saw the opera of "Norma" come to an untimely end on account of the shortcomings of the tenor who sang the part of *Pollione*. The poor man was one who would have been endured, if not admired, in certain cities that I could name, but here the storm began soon after his first appearance and raged more and more furiously, until at the end of the first act the opera gave way to the ballet of "Rolla." I was in a box with some English people who felt cheated of their money's worth by this change; a Neapolitan would have felt insulted by any attempt to make him listen further to the false notes of the illustrious tenor.

This same sensitiveness may crop out in a whimsical injustice, as on the occasion of Rossini's bringing out his "Donna del Lago." The tenor who personated *Roderick Dhu* unfortunately pitched his first note, on entering the stage at a great distance from the orchestra, too low. The mistake was greeted by a general yell. As Stendhal says, who recounts the scene: "Nothing can convey an adequate idea of the fury of a Neapolitan public when offended by a false note." The tenor was followed by a chorus of bards accompanied by a splendid military march. It was a gala representation, and the court happened not to be present to impose decorum. There were a number of young officers, animated by military spirits, in the pit, and at the first sound of trumpets one of these began with his cane to imitate the gallop of a horse. Instantly the pit was filled with five hundred similarly improvised steeds, and the opera was brought to an end amidst a frightful clatter. It may be worth noting that Rossini, who the same night set off in mortification to keep an engagement in Milan, told everybody along the road that the "Donna del Lago" had been cheered to the skies, "*était allée aux nues.*" The fib was one only in intention. The next night the public, ashamed of its treatment of such a work, amply verified Rossini's account.

This was not the only time when Rossini extorted the applause of the same audience against expectation. "Moses in Egypt," as first written for San Carlo, was without the magnificent prayer. The present climax of the third act and the contrivance of the theatrical machinist to represent the passage of the Red Sea was such that it never failed to excite mirth. The opera reached its second season, a success on the whole, but still having to contend against ridicule in the one critical point. Rossini was one day lounging in bed with a dozen friends about him, when in rushed the poet of the libretto, who cried, without noticing the company: "Maestro! I have saved the third act!" In reply to Rossini's amused and sceptical question as to how he had accomplished the impossible, "I have made a prayer for the Hebrews before the passage of the Red Sea," said the poet, thrusting a mass of papers upon the bed. While Rossini was engaged in reading, the excited poet kept constantly whispering, "Maestro, I did it in an hour," until the composer finally cried, "Well, if you have done this in an hour, I must write the music in a quarter of the time," and jumping out of bed, sat down just as he was and actually wrote out this magnificent number in eight or ten minutes amidst the talk of his friends. The next evening when the usual fun was beginning it was at once repressed by the introduction of the new music. As the prayer went on the attention became breathless, until at the end, says Stendhal, "It would be difficult to give an idea of the thunders of applause which resounded from every part of the theatre. The spectators leaned over the boxes to applaud, exclaiming, '*Bello! bello! O che bello!*' Never did I behold such an excitement, rendered still more striking by its contrast with the previous merry mood of the audience."

Since writing the above I have been a third time at San Carlo, and by good fortune was with about a dozen Neapolitan officers, who did the honors of their box with the charming courtesy of their nation. Let it not, therefore, be set down to prejudice if I say that the result of this third experience has been to confirm in a most decided manner my previous conclusion, that there can be no public in the world more quick and more certain in musical judgment. It is as easy now to understand why South Italy should have been the home of Italian opera as to see why Greece was once great in sculpture, or Venice in painting, or why constitutional government has flourished in England.

Correspondence.

AMERICAN MEMBERS OF THE ROYAL SOCIETY.

To the Editor of The Nation:

Sir: On page 42 of the *Nation* for January 17 I read: "Professor Simon Newcomb has been elected a foreign member of the Royal Society of London, an honor hitherto enjoyed by Dr. Asa Gray alone among living Americans." The latter half of this statement is totally untrue, as you can readily satisfy yourself by consulting the list of foreign members of the society, among whom Prof. Benj. F. Peirce, of Cambridge, Mass., has long held a place.

It would not have been worth while to notice this matter were it not that for years past the newspapers have contained numerous items respecting Prof. Newcomb, most of which were as erroneous as the one just quoted.

Very respectfully,

Wm. Harkness.

Washington, January 19, 1878.

[Our authority was *Nature*, in which we found the statement.—Ed. Nation.]

JUDGE DILLON AND THE DEFAULTING CITIES AND COUNTIES.

To the Editor of The Nation:

Sir: The following report of the remarks of Judge Dillon in a recent case is taken from a Kansas paper:

"Several suits against counties and cities in Kansas, loaded down with debts they cannot possibly pay, came before the United States Circuit Court, Judge Dillon presiding, at its late term. No defence was made. The defaulting municipalities, as a rule, do not deny the validity of their debt, but assert that they are unable to pay in full and ask a compromise. Judgment was rendered against them by default. The attorneys representing the bondholders then asked the judge to issue a mandamus compelling the municipalities to levy a tax to pay the interest. Judge Dillon, replying to this demand, made an earnest and logical address, in which he discussed the subject at some length. He said he would decline issuing a mandamus at this term of court, and he earnestly hoped that the bondholders would, before the next term, accept any reasonable compromise offered by the municipalities. Whenever, he said, a county or city has bonds outstanding to the amount of more than ten per cent. of its assessed property valuation and bearing a high rate of interest, it was impossible for that community to meet its obligations and survive. It was an unfortunate condition of affairs for both parties interested, and the difficulty ought to be adjusted by mutual concessions. He hoped the attorneys representing the bondholders would represent the truth concerning the condition of the defaulting municipalities to their clients, and urge them, whenever a reasonable compromise was offered, to accept it. He believed that the municipalities would pay if they could, but when a municipal debt was so large that to attempt to pay it would involve the community in financial ruin, it was manifestly in the interest of its creditors to accept a reasonable compromise. He had never known a municipal debt thus compromised to be dishonored, and he hoped that before the next term of court some fair understanding between the parties in interest would be arrived at."

It is barely possible that this report of the judge's remarks does him some injustice; but it is not likely. The principal points in the report—that the validity of the debt was not denied, that the judge refused to issue the mandamus, and declared that "he earnestly hoped the bondholders would, before the next term, accept any reasonable compromise offered by the municipalities"—stand out prominently, and would hardly have been misrepresented to his injury by a friendly and sympathetic journal.

Yet it is difficult to understand how a Federal judge could hold such language on the bench and retain his position. One of the objects the

framers of the Constitution had in establishing a Federal judiciary was that a tribunal might be secured which would be independent of and lifted above the local prejudices and passions which might exercise an undue influence on a county or State court and thereby defeat the ends of justice. In this case, at least, the worthy purpose they had has been disappointed, and we have a Federal judge who openly and officially panders to the worst local influence that can exist in any country.

It must have been known to Judge Dillon that the property in Western cities and counties is rarely ever assessed at an amount over one-third of its real value, and that few if any of the Kansas municipalities have contracted debts which they cannot pay in full if they will honestly try. The compromise which has been offered to the bondholders, in most if not in all the cases, has been fifty per cent. on the face value of the bonds. Nor do they propose to pay this amount in lawful currency, but it is to be represented by new bonds at a reduced rate of interest. In other words, they propose to pay in a currency which they have already repudiated, without giving one additional guarantee that the new contract will not share the same fate as the old.

The obligations were generally incurred for the construction of railroads or other highways, or to promote other local improvements. The expected consideration has been fully realized. The resources of the State have been developed ; access to market has been facilitated ; immigration has been attracted ; counties and cities have been improved and the lands of Kansas thereby greatly enhanced in value. Yet they refuse to return the money which investors loaned them to secure these advantages, and a Federal judge, whose sworn duty it is to enforce every lawful contract, encourages and confirms them in their disgraceful determination. They invite capital, yet they would annihilate credit, which constitutes a great part of the capital of all well-regulated communities. Bacon somewhere says that "a popular judge will be a deformed thing," and if this is true it seems that Judge Dillon is ambitious to become a monstrosity.

Middlesex Co., Va., January 15, 1878.

WESTERN MORALS AND EASTERN VITUPERATION.

To the Editor of The Nation :

Sir : You will, perhaps, be willing to print, as an item of news undiscovered by your contemporaries, the fact that the West is not peopled entirely by thieves. It is time that a protest should be recorded against the indiscriminate abuse of every one who lives in the Mississippi Valley. As one of the great number of Western men who believe in the single gold standard, and who find their attempts to make converts seriously hindered by the daily volleys of vituperation from the press of New York City, I venture to ask you to record that protest. The number of thieves to the square mile in Illinois is not to be found by dividing the total population by the number of square miles in the State. The persons who are dishonestly urging the remonetization of the silver dollar form an insignificant fraction of the silver party. That party is made up of five classes. There are the enthusiastic speculators, led in this city by the "seven millionaires" who telegraphed Logan in 1874 that the West needed "more money," and immediately proved this to be true in their own cases by going into such depths of bankruptcy that their creditors would be glad to take a silver dime for each dollar they owe. There are the demagogues. There are the men who have given mortgages, most of them dated before demonetization ; whose rents do not now pay interest and taxes ; who think remonetization would double their income without diminishing that of anybody else. This third class is not consciously dishonest. The fourth and fifth form, I think, the great mass of the silver party : they are the men who believe silver was fraudulently demonetized, and wish to rebuke the "trick," and the men who have been maddened by the grossness of the abuse poured upon the West for its temporary insanity on this question. Western papers are not behindhand in this vulgarity of vituperation ; but if the gold cause is right, let us carry on the fight with reason, not abuse.

If my analysis of the silver party is approximately correct, it shows the folly of our fighting on the vituperative plan. Calling names, however advantageous in economizing editorial brains, is not argument ; and argument is what is wanted. The most telling thing on our side, so far, has been the *Nation's* editorial on the details of the passage of the act of 1873. That candid statement of fact was worth more in removing the belief that demonetization was fraudulent than a hundred issues of every newspaper in New York City, with each line devoted to the shibboleth of to-day : "The West is a den of thieves."

The danger of paying the bonds in silver is so extremely remote that discussion should be bent upon the dangerous effects of remonetization upon the trade and production of the country. And the argument of expediency will be more effective than that of morality. It is certainly strong enough.

A deeper danger lurks beneath this present one. Thoughtful men must see that the hold of the Union upon the West is weakening. There is no immediate danger of disruption, of course ; but there was no immediate danger of it in New England in 1800 or at the South in 1850. The same class of demagogues who have so skilfully utilized, for their own political benefit, the American hatred of England, are using to-day the Western dislike of the East. The wedge has been driven in a little way. New York is striking heavy blows upon it.

The people of the United States are sitting as a jury upon the silver question. The metropolitan newspapers appear before them as lawyers, not judges. And no lawyer ever won his case when he began by abusing the jury. Yours, etc.,

Alfred B. Mason.

Chicago, Ill., January 17, 1878.

[There is, of course, a great deal of force in what Mr. Mason says as to the uselessness of vituperation. It will probably do no good. But is it inexcusable on the part of the Eastern press? The question, Who began it? of course seems a little puerile ; but it is, in view of the importance Mr. Mason attaches to the mode of discussing the silver matter, worth asking and answering. There is, in so far as our knowledge goes, no feeling or thought of hostility at the East to a bimetallist or remonetizationist as such. With such men as Cernuschi or Dana Horton or Ernest Seyd every one is willing to listen respectfully and answer them calmly. But we must remind Mr. Mason that the advocacy of remonetization opened at the West with the charge that the demonetization of silver had been brought about by a conspiracy of bondholders and speculators, by which some Congressmen were corrupted and the remainder deceived into passing the measure, and that those of us who in the press and elsewhere denied this, and approved of the demonetization and of the single gold standard, were hired by them or in connivance with them in the perpetration of a "trick" or fraud. This story is to all men of intelligence at the East so ridiculous on its face that if it had simply obtained circulation among the farmers, who have little knowledge of the world and are very suspicious of money-changers and Congressmen, it would probably have passed without notice. But when it was taken up and spread as literally true by the best portion of the Western press—by such papers as the Chicago *Tribune* and Cincinnati *Commercial*—by men who know the world, who know that the leading commercial nations have, after mature consideration, adopted the gold standard or are going to do so, and that there is no necessary dishonesty in monometallism, is it surprising that people here got angry, and, knowing these men not to be fools, gave hot expression to the belief that they were something else? Mr. Mason is good enough to say that our article on the details of the passage of the Act of 1873 has been more useful than anything else in exploding the fraud theory ; but does he perceive clearly the force of this admission? The *Nation* went to no recondite sources for its information. It simply consulted the *Congressional Record*. Consider the position in which this fact places the Western editors and orators who have been preaching the fraud theory. What are we to say of the public teachers who kept back the facts produced by the *Nation*? What of the intelligent Westerners of all classes who went on degrading their country by this account of the credulity and corruption of Congress, and vilifying the public creditor or listening to vilification of him, without ever looking at the official report of what had taken place? Is it not a little difficult for the natural man to be polite to adversaries of this kind?

There is no denying that there is a widespread and growing feeling at the East that Western morals are in a bad way, and it is intensified by the fact that the West is a large borrower of Eastern money. Creditors, of course, are always very sensitive, perhaps unduly, about a debtor's character, and when alarmed are not apt to keep silent or find excuses for him. Nothing has done

more to increase and spread this alarm than the conduct of prominent Western men. Messrs. Medill and Halstead, for instance, are well known here. We all supposed them to be shrewd, able, honorable, familiar with affairs, and especially with the laws, conditions, and motives of trade and commerce. Many of us have acted with them in political matters, and supposed them to be rational, cool politicians of the Anglo-Saxon type. It is, therefore, impossible to overrate the surprise and anxiety caused by finding them spreading and pretending to believe the fraud story, and denouncing all bondholders and monometallists with the fiercest vituperation, and representing the commercial world of Europe and the East as a gang of sharpers who made fortunes by imposing on the simple-minded, and all this with extraordinary vehemence and with the gestures and epithets of a Parisian Red in full Commune. No prudent man likes to deal with a community which can be wrought on by influences of this kind, and but few men are calm enough to avoid expressing themselves strongly about open avowals of what they consider an attempt to cheat. Of course the West can punish its critics by not paying its debts, or by trying to dissolve the Union; but would it ever get a chance to treat any other creditors in the same way? Is there any other community on the globe as much in need of credit, and ought it not, therefore, to consider sobriety, fair dealing, and rigid fulfilment of contracts as part of its capital—to put the matter on the lowest ground? The West must make up its mind that it cannot set up a standard of morality of its own, and that there is no escape on this earth, whether by dissolution of the Union or otherwise, from the reprobation of the civilized world for men who seek, or seem to seek, the legalization of fraud.—Ed. Nation.]

THE WAY TO RESUME.

To the Editor of The Nation:

Sir: Is there not a sense in which it is true that "the way to resume is to resume"? It is alleged that we cannot resume without a *quantum sufficit* of gold, and that we have not that *quantum sufficit*. Granted. But if it be true that we cannot use gold until we have it, is it not equally true that we cannot have gold until we use it? Gold flows from countries where it is not used to countries where it is used. It goes where the demand is, and it goes in proportion to the demand.

Since the suspension of specie payments gold has continued to be used in the United States for certain purposes; it is this limited use of gold that has kept in the country the limited amount of gold we have. The legal-tender act is as much the law of the land in California as in New York; but by the force of public opinion in California gold was retained in use. People continued to reckon in gold, to bargain in gold, to pay in gold. They continued to *use* gold, and gold sufficient for their use remained with them.

It will not do to say that California is a gold-producing State, and therefore was able to retain gold. That gold was a native product might account for the state of public opinion, but did not further enter into the question. If California had abandoned the use of gold, every dollar of her product would have gone abroad; just as, if she abandoned the use of wheat, every bushel of her wheat would be exported. It is as easy to get gold by importation as by mining. In either case you must pay the price. Why cannot the State of New York do what the State of California has done?

There is, I think, a growing disposition to do business on a gold basis. Railways pay their bonds in gold; mortagees stipulate for gold; banks receive gold deposits, and pay them out on checks. The practice may extend to all branches of business. Insurance companies may issue gold policies for gold premiums. The State, paying its debt in gold, may levy its taxes in gold, on a gold valuation. The increased use of gold would, by increasing the demand, raise the price, as measured in greenbacks. But as the increased use would come about gradually, the rise of the premium would be gradual, and the resulting disturbance of values would be easily adjusted.

There is no commodity a demand for which can be more promptly supplied than gold. We are bartering our enormous exports in all the markets of the world for things we need. If we need gold we can buy it with our exports. We should obtain it, not by requiring the banks to hoard it, or the Government to buy it with bonds. We should buy it for ourselves, and as we buy sugar, and tea, and coffee, and silk. Thus the use of gold, and the gold to use, would come in *pari passu*. We should resume, not on a certain day of a certain year, but gradually; not by act of Congress, but by the common consent and action of the people.

Is it not true, then, that "the way to resume is to resume," in the sense indicated? Querist.

New York, January 15, 1878.

ANOTHER VICTIM OF RESUMPTION.

To the Editor of The Nation:

Sir: My subscription expires with the issue just received. You will please discontinue. The financial policy which you have advocated has made me too poor to indulge in such expensive luxuries.

Very truly yours, J. E. Downey.

Indianapolis, January 16, 1878.

A FAIR QUESTION.

To the Editor of The Nation:

Sir: It has occurred to me that the advocates of the ancestral dollar overlook this stumbling-block in the path of their argument. They assert that the 412½-grain silver coin should be a dollar now, because, being a dollar when the debt was contracted, it would have continued to be one down to these days had there been no suspension of specie payments. In 1853 (it was, I think?), gold having been cheapened by the California discoveries, it is conceded the silver dollar disappeared, and the subsidiary silver coin had to be debased in order to keep it in circulation. Supposing no suspension to have taken place in specie payments, can it be doubted that when the fall in silver occurred the silver dollar (supposed to be in circulation) would have been appreciated in fineness to fit the gold dollar, just as the silver coin in 1853 was debased to balance the gold coin? Or would the silver-men deem it wiser to debase the gold to fit the fallen silver unit? There could have been no alternative between this course and the melting-pot.

Respectfully, "A Western Shylock."

Cincinnati, January 19, 1878.

CALIFORNIA'S CURRENCY EXPERIENCE.

To the Editor of The Nation:

Sir: The plan proposed by a correspondent, Mr. Fred. P. Powers, in the *Nation* of Dec. 6, of recognizing gold as a standard and of receiving silver at its market value, is in practical operation in California, at least in a modified form; instead of receiving subsidiary silver at its bullion value its price is fixed by the local operation of the law of supply and demand. When the Government commenced redeeming fractional currency (then worth 90 to 91 cents on this coast), silver coin was current at about one per centum discount—*i.e.*, was worth 98¼ or 99 cents. Of course it flowed hither in large quantities, and, as a consequence, we have been annoyed with a redundancy of it ever since. Its current or local value, in quantities, has ranged, during the period mentioned, from 93 to 96½ cents, although its value as bullion has not varied greatly from 85 cents.

The same principle, of recognizing unity of standard based on a single metal, and of gauging the various other money measures (including tokens or counters, etc.) that may be current by that standard, has been observed in this State during the long paper-money era that has prevailed east of the Rocky Mountains since '61. Our refusal to adopt the illusory and ever-changing (because irredeemable) paper standard of value, elsewhere prevalent, during and since the war, has been frequently and sharply criticised as unpatriotic, illogical, etc. I deny the justice of the criticism. On the contrary, Californians, with a liberality and a regard for realities rather than semblances that they have hardly received sufficient credit for, have always been willing to receive without hesitation, *at their market value*, greenbacks, national-bank notes, subsidiary silver coin, "the dollar of the fathers" (whenever obtainable), trade-dollars, and even gold and silver bullion, etc.; believing meanwhile, by a sort of intuition that seemed to be fortified by the experience of mankind, that gold (which they had inherited as a standard) was, take it all in all, about as good a measure of general values as could be found, because it was a commodity of absolutely universal currency, and of nearly uniform value throughout the world; but anyhow that *unity and unchangeableness of standard* were as essentially bed-rock principles in dollar measures as in gallon measures or yard measures or pound measures.

Our experience in this matter of standards, on this coast, has probably

not been materially different from that of most other gold and silver countries; but there are one or two phases of it bearing on questions now mooted, in and out of Congress, that may possibly interest the readers of the *Nation*. And first, as to our experience with a better silver dollar than "the dollar of the fathers." Unless the silver-men are prepared to go over in a body to the silver standard, and to see gold disappear from circulation and flee the country, we can tell them just how unlimited legal tender (or even limited legal tender) with free coinage of the "silver dollar of the fathers" will operate. That dollar contains 412½ grains of silver. The trade-dollar contains just 7½ grains more, or 420 grains. Now, as the price of silver bullion since 1875 has depreciated throughout the world, and as bullion dealers, a year or so ago, were willing and anxious to sell from 450 to 460 grains, or nearly an ounce, of silver for a dollar, free coinage of trade-dollars afforded them fine opportunity, which they were not slow to seize, of having their merchandise converted into dollars of 420 grains, which, though only worth from 90 to 93 cents, they could pass on a confiding community, for awhile at least, for 100 cents, or at their face value. As silver was plenty in other countries as well as in California, and as the market for it was dull, this neat little game went on for some time in a lively manner; in fact, business was exceedingly brisk with the bullion dealers, till finally trade-dollars became so redundant in our currency that they were unanimously voted a nuisance. Being overvalued, the banks refused to take them except on special deposit; debts could not be paid with them at par without a hitch or a wrangle, and as our people did not propose to give up gold as money altogether, they finally, by general consent, agreed that they would only receive trade-dollars at 90 cents, and this understanding they proceeded to put in practice. That settled the question: 90 cents being a slight undervaluation, they soon disappeared—sought a more congenial clime (in China and India, and lately, I believe, in the Western States), and we have not been bothered with them since. Moreover, we have found in practice that two half-dollars are often more useful as change-money than a trade-dollar, notwithstanding the fact that they contain nearly 35 grains less silver than a trade-dollar.

Mr. Thurlow Weed and others suggest, on the other hand, that enough metal should be put into the silver dollar to make it equal in value to the gold dollar, or to its own former value before the general fall of silver throughout the world. But suppose, after the country's necessities had been supplied with coins adjusted on such a basis, that silver should appreciate again to something like its former price, so that the new dollar would be worth, say, $1 08 to $1 10; what would then happen? Why, such dollars, being only a legal tender for 100 cents, would be worth more as bullion than as coin, and straight into the melting-pot they would go—precisely as their predecessors (of lugubrious memory), the "dollars of the fathers," did, nearly as fast as they could be coined, so long as they were worth 102 to 103 cents. This accounts for the fact that those venerated coins never circulated to any great extent alongside of the gold dollar as a standard; and for change purposes, the smaller or fractional silver coins were more useful, because, though intrinsically less valuable, they better performed the function for which they were created.

Another point which the people of this State have learned from experience, and which has been a source of considerable irritation, is, that where several currencies of slightly dissimilar value circulate together, there will exist an irrepressible tendency among the people to insist that the par of one shall be the par of another. This was especially noticeable when greenbacks, soon after they were first issued, began to diverge or to depreciate from the gold standard; and also lately as they begin to approximate again to that standard. But when they were worth, say 50 cents (or, as you Eastern people put it, gold was at 200), or 37½ cents (gold 285), nobody thought of confounding the par of a specie or standard dollar with that of a greenback dollar. So that really there is less friction, paradox though it may seem, in doing business in any community when the difference (if any exists) between the several currencies is so great that all disposition to substitute the various false or delusive standards for the true one disappears, and all with one accord assent to the doctrine, that though there may be currencies many, there must be but *one standard*.

Again, instead of limiting the legal tender of silver arbitrarily to $5 on all payments, as required by the present law, the practice has been somewhat generally prevalent in California of receiving a small percentage of entire payments in silver under what seems a juster rule than the former one. This practice has suggested to the writer the feasibility of a plan of making silver coin and gold coin together a legal tender in the payment of all debts to an extent approximating to their *proportionate* value to each other—say 95 per cent. in gold coin and 5 per cent. in silver coin—thus evolving a *composite* single standard from a bi-metallic basis. At the ratio of 16 to 1, gold is 16 times as valuable as silver; or, silver, expressed in hundredths, is just 6¼ per cent. as valuable as gold. The ratio of 95 per cent. to 5 per cent—or, of 95 cents to 5 cents—is as 19 to 1, and 1 is about 5¼ per cent. of 19. If, as Mr. Murat Halstead insists and as many others believe, the presence of silver in the standard is a question of vast importance to the American people, I can conceive of no theory by which it can be realized, or that in practice would work more justly, than that of making it a legal tender with gold in proportion to its relative value to gold (say 5 per cent. and 95 per cent. equal 100 per cent.), the two intrinsic metals, thus together, in separate, full-weight coins, forming a composite single monetary standard. If by such a plan, or any plan, absolute unity of standard is attainable the feasibility of its adoption might be worthy of consideration. But the sooner the American people abandon all thoughts of trying to measure values by two full and independent standards in the same system, based on two divergent, perpetually oscillating commodities, whether they be gold and silver, or wheat and corn, or flour and bran, the sooner will they rescue their monetary system from the domain of chaos and confusion. An ounce and a pound avoirdupois, as dual units of weight, are always true to each other as 1 to 16. The ratio of value of an ounce of silver to an ounce of gold *may* be as 1 to 16; it has sometimes been as 1 to 14. It is now about as 1 to 17.7.

HENRY D. BARROWS.

LOS ANGELES, CALIFORNIA, January 8, 1878.

Notes.

A NEW New-England novel, by Mrs. Stowe, is announced by Fords, Howard & Hulbert, of this city. It will be entitled 'Poganuc People.'——The venerable Col. John H. Wheeler, author of 'Historical Sketches of North Carolina, 1584–1851,' first published in the latter year, is contemplating a new edition of this work, with revisions and additions to the present date.——The daughters of the late Richard Cobden are now collecting and arranging his correspondence, with a view to its early publication. They will feel obliged if any one possessing letters from him that ought to be included will send them to Mr. T. B. Potter, M.P., Reform Club Chambers, 105 Pall Mall, London, S.W.——The London *Athenæum* of Jan. 5 prints a gossipy letter from Dr. Doran in celebration of its fiftieth birthday (Jan. 2, 1828–78). In the same number Mr. Wm. Chappell asserts for Wheatstone the honor of first discovering the principle of the telephone.——J. B. Lippincott & Co. have published an English version of Letourneau's 'Biologie,' reviewed by us in No. 554.——D. Appleton & Co. have just issued a translation of Gobineau's 'Nouvelles Asiatiques' (see the *Nation*, No. 597), under the title of 'Romances of the East.' The same house have in press Lecky's 'History of England in the Eighteenth Century'; the third volume of Martin's 'Life of the Prince Consort'; Prof. Corfield's 'Hygiene and the Laws of Health'; Huxley's 'Anatomy of the Invertebrates,' and 'Physiography'; 'The Source of Muscular Power,' by Dr. Austin Flint, jr.; a 'Life of Gen. Albert Sidney Johnston,' by Wm. Preston Johnston; 'The Military Policy of the United States' and 'The Armies of Asia and Europe,' by Gen. Emory Upton; and a guide-book for the Pacific Railways and Colorado.——'The Life and Military Services of Gen. Wm. Selby Harney,' by L. U. Reavis, is announced by Bryan, Brand & Co., St. Louis.——The Eleventh Annual Exhibition of the American Water-Color Society will open in this city at the National Academy of Design on February 4 and close on March 4.——From Chicago there comes to us a German metrical translation of Longfellow's "Morituri Salutamus," by Dr. Ernst Schmidt.——The January number of the *Geographical Magazine* contains a new language-map of India and its border-lands, illustrating two papers on the subject, the second of which will appear next month.——We begin to share the impatience of Dr. Hugo Schramm-Macdonald, the unappreciated editor of *Die Urne*, who was annoyed by the uncertainty of the dates of death of distinguished men. We are informed that Mr. F. B. Meek died December 21, 1876, contrary to our necrological assumption that he died last year.——1876 was the year of the Papal jubilee, and it witnessed an extraordinary revival in miracles and pilgrimages, which called forth in that one year between two and three hundred special publications. A bibliography of these has been published at Turin in French, and it affords very curious reading. With an irony probably intentional the cataloguer has included in the same pamphlet a list of the publications during the same year on

prestidigitation and spiritualism. The lawsuit about "spirit photographs" during that year in Paris was the exciting cause of nearly as many pamphlets as the Papal jubilee.——We have received the first number (Jan. 6) of an Italian *Spectator* or *Saturday Review*, published at Florence, *La Rassegna Settimanale di Politica, Scienze, Lettere ed Arti*. It is a very handsome sheet of twenty pages, 4to, and is conducted by Leopoldo Franchetti and Sidney Sonnino, with a large corps of eminent contributors, who will all, we judge, be anonymous except the poets—Carducci leading off with two ballad versions from the Spanish and Danish. Other well-known names on the list of promisors are Bonghi, Cambray-Digny, De Amicis, Errera, Gallenga, Guerzoni, Hillebrand, Mme. White-Mario, Negri, Scila, Villari, etc., etc. The *Rassegna* announces that Bonghi's "Pio IX." has met with so much success that the publishers Treves have engaged him to write a life of the Pope. He will also make a volume of his already published contemporary portraits of Cavour, Bismarck, and Thiers.

—There is much good reading and some fine engraving in *Scribner's Monthly* for February, the greatest novelty being perhaps Mary Hallock Foote's "California Mining Camp"—a long article, for which the author herself furnished the numerous and attractive illustrations. There is a charming design for one of Mr. Boyesen's ballads, by Mr. John La Farge, admirably interpreted on wood by Mr. Henry Marsh. Striking, too, and apparently faithful, is the copy of what is supposed to have been the last photograph of Abraham Lincoln, with its genial rather than melancholy expression, and its homely humanity. Lincoln is the subject, further on, of personal reminiscences by an intimate acquaintance, Mr. Noah Brooks, who keeps some in reserve for a subsequent paper. New to us in them is the account of the composition of the Gettysburg speech, which, as it appears, had been already conceived before the President obtained Mr. Everett's oration as printed in advance in the Boston *Journal*. Lincoln took the *Journal* with him to the photographer's where he sat for the likeness above mentioned, and on being asked by Mr. Brooks if his discourse was written, replied, "Well, no. It is not exactly written. It is not finished, any way. I have written it over, two or three times, and I shall have to give it another lick before I am satisfied. But it is short, short, short." As characteristic is this other remark, on a different occasion: "With educated people, I suppose, punctuation is a matter of rule; with me it is a matter of feeling. But I must say that I have a great respect for the semi-colon: it's a very useful little chap." Mr. Brooks's reminiscences close with Lincoln telegraphing to recall the Californian Representatives who had left Washington "angry because the San Francisco mint and custom-house appointments were agreed on without their consent." Secretary Chase had, in fact, undertaken to fill these offices without consulting either them or the President. When the Representatives returned, "the Treasury Department 'slate' was broken." The world has moved a little since then. We can say no more of the present number of *Scribner's* except to mention Mr. Charles F. Thwing's paper on "The College Rank of Distinguished Men," a fair showing in favor of trying to stand near the head of one's class.

—One naturally opens the February *Lippincott's* at the first of Mr. Edward King's papers entitled "With the Russians in Bulgaria," and perhaps one turns back to it after all the rest of the number has been read or skimmed through. Mr. Bacon's concluding paper on Sicily will certainly repay perusal, but what, just now, is the picturesqueness of Syracuse to that of Tirnova, which Mr. King pronounces "positively the most picturesque town that I have ever seen"? It is not merely that Mr. King is a graphic writer, or that the interest of his story grows out of the common hardships of newspaper correspondents during the present campaign, but that we feel that an American spectator of the Russo-Turkish conflict is, or ought to be, of all others the freest from prejudice and bias. What Mr. King, therefore, has to say about the Russian commanders and their troops, and about the Bulgarians, carries with his own countrymen at least a degree of weight which no foreign reporter, even though a better observer or an abler writer or of wider experience in the field, could command. He tells us now of the incidents of the march from Simnitza to Tirnova: of the Cossacks, "our chief delight," whose melodious choruses by night and day neither dust nor fatigue could choke, who were brutal only when druuk, and who would "sit for hours idly singing or basking in the sunshine, and evidently anxious for no narcotic," in marked contrast with the inveterate smoking of the Prussian or French foot-soldier; of the "democratic freedom from affectation and perfect amiability" of the Russian officers, and their "almost excessive frankness, even in dealing with their own faults"; of the much more intimate relation between officers and men than in German or other (non-American) armies; of the Grand Duke Nicholas, equally unaffected, superintending his own dinner of liver and bacon; of General Skobeleff, the father, slaughtering and dressing a sheep with his own hands; of General Radetzky, "a tranquil, easy-going commander of the old school," in appearance "more like a good bourgeois shopkeeper than like a general"; of General Dragmiroff, "a handsome gentleman of elegant deportment," every inch a soldier; finally, of the Bulgarians, who win the writer's favor in proportion as he gets away from the Danube and approaches the Balkans—there showing all the vices engendered by a crushing despotism, here ashamed to admit that they had ever been slaves.

—Among the signs of the distress under which most newspapers have been laboring for more than a year past is the revival of "special inducements" to subscribe, and of extraordinary bargains in chromos, dictionaries, and cyclopædias. This is not confined to the religious press, but has been resorted to even by the daily newspapers, and has given occasion to some malicious pleasantry on the part of more fortunate journals. The *Christian Advocate*, of this city, however, the foremost Methodist organ in the country, has, in its efforts to keep up its circulation, reached a depth of abjectness which not even the bathos of its appeal can make a seemly topic for jesting. It devotes two and a half columns of the editorial page in its last issue to "a parting word" "To that Non-renewing Subscriber," and after telling him that "We have a sort of invested right in you: you have been in our prayers every day since we met," and that he will lose the difference between the subscription-price and the far greater cost of as much reading-matter in book form, and inviting him to look on a fancy picture of the family that takes the *Christian Advocate* compared with an equally fancy picture of the family that does not, it proceeds to address him a series of arguments that end by taunting him with the smallness of the sum for which he takes the risk of perdition here and hereafter. This is the style of them:

"Your mother read the *Christian Advocate* before you were born, and read it many a day as she rocked and hummed you to sleep. She has gone late home to heaven. This year's *Advocate* may guide your feet safely to that same heaven. Brother, can you afford to hush these memories and quench this light for $2 70?"

That for impudence, and the following for puerility:

"If you allow your *Christian Advocate* to be stopped, and all others should follow your example, of course you would *utterly stop* the publication of religious papers and literature, and abandon the field for the arch enemy. Brother, can you afford to strike civil society such a fatal blow for $2 70?"

And this for a genuine Papal indulgence:

"One little boy walks to school once a week, and saves his car-fare that his mother may have the *Christian Advocate*. God is certain to honor that lad in time, and almost certain to glorify him in eternity."

And this the reader may characterize for himself:

"P. S. Tell your pastor to send on your name immediately, or, if he is not accessible, address Nelson & Phillips, 805 Broadway, and may the blessing of God abide upon you!"

We would call the attention of the New York *Observer* (Religious Department) to this performance. It has lately been exercised about the secular press meddling with spiritual affairs; can it honestly say that if the *Advocate's* mode of meddling with secular affairs should be generally adopted, it would not be a public duty to "*utterly stop* the publication of religious papers"?

—The late Samuel Bowles, editor of the Springfield (Mass.) *Republican*, whose death occurred on Wednesday week, achieved a distinction as honorable as it was great and, on many accounts, surprising. In a word, his merit may be said to have lain in the fact that he elevated a small country newspaper to the front rank of metropolitan journalism. He began, however, by giving it a marked superiority over the Boston press, and a predominant influence in that section of Massachusetts to which he was a hundred miles nearer than Boston was. Later on he took advantage of being a hundred miles nearer New York also, both in securing the news of the day and in catching the editorial opinion for which provincial newspapers are accustomed to wait before committing themselves on public questions. Under his efficient direction the *Republican* became the most comprehensive newspaper—we believe it is no exaggeration to say, in the country. Its space forbade its competing with larger papers in fulness of details, but its system of condensing and digesting the news enabled it to cover all the important topics. Mr. Bowles, however, did not depend alone for his information on what the

mails brought him or his correspondents could ascertain: he journeyed often and far to the centres of news and politics, and through social intercourse obtained the private views of the leaders of thought and party, more especially, of course, in the Republican ranks. It must be called a defect in him that as a newsmonger he was apt to violate the confidence of those who forgot how entirely he was a journalist. "It was his favorite theory," says a critic who knew him intimately, "that the editor and the man, if they did not have separate identities, had different and distinct duties and privileges, and that an editor ought to do things for which as a man and a gentleman he was not responsible." This was illustrated in other ways than the one just mentioned. When we examine Mr. Bowles's rank as an editor on the higher scale of a thinker, we believe his chief title to remembrance was his independence not of thought but of utterance. He was not afraid to speak his mind; and his mind, however little original, was his own. In other words, he was unprovincial; and on this account as much as on any other he failed in his solitary attempt to conduct a daily newspaper in Boston. He was not only out of place in a small and homogeneous city, where the pressure of public opinion is too direct and strong for the journalist to withstand it, but his independent speech had the air of boastful superiority. He was free from party dictation long before he broke with the Republicans to support Mr. Greeley, and we cannot doubt that his example did much to bring about that emancipation of his brother editors which is one of the most cheering signs of the political progress of the past decade. People will naturally ask, as in the case of the *Times*, the *Herald*, and the *Tribune*, after the death of their founders, whether the *Republican* can maintain its eminence now that its informing spirit has left it. To our minds the problem is not the simple one of replacing Mr. Bowles's qualities. The highly perfect organization which he created will probably continue to run with efficiency and smoothness, in charge of those who have been trained in it; it is no secret that his principal assistants have had a better education than Mr. Bowles, taught mostly in the printing-office, ever had; doubtless, too, men of sounder judgment and less caprice—perhaps, in the largest sense, of more principle—than he, can be found to succeed him. What will be wanting? At first (it may not be so always) the guaranty which the public has in the known character and standing of the editor-proprietor. We are full believers in the value of anonymous journalism, and the point we insist upon is not a contradiction of it. We admit that the three New York papers alluded to have been improved since the death of their founders; but this has come about through the elimination of personalities, not by the removal of a responsible head whose name stood at the top of the editorial page, and to whom the public looked for good faith and consistency in the conduct of the paper, or at least for a clew to its course, as they have looked in vain since.

—The play of "Adrienne Lecouvreur" has not, we believe, been put on the boards in New York for a long time; and its resurrection for the purpose of enabling the Polish actress Modjeska (or, to give her her full title, the Countess Bozenta Modjeska) to appear in the principal part, may be called one of the dramatic events of the winter. We confess that we did not observe how the "emotional play" brought out at the Fifth Avenue Theatre differed from Scribe's drama, though it is called an "adaptation." Certainly the leading features of the original were preserved. The range of emotions depicted in it is very great; in fact, it would be hard to conceive a play better adapted to bring out the strong points of a great actress in a pleasing way. There is the opening love-affair with the unknown soldier; there is the jealousy to which his supposed interest in another gives rise; there is the well-founded hatred of a scheming rival; there is the confiding loyalty to her lover which leads her to save her rival from ignominious exposure; there is the whole range of feelings which arises from the discovery that the stranger who has made love to her is no other than the greatest soldier of his age, and a "claimant" to a throne; there is the black despair and wretchedness which arises from a conviction of his faithlessness; and, finally, there is the supreme moment when his unchanged fidelity is made clear, and she dies in his arms. Beneath all the tragic events of the drama there is a very pure, simple character which they bring out in strong relief, but never alter, and which triumphs in its own martyrdom. The acting of the Countess Modjeska is very good and interesting. She is certainly not a Rachel, but she is a good actress; she has a thorough conception of her part, a considerable *vis tragica*, and a pleasing manner. Although she is essentially feminine, it is curious to notice that she is equally strong in those denunciatory parts of her dialogue which are almost masculine, and in the softer passages in which an almost infantine playfulness is required, as, for instance, in her balcony scene from "Romeo and Juliet," in which her *Juliet* was a real child just becoming a woman, and not, as we have so frequently seen her, a middle-aged matron. Her delivery and enunciation are wonderfully good considering that she plays in a foreign language; much better, for instance, than Fechter, who has been deservedly commended for the success of his struggle with the difficulties of English—though, of course, the pronunciation of a foreign woman, and especially a pretty foreign woman, never offends the ear as does that of a man. There is something in the gentle efforts of the weaker sex to subdue the rugged ferocity of English pronunciation that appeals to our more generous emotions, and elicits a sympathy which it is difficult to see any reason for in the case of a man, who, one cannot forget, has no excuse for doing anything unless he can do it better than, or at least as well as, somebody else.

—The play was well put on the stage at the Fifth Avenue, but there is something clearly hopeless in the attempt to get any New York stock company to take the parts of ladies and gentlemen in a French comedy of intrigue such as Scribe's. The characters—the duped husband; the wicked but refined and well-bred wife; the gay Lothario, the admiration of the women and the envy of the men; the devoted, assiduous, and immoral *abbé*—are all types that are foreign to modern American experience, and the lack of experience nothing can supply but such a liberal education as actors and actresses with us do not get. The material for such acting undoubtedly exists with us, as in other countries, though we should never expect foreign comic types and particularly types of a past age to be much more than imitations. But with us they are not even this. The actors at the Fifth Avenue do not understand the elements of French pronunciation, and we have no hesitation in saying that, taken altogether, Modjeska's whole English part had fewer glaring faults than the rest of the company managed to crowd into the dozen French words they had to say. It is really unpardonable that actors on any civilized stage should be permitted to pronounce *Adrienne* as if it rhymed with Mary Anne, or Lecouvreur, *La-cover-aire*. In fact, the "speculator" at the door, of whom we bought our ticket, and who informed us that the play going on inside was "Addereeny," seemed only a shade less educated than several of the leading *dramatis personæ*. And yet the company is a very good one, too, as companies go; Mr. Le Moyne, for instance, is inimitable in farce-acting, and performs his part very creditably in English comedies; why he should be cast for the *Prince de Bouillon*, it is difficult to conceive.

—A very remarkable anticipation by Leibnitz is brought to light by Professor Bowen in his 'Modern Philosophy' (recently published by Scribner, Armstrong & Co., and reviewed in these columns). In tracing the consequences of the "Law of Continuity," Leibnitz, as quoted by Professor Bowen, remarks that "not only I should not be astonished to learn of the discovery of animated beings which, in many of their properties—for example, those of nutrition and propagation—might pass for vegetables just as well as for animals, but I am even convinced that there must be such, and that natural history will, at some future day, point them out to us." "A bolder prophecy," adds Professor Bowen, "or one more exactly verified, after the lapse of more than a century, it would be difficult to find in all the annals of science."

—The derangement of industrial and social relations in South Carolina caused by secession and emancipation was considerably mitigated by the development of the great phosphate interest; and now, as if to mark the return to a healthier political condition, the planting and manufacture of jute begin to assume importance. It has been found that the home of the Sea-Island cotton is also fitted for the profitable culture of jute, and the Charleston Bagging Manufacturing Company has begun to open subscriptions with a view to starting a mill that will employ sixty hands, of whom only eight will be men. The experiments made with the plant in the neighboring States of Georgia and Florida, as well as in Louisiana and Texas, all point to the ultimate success of this new industry, already more extended than those who have given no attention to the subject might suppose. The report of the Commissioner of Agriculture for 1876 contains an elaborate paper on jute, by Prof. S. Waterhouse, of Washington (St. Louis) University, who has studied its cultivation in India; and as the earliest plantings in the United States take place in April, there is time for all who wish to inform themselves to do so. Some of the stalks grown in the States named reached the height of fifteen feet; the yield was in several cases at the rate of 3,500 pounds to the acre; and the fibre in some instances was judged superior to the Indian. The seed, too, has been improved, and is one-sixth heavier than

that of India. Many branches of manufacture which now use jute either sparingly or not at all would be stimulated to use it freely, not only for bagging and baling, but for paper and all sorts of textile fabrics from carpets down, as the example of Dundee has so well taught us. A product which has become the fourth staple in the exports of India, yielding precedence only to cotton, opium, and rice, may easily take a commensurate rank with us. We appear to have in abundance the hot and moist climate and good soil which it affects, and we certainly have the ingenuity to compete by machinery with the crude and cheap labor of India or the skilled labor of Scotland. We wish success to the Charleston enterprise.

RUMFORD.*

NO more worthy tribute can be paid to an intellectually great man, and no more appropriate memorial of his life can be preserved, than a complete and elegant edition of his works. Such a recognition the French Government bestowed both on La Place and on Lavoisier, and in publishing the five large octavo volumes before us the American Academy of Arts and Sciences were actuated by a similar motive towards Benjamin Thompson, Count of Rumford, one of the greatest of the scientific contemporaries of those eminent French philosophers. They felt, moreover, that they had a duty to discharge in this respect as almoners of a considerable fund which they owed to Count Rumford's bounty and love for physical science. Memorial volumes like these preserve more effectively than any other monument could the record of devoted labor and noble achievement, but their great value lies in the circumstance that they add finish to the completed work of a great man's life, and exhibit both its unity and its relations to the intellectual progress of the age; for the work of no great thinker can be duly appreciated until it is seen in the perspective which time alone gives. This was peculiarly true of the chief contribution which Count Rumford made to the knowledge of the world. We now know not only that his experiments were the first of that memorable series of investigations which have resulted in the modern mechanical theory of heat, but also that he distinctly stated this theory and proved that it was legitimate. In his memorable paper entitled "An Enquiry concerning the Source of the Heat which is Excited by Friction," read before the Royal Society of London, January 25, 1798, and printed at the close of vol. i. of the Academy's edition of Rumford's works, after a perspicuous description of his crucial experiments in connection with the boring of cannon, he adds these pregnant sentences:

"And in reasoning on this subject we must not forget to consider that most remarkable circumstance, that the source of the heat generated by friction in these experiments appeared evidently to be inexhaustible.

"It is hardly necessary to add that anything which any *insulated* body, or system of bodies, can continue to furnish *without limitation*, cannot possibly be *a material substance*, and it appears to me to be extremely difficult, if not quite impossible, to form any distinct idea of anything capable of being excited and communicated in the manner the heat was excited and communicated in these experiments, except it be MOTION."

In a subsequent paper, entitled "An Enquiry concerning the Nature of Heat and the Mode of its Communication," read before the Royal Society February 2, 1804, and printed at the beginning of vol. ii. of the Academy's edition of 'Rumford's Works,' this theory is still further developed, and on pages 104 and 105 of this volume the reader will find almost as clear an exposition, and as brilliant an illustration, of the nature of that molecular motion which, as we now believe, constitutes heat, as that which a few years since so delighted the public in Professor Tyndall's admirable lectures on "Heat as a Mode of Motion." But although the theory was not only clearly stated and brilliantly illustrated by Count Rumford, but also substantiated by numerous careful and conclusive experiments, yet the importance of the facts thus elicited was not appreciated by Count Rumford's contemporaries; and his theory remained unfruitful for half a century, and did not meet with popular recognition, or even receive much scientific support, until the publication of Professor Tyndall's book above referred to. It is true that as a "mere speculation the hypothesis, that heat is a mode of motion," was, as Rumford himself says, "of ancient date" (loc. cit. ii. 105); but no one who carefully reads the papers on heat in these volumes can question that it was the experiments of Count Rumford which first elevated this before barren speculation to the position of a well-grounded and, therefore, fruitful scientific theory.

Although the mechanical theory of heat is undoubtedly Count Rumford's greatest contribution to physical science, yet it is only one of a long series of discoveries and observations in optics as well as thermotics, many of which alone might have made the reputation of a modern scientific investigator. With our recent methods and appliances we have, of course, been able very greatly to extend his observations, and obtain far more precise experimental data; but these later investigations have only served to confirm the general accuracy of Count Rumford's work, while they have made evident the sagacity of his theoretical conclusions. Most, however, of Rumford's important results have been so long a part of the popular knowledge, and pass so current in the elementary text-books, that the original benefactor has been forgotten, and it is probable that but few of the present generation of physicists, whose attention has not been directly called to the subject, appreciate how much their science owes to the investigations of this remarkable man. If these volumes of the American Academy serve to render more conspicuous the broad foundations which he laid, the chief purpose of their publication will have been fully served.

But Count Rumford was more than a man of science. He was a great philanthropist, but a philanthropist whose zeal was tempered with the wisest discretion. His management of the poor in Munich during his first residence there between 1784 and 1795, when he nearly freed the city from the extreme pauperism with which it had been previously cursed, is certainly one of the most successful philanthropic efforts that the world has known. His interest in the poor led him to investigate with his usual ingenuity questions bearing on the economy of fuel, food, and clothing, and to bestow a wealth of invention on "Fire-places and Kitchen Utensils," which at the present time seems scarcely worthy of his genius. A considerable portion of his published works relate to these subjects, and the modern scientific reader will sometimes smile at the minute details with which he describes his grates, boilers, stewpans, and roasters, or at his recipes for making soups, puddings, and coffee. But all this becomes dignified by his philanthropic motive, and will appear to have been necessary to the accomplishment of his beneficent purposes, when we consider how much ignorance he had to instruct and how much routine to oppose. Moreover, throughout all this portion of his writings there glows a human sympathy which honors Rumford as a man more than the greatest of his scientific achievements. In the Academy's edition of Rumford's works, the philanthropic essays—many of which were obviously designed to serve a temporary purpose of instruction and conviction—stand side by side with the records of absolute additions to the knowledge of the world, and some persons may think that it would have been more conducive to Count Rumford's scientific reputation had the Academy limited their publication to papers of the last class. But such a publication would not have been a truthful memorial of the great man whom the Academy aimed to honor, and we believe that they adopted the only proper course in making their edition of his works *complete*. The Rumford Committee of the Academy, with whom the first suggestion of the publication originated, and who were entrusted with the undertaking, spared no pains to make the edition complete in every detail, hoping that it would be accepted by scholars as a worthy memorial of the great services which Count Rumford rendered to mankind in philanthropy as well as in science.

The incidents of Count Rumford's life, from its early beginnings, when, at the age of thirteen, he was apprenticed as Benjamin Thompson in a retail "variety store" at Salem, through its culmination, when, as a count of the Holy Roman Empire, he was at the head of the electoral army of Bavaria, and until its melancholy end at Paris, are so varied, so wonderful, and so wholly different from the usual tenor of the life of a man of science, that, as graphically presented by the Rev. Geo. E. Ellis, they have all the interest of a romance. Dr. Ellis does not attempt, however, to give the full details of the count's scientific labors, nor does he discuss their bearing on the contemporary and subsequent history of physical science. This was indeed not his object, nor could it have been the distinct object of the Academy in selecting a distinguished literary man rather than a scientific scholar to prepare the biography. The great local interest in Count Rumford's public career, and the desire to show its connection with his early New England home, were undoubtedly the motives which led Dr. Ellis to prepare and the Academy to publish this highly interesting account of Count Rumford's political, social, and family life. From what has been said it is quite evident, however, that this plan of a biography could not be wholly in harmony with the first design of the

* 'The Complete Works of Count Rumford.' Published by the American Academy of Arts and Sciences in four vols. 8vo. Boston: Estes & Lauriat.
'Memoir of Sir Benjamin Thompson, Count Rumford By George E. Ellis.' Boston: Estes & Lauriat.

Rumford Committee, and we should greatly regret if Dr. Ellis's book, excellent as it is within its sphere, should prevent the Rumford Committee from carrying out their original purpose of preparing a full history of Rumford's scientific investigations. Since the publication of the Academy's edition of Rumford's works the deficiency we have noticed has been in part supplied by the valuable and learned pamphlet of Dr. Gerhard Berthold, entitled, "Rumford und die mechanische Wärmetheorie." But Dr. Berthold's monograph is not accessible to many American or English readers. Moreover it has a partial object, leaving much to be done, and we cannot consider the Academy's work completed, nor its purpose adequately fulfilled, until the contemplated memoir of Rumford's purely scientific career has been added to these elegant volumes.

M. DOUDAN'S NEW VOLUMES.*

THE second instalment of M. Doudan's letters proves as substantial as the first. M. Doudan was a copious as well as excellent letter-writer, and the success of the enterprise undertaken by M. d'Haussonville has been such as to make his correspondents yield up the remainder of their treasures. The letters here offered us do not belong to a new period of the author's life: they coincide in date with those already published (the first are of the year 1832); they are the result, in part, it may be supposed, of a second sifting, a second picking over of the basket, as we may say, and in part of the accession of fresh material. The first volumes contained perhaps the best things; but the difference is not very great, and people who, like ourselves, took a fancy to M. Doudan, will find these very well worth reading. The effect of them is not to present us with a new or in any degree modified portrait of the author, but to pass the pencil over the old outline and make it a trifle more definite. Here, as in the former publication, his delicacy, discrimination, discretion are the striking and charming features. A quiet scholar who was at the same time in a very sufficient degree a man of the world, and whose life was passed in the best society, who preferred observation to action, and with whom observation always implied conversation—conversation of the most expansive and reciprocal kind—such is the figure that detaches itself from these pages. His letters are simply his conversation, pen in hand, and they have all the alertness and lightness of his talk, as we may be sure that his talk had much of the neatness and natural smoothness of his letters. These, we must add, are not only the portrait of a single mind; they are also, in a sense, the portrait of a society. In this respect the picture, just as it stands, is certainly a very pleasing one. We may say that it is not complete, but what there is of it is extremely flattering. It represents a group of people whose life appears to be primarily the liberal play of their intelligence or their curiosity and interest in regard to all the events and productions of their time and of other times, and their desire to arrive at just and comprehensive opinions about them. These people, it will be remembered, were, more immediately, the family of the Duc de Broglie, the father of the recent highly conservative adviser of the President of the French Republic. The present Duc de Broglie was an intimate friend of M. Doudan, though it is to be observed that very few of the letters in the volumes before us are addressed to him; M. Doudan had been, in a measure, his preceptor, his guide, and philosopher.

It is impossible for the reader of these pages not to reflect that the blindly repressive policy which lately characterized the Ministry of which the Duc de Broglie was the most eminent member is not a very satisfactory offshoot of the teachings of M. Doudan. People who think M. Doudan has been somewhat overrated—and there are of course such people—have only to point to the exploits of his "favorite pupil." We ourselves, however, should not accept this as a refutation of our claims; for we should hesitate to assert that, if he had lived to the present hour, M. Doudan would not have sided with the policy of the recent Government. We are, on the contrary, very glad to mark in this manner our sense of his limitations. He was an intense conservative; the reader feels that on every page. Temperance and moderation were indeed his divinities, and he would certainly not have found them in the camp of MM. Fourtou and De Broglie. But it is plain that, as time went on, he became more and more an alarmist; he had a certain fund of liberalism, but he had emptied the cup. One of the few places in these letters in which he speaks with anger and acrimony is that in which he resents the right of the English newspapers to suggest that the justice of the Versailles Government towards the persons accused of complicity with the Commune be tempered with mercy. (It is very true that in another place he expressly advocates moderation.) His intelligence, his taste and wisdom, his lightness and alertness of imagination, are all most beautiful; but we confess that with much that is constantly first-rate, and worthy of all admiration, in his judgments and perceptions, he is always liable to give us a glimpse of the chain—a golden chain, if you will—that binds him to the old classical, conventional, and partial standpoint. He remains, in politics and morals as well as in literature, the man who can see no merit whatever in the poetry of Victor Hugo, but who is charmed with the lucubrations (he always kept an eye on the new English books) of the 'Country Parson.'

But we feel like apologizing for dealing with M. Doudan otherwise than by simply quoting him. His letters are a running commentary upon all the important things that happen around him—of the small things he speaks little—and we have only to choose the subject that we may desire his opinion of. What he says is always suggestive, especially because he has found the point he starts from itself suggestive. He always enlarges the topic, always passes toward some general reflection, some higher point of view. We only regret our want of space. M. Doudan's great passion—his only passion—was for literature; he was a *reader*, to his finger-tips. Perhaps the best things he says are the things suggested by books, which are his usual topic. "There are people who in their whole life," he says, "have never read four pages in a year, and who tell you with assurance that reviews are a very superficial sort of reading." M. Doudan read a great many reviews, as well as other things, and he was not superficial. Apropos of Mrs. Gaskell's novel of 'Cranford' (he was very fond of English novels) he launches into a dissertation upon the drawbacks of the theological habit of mind—upon its making us lose sight of the *vrai fond* of human nature. His remarks are excellent, but he ends with apologizing for them, and wonders what they have to do with 'Cranford.' But "j'ai la fureur," he says, "des idées générales." He says elsewhere that he had known an English military surgeon who had been surgeon of the Duke of Wellington, and who had carried about with him in all his campaigns a library of two hundred volumes. "There is a man by whom one would like to be looked after in an illness, and by whom one would gladly have a leg amputated." Some of his best literary judgments are in the later letters. "As for M. Victor Cousin, they say that in all this he admires the genius of our Emperor. . . . He bows down before the greatest politician of our time; so he expressed himself the other day. . . . At the end of his life his mind will be very weary of all these gambols through the finite and the infinite. Socrates will have something to say to him in the other world upon the duties of the profession of a philosopher." Here is something very good apropos of Madame Sand:

"Her misfortune at present is to pursue ideas. This rage for having ideas has been the ruin of many writers who had talent and a happy imagination. She deforms her people in order to squeeze them into the lines of her systems. There would not be so many living beings in Shakspere if he had done this way. Nature, having larger views than the mind of man, makes people who are not simply a republican, a royalist, an officer, and a priest. Man has, in all senses, a something superfluous which corresponds probably to plans wider than our conceptions. It is for that reason, indeed, that people who have too much the stamp of their profession seem rather like fools."

In the former volumes there were two or three allusions to M. Renan of a rather irreverent sort, and here the tone of reference to the author of the 'Life of Jesus' is always ironical. "I have never seen in a theologian so great an acquaintance with the Oriental flora. He is a very much better landscapist than St. Augustine and Bossuet. He sows geraniums, anemones, and buttercups to reap incredulity." There is an excellent and very appreciative judgment upon Sainte-Beuve, which is too long to quote, in which M. Doudan speaks of his combining "the industry of a Benedictine with the penetrating imagination of a nervous woman." Here are two lines which are a very good example of the quiet penetration of the author's literary instinct. The allusion is again to Madame Sand: "Read the 'Comtesse de Rudolstadt,' in order to see how it does not resemble Bohemia. But, to say so in passing, I hold that if, in portrayal, exactness is a great virtue, we must yet not be too severe upon writers whose reveries produce fine pictures of distant countries of which they only know the general features." This remark, which is deeper than it appears, would seem to have come from a man who had himself tried imaginative writing. But M. Doudan had a great deal of imagination. Here, too, is a declaration which comes apparently from a man who has the "inside view": "I believe that the men who write are the men who profit by odd moments. One has never one's time before one as a housewife has a long piece of

* 'Mélanges et Lettres de X. Doudan. Avec une Introduction par M. le Comte d'Haussonville, etc.' Tomes iii. and iv. Paris: Calmann Lévy; New York: F. W. Christern. 1877.

cloth. Life only gives us little squares of stuff; but of these little squares industrious people make great counterpanes which hold very well together."

There is almost always with M. Doudan a strain of melancholy and latent depression, and in the later letters this is especially noticeable. He is at times irritable and invidious; he takes a dark view of the future of France. It must be remembered that he was always an invalid, a valetudinarian. "If you believe I have no more fears," he writes in 1843, "you are in a very great error. I should like very much to see those people who tell me in a great, strong voice that I am perfectly well—I should like to see them obliged to handle this little network of spider-webs that is my own person." Like M. de Broglie to-day, M. Doudan was (already in 1850) haunted by the prospective "demagogy:" "Since it has been discovered that Trouville is a solitary place, the whole nation has thrown itself upon this unhappy spot. Excursion trains vomit forth the scum of the capital and its suburbs. . . . They represent pretty well what France will be when the demagogic level shall have radically flattened it down." We are sorry to say that, in 1866, M. Doudan sympathized so far with what he himself admits to be the national "Chauvinism" as to think that the French were very great fools for allowing Germany to resolve herself into a nation. He was not for war, he says, at that moment, but for war eventually, as an anticipatory and preventive measure. M. Doudan, dying in 1872, lived through the siege of Paris and the Commune, and the letters of this period are of course full of sadness. He had always, apparently, had a friendly and familiar feeling toward England; he was versed in English literature. (His great sympathy, it must be said, however, was for Italy; his pages are full of charming passages about Italy.) But at the last he rarely alludes to England without bitterness. We have mentioned his indignation at the plea for moderation after the suppression of the Commune, dictated by her "pedantry of apparent liberalism." "What life are you leading in London?" he asks of a friend. "Do you go much into the *beau monde*? A poor Frenchman must have a first moment of embarrassment when he goes into a drawing-room full of people to whom no such things as these have happened since the invasion of the Danes. And even then!"

The last of these volumes terminates with the promised essay on the 'Revolutions of Taste,' the little dissertation which was circulated among M. Doudan's friends, but which he never consented to publish. It will, perhaps, now be found a little disappointing. It contains much ingenuity and many happy judgments; but in form, at least, it illustrates rather the rigid and conventional side of the author's own taste, and in felicity of expression it is very inferior to the letters.

RECENT NOVELS.*

IT would be hard to find a writer who covers more paper than Mrs. Oliphant does. We have now before us two novels of hers which have appeared within a few weeks of one another, and there is yet a third, 'Young Musgrave,' which is completed in *Macmillan's Magazine* and will very soon be published. Meanwhile she is busy with other literary work, editing the series of 'Foreign Classics for English Readers,' and preparing two of the volumes herself. Her stories bear here and there marks of haste in the occasional repetition of a sentence that has already done duty a few chapters back, but, in general, one sees only the ease which comes from the long practice of authorship. There is a family likeness between all her novels, but it is of the most agreeable sort; such are the constant kindliness, humor, and sympathetic observation with which they are all written. Then, too, there is a gentle, unobtrusive poetical vein, not merely that which is revealed by her charming drawing of young girls, for instance, but one that is more charily displayed in the romantic scenes and in little incidental touches which those who read her stories cannot fail to recall.

The first of the two novels just mentioned, in the order of publication, is 'Mrs. Arthur,' which tells of a young Englishman of good family, the only son of a baronet, who falls in love with the handsome, but vulgar and ignorant, daughter of a tax-collector in one of the suburbs of London. His family oppose the match as best they can; his most intimate friend remonstrates with him with the usual success, and the bad-tempered Nancy very soon attains the position she had so longed for. The husband, Arthur Curtis, finds the awakening from his dreams anything but pleasant. His wife shocks him by her taste in dress; he takes her to Paris, but the pictures, the theatres have no charm for her, and she sighs for her congenial home. They return to England and hire a villa near the paternal tax-collector, and lead an utterly miserable life together, until, in an access of unusually violent rage, she runs away from her husband and returns to her family. Arthur leaves the country to take a diplomatic position at Vienna, but in time Nancy sees her follies and devotes her energies to self-improvement. Gradually, by some unexplained process, she becomes like other people; she manages to charm Arthur's father and mother before they know who she is, and the book finally ends well. Nothing could be better than the description of the poor young fellow's infatuation and his impatience of opposition. But nothing could be saintlier than his behavior after his marriage, when his wife gave frequent exhibition of her ungovernable temper. Mrs. Oliphant draws the unhappiness of the poor hero with a clever pen, and too much cannot be said in praise of her description of Nancy's family. Alongside of the main love-story runs an account of the love the remonstrating friend bears for Arthur's sister, which is a very different piece of business from the romance of Arthur's life. It is in just such subjects of social complications in English life that Mrs. Oliphant is at her best. The mantle that Miss Austen first wore and Mrs. Gaskell inherited now covers her shoulders; but it is made over anew to suit the present fashion, and it is a most useful as well as becoming garment.

'Carità' is another excellent story, so simple and in good measure uneventful that the plot of it hardly needs to be mentioned. To be sure, at the beginning of the book there is brought in a woman who, to avoid the slow torture of inevitably painful death, takes poison—an episode which stands in the slightest relation to the rest of the story, and is needlessly painful at the best. But apart from this everything moves as smoothly as only Mrs. Oliphant's skill can direct the course of novels. The episode of the young girl who is impatient with the sordidness of her home and goes to the house of the sisterhood to teach, is very well narrated, though, to be sure, with plenty of satire that must seem frivolous to those who belong to the highest section of the High Church of England.

It is a violent change from Mrs. Oliphant's refinement and delicacy to the cheap wit and coarse vulgarity of one of the last of those productions which aim at ridiculing the different members of the family. 'My Mother-in-Law' is, on the whole, the poorest of the lot. The only amusing thing about it is the fact that it has had a large sale, for which it must be indebted solely to the title. Even 'That Husband of Mine' shines like a classic in comparison with this dull description of the conflict between the somewhat unpleasant mother-in-law and the ill-bred young man who was the object of her special dislike. The emptiness of the book is its most prominent trait, and its success is a melancholy commentary on the public taste.

'The New Schoolma'am' may be called less poor; indeed, there is some real humor in it. It is the slightest of sketches, describing the adventures of a rich young girl who becomes tired of fashionable life in the city and takes the place of schoolmistress in a village among the mountains. She meets the gifted and penniless artist and they marry. The author's little hits at the country people and at the city people who spend the summer in the country are amusing.

Mrs. Annie Edwards's 'A Blue Stocking' will not add much to her fame. The scene is laid in the Island of Jersey, and there are pretty descriptions of the place, but the people who do and act and suffer in these pages have little life in comparison with the characters who figure in some of her best-known novels. The tale, too, is so short that it seems as if pressed into service from a magazine. The Blue Stocking who is described is an over-educated girl who had engaged herself, some years before the opening of the story, to a man who falls in love with one of Mrs. Edwards's fascinating heroines. The Blue Stocking, also, has a weakness for a cousin of hers, so that, after a few pages of double-barrelled love-making, affairs right themselves, and the story ends.

'Phyllis' bears more resemblance to the conventional novel, and especially to that form of it with which Miss Rhoda Broughton has enlivened the world. The heroine gives us her autobiography, and certainly the whole account of her rowdyish girlhood is amusing enough. There is a similar hoydenish good-nature in Phyllis's account of her married life (she marries a rich neighbor, who was supposed to have been trying to win the older sister), but while the husband is a capital fellow, Phyllis

'Phyllis: A Novel. By the Duchess.' Philadelphia: J. B. Lippincott & Co. 1877.

herself leads him a hard life. There is a tolerably disagreeable account of the sayings and doings of a rather fast set of people, and an attempt, which falls through, to give an account of a desperate flirtation. A melodramatic first wife is introduced, who puts a stop to a good deal of foolishness, and finally, by her timely death, gives the husband and wife an opportunity to meet once more, much improved by their enforced separation.

Readers of 'Mr. Smith,' which appeared a few years ago, will have their pleasant impression of its author only strengthened by another novel, 'Pauline,' from the same pen. With the exception of the heroine, who is so charming that the reader feels sure she is predestined to misery, the characters are, to speak plainly, commonplace, but not so the mode in which they are delineated. The construction of the story, again, is not remarkable. The incidents do not move out of the familiar track. The mysterious young man helps the charming heroine, who has lost her way; a fortune is also lost, and the heroine has to live with her relations; but although such things have been heard of before, it is not often that the reader comes across such intelligent satire of vulgar people, and such sympathetic drawing of a fine character, as can be found in this book.

Another good novel is Madame Linda Villari's 'In Change Unchanged.' It certainly lacks the touch of superiority that distinguishes 'Pauline,' yet it shows considerable knowledge of the world, and plenty of clear-sighted study of human beings as they appear in their social relations. The scene of the story is laid in England, India, Italy, and Tyrol, while Italy, and especially Florence, supply the greatest amount of local color. That the art of it rises anywhere much above the careful rendering of local color can hardly be affirmed. The love-stories, it is true, have a certain newness, yet their beginning and end can be sniffed afar off by even an unpractised reader; the characters bear a close resemblance to the stock company of the modern novel; and the Florentine painter, Porta, is as artificial a creature as one of his own dummies. While the men are all rather poor, the women bear testimony to the author's cleverness, especially Mrs. Trevelyan, who is the evil spirit of the plot.

No one can deny that Mrs. Burnett's 'Surly Tim, and Other Stories' is impressive and calculated to move even the most indifferent reader's feelings, although one may not approve all the means by which the author's success has been accomplished. The stories are eight in number, and we are racked by the account of no less than six deaths and one attempted suicide; and it may perhaps be said that if this cold enumeration seems to ignore the excellent skill of the writer, it is yet justified by the conventionality of some of the touching incidents. The author has aimed at being pathetic, and she has almost invariably hit the bull's-eye. Gradually the reader acquires a ghoul-like instinct that makes him expectant of tragedy, so that by the time he comes to the last story he is sure that "Seth" is more than usually mortal, and might possibly escape being killed in the mine, but only to die of some painful disease upon the surface of the earth. This effect, however, is cumulative in the collection, and could not have been so marked when the tales first appeared in a magazine, sandwiched between directions about house-furnishing and poems on Spring, and they should be judged separately, so far as possible, although thus put together they throw more light, even if it be lurid, upon Mrs. Burnett's method of writing. Taking 'Surly Tim' apart from the other stories, the invention is of a very moderate kind, and the end of the hero, whose apparent surliness was in reality justifiable grief, is almost the usual anti-climax of the touching sketch. The pathos would have been simpler and truer if the poor man had been left to die in peace; but no, another turn is given to the thumb-screws, and we hear him whisper: "Th' eend! ay, this is th' eend, dear lass, an' the path's aw shinin' or summat and— Why, lass, I can see thee plain, an' th' little chap too!" There are other sketches in this little volume that show Dickens's influence.

This volume, by the way, Mrs. Burnett tells us in the preface, is the only one of the many published since the success of 'That Lass o' Lowrie's' that appears with her approval. One of them, however, 'Dolly,' will not injure her reputation, if the reader will only remember that the author had no opportunity to make the few excisions that good taste would require, and that hence there are more allusions to "Vagabondia" than are commendable. The story is not exceptionally good, but it has what Doudan calls "the lowest of literary pleasures, interest," and this to a very considerable degree. The heroine is an attractive young girl who is a capital combination of coquetry and kindness; the troubles which beset her and her brothers and sisters are calculated to wring the heart, not excessively, but in discreet moderation, while a good ending closes the book. It is easy to see that, apart from her regret at the few superfluous passages mentioned above, the author may feel as if this story were more trivial work than the discussion of a "problem" like 'That Lass o' Lowrie's.' But many readers will feel that the greater naturalness of 'Dolly' fairly outweighs the excellent aim but somewhat stilted execution of the more renowned novel. That Mrs. Burnett should not be contented with writing merely to be entertaining, as in 'Dolly,' is much to her credit, but it is to be hoped she will not throw overboard life and good spirits from a desire to do serious work. Already 'Dolly' shows considerable originality, in the fact that the heroine, who is a coquette, is also warm-hearted and faithful to her lover; this is much more interesting than the ordinary superficial statement of the case, which makes such heroines throw over a poor young man to take up with a richer one, and there can be but little doubt that Mrs. Burnett is here on surer ground than when she is writing about impossible girls who are mysteriously turned into paragons.

'Lil' is the conventional society novel which may be read once, but has nothing more than moderate liveliness to commend it. The plot is a familiar one, and the people every one has met with frequently—in novels, that is. There is, however, a certain gracefulness in it.

'Tangled' is an American production, of so light a build that it seems like a somewhat unduly enlarged magazine-story. It is agreeably amusing, not by means of the noisy horse-play which has made the fame of some national humorists, but from the very absence of it. The sketch, too, has been carefully written, and well deserves the half-hour's attention that would suffice for reading it through.

Mrs. Prentiss has written such charming books for children and young girls that there is no unkindness in wishing that she would confine herself to these, instead of attempting what is really a novel, and further undertaking to place its characters and scenes in a remote period of time. The slight coloring of antiquity fades away early in the story, and the personages might be said to act and talk in modern fashion if people ever did talk and write as these persons are supposed to do. What mortal child of thirteen ever wrote: "I used often to wish that I had a little sister. That was very wrong I had no business to want things God did not think it best for me to have!" And what indispensable villain ever kept such a journal as that in which Mrs. Woodford writes herself down as much fool as knave!

The story is told in a very irritating way by the journals of three persons, interspersed with bits of light comedy by Keziah, a Yankee servant (who if less overdrawn would be very amusing), and consists of the doings of two or three families in a New-England village. A fascinating adventuress, with a small daughter, succeeds in marrying "the Squire," Mr. Woodford, who is the best and devoutest of men. She quarrels with his old servant, drives his son out of the house, hoards money secretly, and looks on complacently while her daughter feloniously appropriates the lover of the Squire's daughter. The performances of this lover, Frank Weston, remind one of the old doggerel, with a change of pronouns—

> "At first, he thought he'd have her;
> Then, he didn't think he could;
> And then he changed his mind again,
> And, on the whole, he would."

He, however, winds up his career as an admirable clergyman; and the fact that first one baby and then another is left to the care of the heroine brings about the usual happy conclusion. Babies are favorite and very influential characters with Mrs. Prentiss. It is hard to say such things of the author of the delightful 'Susy' books, but we must earnestly invite Mrs. Prentiss to do what she does so well, and refrain from books like 'Pemaquid.'

If one were obliged to characterize 'Rebecca'; or, A Woman's Secret' in a word it would be—*unwholesome*. It is full of a windy rhetoric which flaps round the heights of debatable questions, but clears up nothing. The writer is not so much without ability as without that degree of mental training which is a prerequisite to saying any worthy word on such mat-

ters as she deals with. She has rivalled the Pre-raphaelite painter who created "an improbable woman in an impossible landscape." The book is unfit for the young and unattractive for the old, and leaves the reader desiring more than the traditional ounce of civet.

The characters in 'Lapsed but not Lost' are a family of Christians living in the immediate neighborhood of Carthage, in the reign of the Emperor Decius. They suffer from his persecution with varying constancy: they tell each other stories of former persecutions and martyrdoms; the young ladies have remarkable beauty and the young men remarkable talents, and their conversations deal only with the loftiest topics. No doubt such books are helpful to some people: to hear Tertullian and Cyprian spoken of familiarly gives a fillip to their imagination; they do not require definite outline or accurate coloring to give them a pleasing sense of having made distinguished acquaintances; and perhaps, later in life, the shining haze which fills the mind of young readers drapes and humanizes the figures verified by careful work. But certainly of making books like these there is no end.

'Lapsed but not Lost. By the author of 'The Schönberg Cotta Family.'' New York: Dodd, Mead & Co. 1877.

THE WEEKLY

Springfield Republican.

THE BEST GENERAL WEEKLY NEWSPAPER IN AMERICA.

Founded in 1824 by SAMUEL BOWLES.

The WEEKLY REPUBLICAN is made up with especial care for a general circulation, and may fairly claim to be the best eclectic weekly newspaper in the country. It offers itself especially to politicians and scholars, to New Englanders, at home or in distant parts of the country, and to Americans abroad, as giving, in a single sheet, a more comprehensive and impartial summary of general New England and American news, and fuller and more independent discussion of all prominent topics of American life, and a more varied picture of our literary, art, and social progress, than can be found anywhere else.

Subscription rate, $1 for six months; $2 a year.

☞ Liberal commissions to local agents.

Checks and post-office orders to be made payable to SAMUEL BOWLES. Address

THE CYCLOPÆDIA OF BIOGRAPHY.

A Record of the Lives of Eminent Men. By Parke Godwin. New edition, revised and continued to August, 1877. 8vo, 1,200 pages, cloth extra, $5; half-morocco, $7 50.

The publishers claim for this work that it presents an admirable combination of compactness and comprehensiveness. The previous editions have recommended themselves to the public favor as well for the fulness of their lists of essential names as for the accuracy of the material given. The present edition will, it is believed, be found still more satisfactory as to these points, and possesses for American readers the special advantage over similar English works in the full proportion of space given to American names.

II.

COMPARATIVE PSYCHOLOGY; or, The Growth and Grades of Intelligence. By President John Bascom, of the University of Wisconsin, and author of 'Philosophy of English Literature,' 'Philosophy of Religion,' 'Principles of Psychology,'' etc., etc. 12mo, cloth, $1 75.

HARPER'S

New Monthly Magazine

FOR FEBRUARY.

NEW SERIALS.—The opening chapters of William Black's new Novel, "Macleod of Dare," with an Illustration by the celebrated artist Pettie; the first instalment of "The Return of the Native," Thomas Hardy's new Novel, Illustrated.

STRONG SHORT STORIES.—A complete Novelette, by Mrs. R. B. Latimer, entitled "Punished Enough,' with two spirited Illustrations by Abbey; and an exceedingly entertaining and piquant story, "Nobody's Business," by Horace E. Scudder.

ADVENTURE.—The opening article of this Number is a picturesque description of American life and scenery, by William H. Rideing, entitled "Along our Jersey Shore," with twenty-four beautiful and characteristic Illustrations.

ART AND ARTISTS.—The Number contains two articles on Art subjects: A paper by Helen S. Conant on "Joseph Mallord William Turner," with a score of Illustrations engraved after Turner's most famous paintings, including the "Slave-ship," never before engraved; and "A Painter on Painting," an exceedingly interesting report of a talk on Art by the celebrated landscape painter, George Inness.

POETRY.—A touching domestic poem by A—— F——, entitled "A Return," with an admirable Illustration by Abbey.

LEAVES FROM HISTORY.—As is usual in *Harper's Magazine*, a large proportion of space is given to subjects of general literary and historical interest, including a characteristic chapter of Italian history contributed by O. M. Spencer, "The Fieschi Conspiracy," with spirited Illustrations; a stirring narrative by J. W. De Forest of the "Turkish Wars with the Hospitallers; or, The Sieges of Rhodes and Malta."

OLD ENGLISH CUSTOM.—M. D. Conway contributes, under the title of "The Dunmow Flitch, 1877," an entertaining description of the revival, last year, at Dunmow, of the ancient custom of presenting a flitch of bacon as a reward of marital fidelity.

HOME CHARITIES.—An important and timely paper, entitled "A Glimpse at Some of our Charities" (to be concluded in the March Number), is both a statement of results and a study of methods.

EDITORIAL DEPARTMENTS.—Five Editorial Departments conclude a Number of unusual variety, beauty, and interest.

NOTE.

Harper's Magazine contains more matter than any other American periodical; and its immense and constantly-increasing circulation—equal to the combined circulation of all other American Monthlies of its class—enables its publishers to maintain and steadily advance its position, as to the quality of its literary and artistic contents, beyond the reach of competition or imitation. There has been no year since 1870 when its circulation has not been larger than during any year of the previous decade.

UNION SQUARE.

The Nation.

NEW YORK, THURSDAY, JANUARY 31, 1878.

The Week.

THE end of another week finds Congress still absorbed by the "silver question," to the exclusion of almost all other interests and considerations. On Wednesday week Mr. Blaine appeared in the Senate with a compromise bill which deservedly finds favor with neither party. It permits the unlimited coinage of silver dollars of a certain value (undefined in the bill) in exchange for bullion at its current market value, as from time to time determined, plus the cost of coinage; these dollars to be legal tender, by themselves, only to the extent of five dollars, but in conjunction with gold to the extent of one-half of any debt. In contrast with this weak-kneed performance, Mr. Lamar, the next day, honored himself and the South by boldly taking his stand in favor of a gold standard and national honesty. The vote on the Matthews resolution at length took place on Friday. Mr. Conkling's motion to make it a joint (and therefore vetoable) resolution was defeated by 39 to 23; Mr. Edmunds's contradictory amendment, declaring the bonds payable in gold coin and characterizing their payment in depreciated silver as a breach of the public faith, was defeated by 44 to 18, Mr. Blaine declining to vote on account of some historic doubts on these points; Mr. Morrill's amendment, denouncing payment in silver as false economy, was defeated by 41 to 14; Mr. Edmunds's motion for indefinite postponement was defeated by 43 to 22; and finally, by 43 to 22 again (Mr. Blaine this time voting with the minority), the Senate affirmed, in the language of the original resolution, that all the bonds issued for the purpose of funding the national debt are payable, legally and equitably, at the option of the Government, in the dollar of the fathers, both principal and interest. On Monday the House, without debate, and by more than a two-thirds vote, 189 to 79, adopted the same resolution. More unexpected was the action of the House, also on Monday, when called upon by Mr. Baker, of Indiana, to suspend the rules and resolve that subsidies of whatsoever kind, to associations engaged in public or private enterprises, ought not to be granted or renewed by Congress. This resolution was carried by a vote of 175 to 82. On Friday the Judiciary Committee reported that there had been no breach of the privileges of the House in the case of Robert Smalls. On Tuesday, the House passed, not without opposition (167 to 100), the bill permitting the Woodruff expedition to register a foreign-built ship. As we lately pointed out, there is not a shadow of excuse for this special legislation, the real design of which is not to get a cheaper ship but to invest a private speculation with a national sanction. We hope the Senate will ask for light as to Mr. Woodruff and his intentions, and will also notice the warning of a correspondent on another page.

The Matthews resolution, which in terms only attacks the new bonds issued for refunding purposes under the Acts of 1870 and 1875, but of course casts discredit on all Government obligations, is already making itself felt in foreign markets. It was supported by 116 Democrats and 73 Republicans, and opposed by 56 Republicans and 23 Democrats. In other words, neither party could have carried it through as a party question; it has needed a combination, and these combinations are now so readily made that it is increasingly difficult to say what the existing party organizations are kept up for or what they mean. But the great fact remains that the majority of both parties voted for the resolution. It got but little support from the New England or the Middle States, and a great deal from the South and West. On the whole, if the vote be taken as an indication of the fate of the Bland Bill the prospect is rather gloomy; but we still adhere to the belief that if the bill be vetoed, there will be enough desertions to prevent its second passage. If the veto were accompanied by a masterly message, making a clear stand for the national credit, the chance of its defeat would be still greater. To override the veto 195 votes will be necessary, or six more than the Matthews resolution received.

It is noteworthy that during the debate in the Senate the burden of the opposition to the Matthews resolution and the silver movement generally has been borne by Senators Edmunds and Morrill, both from a small agricultural State. Mr. Conkling, representing a great commercial constituency, said nothing or next to nothing. We observe, however, that, as usual, his admirers are again beginning to stir him up and urge him to speak and bring his "great powers to bear," etc. It is probable, however, that he is keeping his great powers for things that interest him more. Mr. Blaine's attempts at legislation, and, indeed, at political suggestion generally, bear a strong resemblance to Mr. Burnand's "Happy Thoughts"—that is, they have a haphazard, jerky, and slightly droll air. "Happy thought—Constitutional amendment to protect schools from the Pope; happy thought—stir up Ben Hill; happy thought—make Evarts go to war with Mexico; happy thought—compromise with silver-men; make half-and-half legal tender for all amounts; trouble over, business revived, country grateful."

That the cry for "salvation by silver" was started by politicians for their own ends, that the movement was fanned by false statements as to the manner in which the silver dollar was dropped from the coinage, and that it is now a delusion which has temporarily deprived of reason a large number of the people of this country, are facts which few, even of the "silver-men" in Congress, will deny. The Bland bill cannot give to any section of the country, or to any class of persons, the relief which is expected from it, and it must bring with it disaster and irreparable injury to the whole country. The time is now too short for us to hope to control votes on the Bland bill by arguments addressed to the people of the West and South. But one course is left to those who would save the country from lasting disgrace and injury, and that is to demand of the men of ability and courage who represent in Congress the people of the South and West that they shall speak and vote boldly against any silver bill that would permit the United States to pay any portion of its debt in debased dollars. There are many men in the Senate of the United States who know that the Bland bill means the demonetization of gold by debasing the coinage. This week they will try honestly to amend the bill. If they fail to amend it, they will be face to face with the question "Shall I vote for it or against it?" The courage of a few men will determine the answer of many. Who will follow Mr. Lamar in boldly telling his constituents that they are mistaken as to the effect of the silver movement upon their interests?

The Silver League, or Greenback and Silver Association, as it is called, held another meeting on Monday, at which it was proposed that money should be raised to pay for documents to be distributed in those parts of the country in which there appeared to be most darkness as to the beneficent powers of silver; but nobody was prompt to offer anything except General Butler, and he only $5C. The discussion, too, was mainly conducted by him, and ran mostly on the best means of keeping the Secretary of the Treasury up to his work and making him carry out the Bland Bill, so "that silver may be a living power in the land." For this purpose Butler hinted that it might be necessary for the House to use its power of making him report to it in person. In fact, the Secretary was evidently an object of suspicion to the meeting, and they mean in case the bill is passed to keep a close eye on him. The one way in which he could work mischief under the bill would be to call in a batch of United States bonds and pay them off in silver. A blow would be thus given to the national credit from which it would probably not recover in a century, if ever.

Several leading citizens of New Haven, including Dr. Woolsey, Mr. English, Dr. Bacon, and others, have petitioned Congress for what may be called the only rational and honest mode of making silver a legal tender, and that is for the appointment of an international commission, having power to determine and promulgate authoritatively, from time to time, the relative value of silver and gold, so that in the payment of debts, at home and abroad, the quantity of coined silver which shall be the equivalent of any given quantity of gold coin may be everywhere definitely acknowledged; and until such a commission shall be appointed, the creation of machinery by Congress for ascertaining and promulgating, at intervals of three months, the value of silver in gold, as determined by the average sales of silver at the principal centres of commerce east and west of the Rocky Mountains. In other words, they ask for one standard and two legal tenders. We know of no objection to this plan on its merits; and we can anticipate no answer to it from the silver-men except "goldites," "gold-bugs," "gold sharps," "Shylocks," "Mississippi Valley," and so on.

The Louisiana Returning Board has again come before the public in a way that reminds one of the good old Grant days. The members were all four indicted for forging and altering returns at the late Presidential election, and recently applied to have their case transferred to the United States Court. This motion the State Court denied, and ordered the case to trial, and at the appointed hour they failed to put in an appearance, and it was found they had taken refuge from arrest in the Custom-house. This was sufficiently amusing, but what followed was more amusing still, for the acting collector and the United States marshal resisted the sheriff when he came to arrest the fugitives, and brought up a party of marines to protect them, and, indeed, the marshal arrested the sheriff. The State was for so many years governed from the Custom-house without any reference to the law of the land that both collector and marshal had evidently come to look on it as a privileged spot on which the writs of the courts did not run. It was not for some little time that they thought of telegraphing to Washington for instructions, and of course the Attorney-General promptly rebuked the Federal officials for their interference. Anderson, Kenner, and Casanave were therefore taken into custody; but Wells managed to make his escape, and is said to be on his way to Washington to claim protection, in default of which he threatens to make "developments." He is the greatest rascal of the four, and it is therefore a pity that he should have got off, but it would be a not inappropriate incident in his career that he should now "develop" in Washington. The whole party are very blue about their prospects, being afraid of a prejudiced jury. There are, however, two colored men on it. It will be a pity if they have any reasonable ground for disputing the justice of the verdict, if they are found guilty; but every lover of good government will be sorry if they get off without punishment. That Anderson should have an office in New Orleans under this Administration is one of the scandals of the day. The trial is now proceeding, and there is talk of summoning W. E. Chandler to prove the story produced in his late letter.

The Richmond Chamber of Commerce, in full accord with its sister bodies at Charleston and New Orleans as to the sacredness of public obligations, whether State or national, has just issued an address upon the public debt of Virginia. They say that the aggressive activity of those who demand its repudiation, and the apathy of the rest of the community, "have impaired private credit to such a degree that the merchants and manufacturers of Richmond, in justice to themselves, are compelled to express their views upon this vital question, and to take such action as in their opinion will tend to check the current of popular sentiment which seems to be hurrying Virginia to moral and material bankruptcy." They show that the debt proper is less than $34,000,000; that it has always been recognized by the Legislature as legitimate, and justly, since the "bonds were sold to *bona-fide* purchasers, many of them at prices above their par value, and the money paid for them was invested in building railroads, canals, turnpikes, colleges, schools, asylums, prisons, and other valuable works of internal improvement" (including the monument to Washington in the Capitol grounds), "from which the State is now deriving incalculable advantage"; that the whole debt is not due nor required to be paid at once; that the interest alone need be provided for, and can be met by an additional tax of about $700,000 annually, or three-fourths of one per cent.; that supporting the public credit now at this small sacrifice will enable the State in 1881 to pay its debt in bonds bearing four per cent. interest at par. They attribute the present demoralization on the subject of the debt to the bad legislation after the war, designed to impair the sanctity of contracts and impede creditors in the courts, and they find in it the cause of dishonest returns to assessors and dishonest assessments, of courts and grand juries winking at notorious evasions, of honest men forced to continue paying the taxes of the dishonest, "of communism, strikes, and the crimes incident thereto." In short, the address is in a high degree sound, earnest, and forcible. It is refreshing, too, to meet with an unblushing appeal to "debt-paying people," that respectable body of citizens throughout the country who have come to be regarded with distrust, while the merits of the "debtor class" have been asserted with so much vigor and persistency that a man who insists upon returning 100 cents for a borrowed dollar, instead of 90, is looked upon less as a fool than as a pernicious knave.

The adoption by the United States Senate of the Matthews resolution had no perceptible effect on the financial markets. Apparently it was reasoned that the vote showed that there was not strength enough to pass the Bland Bill. The vote of the House, however, on Monday, with its more than two-thirds majority, aided by plausible rumors that the President's opposition to the silver scheme was growing weaker, had the effect of shaking confidence in the defeat of remonetization, which had hitherto existed both here and in London. United States bonds in London fell on Tuesday 1 to 1¾ per cent., and the price of gold here advanced from 101¼ to 102¼. That the Bland Bill, if it becomes a law, will defeat the resumption of gold payments by the Treasury is beyond question, since the Resumption Act provides for gold payments only, in the absence of any authorized silver dollar at the time the Act was passed. That it will also make it impossible to maintain resumption in gold and silver should an attempt be made to carry out the Act is equally clear, unless by the first of January, 1879, the price of silver so advances as to make a 412½-grain dollar equivalent in value, or nearly so, to the gold dollar. Silver during the week has been steady in London at 53⅜ to 53⅛*d.* per oz. At the close of the week the gold value of a 412½ grain-silver dollar would have been $0.8933. The Secretary of the Treasury on Monday opened for popular subscriptions the United States 4 per cent. loan. The price at which the bonds are offered is 99¾ gold, the banks and agents which sell them to the public getting them from the Treasury at 99½ gold—the same as did the Syndicate. The day after the bonds were brought out they could be bought at the Stock Exchange at 98¼ gold, taking the accrued interest into account.

The British Ministry is apparently plunged in the greatest embarrassment by the Russian terms of peace, the principal points of which, so far as known, we have discussed in an article elsewhere. They appear, when communicated in substance by Count Shuvaloff, to have taken the Cabinet by surprise, and to have found them in a very nervous condition, as the despatch of the fleet to the Dardanelles on hearing one story, and its sudden recall on hearing another, showed. Accordingly, it has been determined to ask for the supplemental vote for the army and navy, and Sir Stafford Northcote having announced that the Ministry will treat it as a vote of confidence, the Liberals are prepared with an amendment, and the

debate, which is expected to last to the end of the week, is now going on. There is little doubt, however, that the Government will secure a majority—estimated at fifty—and just as little that if defeated and forced to dissolve Parliament, their foreign policy would be condemned by the constituencies. The class of men of whom the Conservative majority in the House is mainly composed are, through social influences and prejudices, mostly Turcophiles, and it is safe to say, if one can judge by the ordinary manifestations of popular feeling, do not on this question represent the country. Mr. Trevelyan, the biographer of Macaulay, in a recent speech described the Turkish sympathizers happily :

"Our army is all for the Turks. Our navy is all for the Turks. Our country-houses are all for the Turks. All loafers of every degree and rank, all that class of men who go about in clubs, or drawing-rooms, or taverns, intent on forming what they are pleased to call public opinion, are one and all for the Turks. The London newspapers are, for the most part, writing on the same side with an alacrity which I have never seen applied to any previous controversy. Epithets of extraordinary bitterness, wholesale accusations of cant, hypocrisy, absence of patriotism, want of common manliness are applied to men whose only crime is that they wish their countrymen to wash their hands of all responsibility for Turkish misrule and Christian misery."

Mr. Foster is to move the Liberal amendment in the House of Commons, and the Marquis of Hartington to close the debate. The amendment simply declares that as it is acknowledged that the conditions of British neutrality have not been infringed by either belligerent, "the House sees no reason for adding to the people's burdens by voting additional supplies." On this motion, pure and simple, the Ministry would probably receive the votes of a good many Liberals who would like to see England prepared for all eventualities; but the vote having been made a question of confidence, the probabilities are that the whole Liberal strength will be thrown solidly against the Ministry, and great exertions are making on both sides to secure a full house for the division. Lord Derby has withdrawn his resignation, on the countermanding of the order to the fleet to enter the Dardanelles, but it is still feared that if the Ministry get a good majority Beaconsfield will take the bit in his teeth and make some hostile demonstration against Russia. Whether the Liberals will be helped or hindered by the deplorable condition of trade it would be hard to say. The ultimate effects of the war would, of course, be bad, but many will like the prospects of the immediate fillip it would give to certain branches. The debate promises to be the most exciting since the Crimean war.

There is undoubtedly still a considerable degree of vagueness about the Russian demands, and they are capable of great expansion in execution, as Sir Stafford Northcote has pointed out. This is doubtless partly due to the fact that the negotiations being carried on in the Russian headquarters are shaped by what is called "the military party," between whom and the civilian diplomatists, headed by Gortchakoff, there is a constant struggle for ascendency. Now, the military party naturally does not want peace just yet, or not before they get to Constantinople. Having got into the way of thrashing the Turks, they like it, and wish to keep at it as long as there are any Turks to thrash. Moreover, as it is quite certain that the conditions of peace will have to be settled or passed upon by a European conference, Russia naturally makes her terms on every point as high as possible, and perhaps as vague as possible, partly to frighten the Turks and partly to allow plenty of room for reduction. The weight of England's remonstrances will doubtless, now that the Turks are out of the way, depend on the probability of her receiving support from Austria. Russia does not care for the fleet, and no army she could send to Turkey would make much impression, especially against the general rising of the Christians, which is impending and might be easily provoked.

If Mr. Sumner's doctrine of neutral hostility were applied to England in the present case the results would be very comic. In the first place, she is liable to the Russians for the prolongation of the war by sympathizing with and encouraging the Turks. Sir William Harcourt says that this prolongation has amounted to the six weeks since the fall of Plevna. The Russians would probably put it down at half the period since the Danube was crossed, that is, about three months, which, supposing the total Russian outlay to be $500,000,000, would make her debt to Russia $250,000,000. After the late civil war here, however, the total destruction of one of the belligerents left her only the other to settle with; but in this case Turkey has survived, and may fairly claim compensation also for the disappointment of reasonable expectations. It is true that she was officially warned at the outset that England would remain neutral; but the language of the Prime Minister and of an important portion of the press since then has fairly warranted her in believing that, if hard pressed, England would come to her aid. So that half the cost of the war, as well as compensation for the loss of provinces with which she is threatened, would seem not more than she has a right to ask, which would bring the expense of the war to England up to about $700,000,000 at a moderate computation, which, added to the Sumner liability in our war, would make a grand total of about $3,000,000,000, incurred without ever firing a shot, by simply looking on and shouting and calling names.

The most one can gather with any approach to certainty from the telegraphic news as to the situation in Turkey is that the Russians are slowly moving down on Adrianople, carrying with them, doubtless, the Turkish plenipotentiaries; but they have apparently no disposition to conclude a formal armistice or to suspend operations while treating. In this, humanly speaking, they are right, for the Turks, who are now so frightened as to be willing to sign anything to save Constantinople, would probably pick up a little courage and perhaps some shreds of military organization if the Russians halted to negotiate. The panic among the Mussulman population of Rumelia continues, and they are flying *en masse* to Constantinople, many of them frantically eager to get over into Asia. The Circassians are adding to the horrors of the scene by plundering all impartially, without regard to race or creed, and bringing their booty into Constantinople, where the Government would like to disarm them, but has not force enough for the purpose. Austria has apparently been a little alarmed by the expansiveness of the reported terms of peace, but Russia is apparently determined to leave nothing undone to satisfy her, and Count Shuvaloff has given the most positive assurances in London that the opening of the Dardanelles is to be treated as a European question, and is to be settled by the Powers. The only point, indeed, on which the victor is reported to be obstinate is the cession of the Rumanian piece of Bessarabia.

In France the broken spirit of the Right has been illustrated in the election of the Duc d'Audriffet-Pasquier as President of the Senate by 172 to 64 votes cast, and there were 61 blank ballots, put in by irreconcilable Legitimists and Bonapartists who hated the duke too much to vote for him, but, having no candidate of their own, had not the courage to vote against him. A decree has been issued stopping all press prosecutions for offences committed between the 16th of May and the 14th of December, and, to crown all, General Ducrot has been removed from his command, as he was suspected of counselling or being ready to participate in a *coup d'état*, and relegated to engineering work—all proofs of the completeness of the Liberal triumph. The latest piece of French news is, however, the most important for us, and that is that the Senate has unanimously passed a bill still further suspending the obligation of the Mint to coin silver—action taken in view of what is impending in this country, and of the well-known readiness of the German Government to pour a quantity of silver, variously estimated from $100,000,000 to $200,000,000, into the market whenever there is any new opening. M. de Parieu, perhaps the highest authority in France on coinage questions, seized the opportunity of urging the adoption of a gold standard.

THE TERMS OF PEACE.

THE terms of peace between Russia and Turkey, though not as yet officially announced, are doubtless known with all but certainty, and they are about what it was generally expected they would be, and what the conclusions of the Conference at Constantinople satisfied most people that they ought to be. Rumania and Servia are to become independent states; and Servia is, if Austria will consent to it, to get a little more territory. Rumania is to give up to Russia the piece of Bessarabia taken from the latter by the Treaty of Paris, and is to get in return probably a piece of the Dobrudja, which would shut Turkey out completely from the mouths of the Danube. Bulgaria is to have, as the Conference proposed, "local autonomy" under a Christian governor, holding his place for a long term of years and approved by the Powers, and a similar régime will be applied to Bosnia and Herzegovina. This is called the Syrian plan, being the plan applied to Syria in 1860 on the demand of the Powers, after the massacres and brutalities of that year and the despatch of a French force to restore order, though later advices make it a much nearer approach to virtual independence. To work successfully in Bulgaria it ought to be accompanied by the evacuation of the strong places of the Quadrilateral, and, in fact, the razing of their fortifications, which can hereafter be of no use to a state in the position which Turkey will occupy, while the garrisons would be a constant menace to the peace and good order of the province. Allowing the Turks to maintain garrisons in provinces over which the Sultan had lost his complete sovereignty has been tried already, and has been found to be a source of irritation to the people, and of expense to the Ottoman Government, without in any degree disguising its real weakness. Moreover, the experience both of the Franco-German war and of this one proves that great fortresses are of no use to a power which is forced to rely on them for salvation, or, in other words, which cannot put in the field an army which can hold its own independently of the fortresses, or which needs to use them for anything but delay. In the absence of such an army they are really a help rather than a hindrance to an invader, by furnishing him with the means of capturing large bodies of his enemy without the trouble and losses of hard marching and frequent fighting. If the Russians at Plevna had been as knowing as the Germans at Metz, the occupation of the place by Gazi Osman would have made him as ridiculous as the defence of Metz made Bazaine. In other words, had they let him alone until their reserves came up and then cut the Sophia road, the world would never have heard of him except as one of the common herd of pashas; while had the Prussians battered and assaulted Metz, Bazaine would have risen rapidly into a hero of the first order. There will, therefore, be nothing unreasonable or immoderate in the Russian demand, should it be made, that the Turkish troops shall evacuate Rustchuk, Silistria, Shumla, Varna, and Widdin. Montenegro will probably get all the territory she has won from the enemy, thus relieving her of the intolerable presence of the Ottomans in the very heart of her little territory at Spitza and Niksitch, and giving her a port on the sea and access to Lake Scutari—things which her people have for many generations sighed for, and often fought for, and have by their exploits in this war alone richly earned. The Greeks at this writing appear likely to get nothing, inasmuch as they have taken no part in the fray, and there is consequently great excitement at Athens at the prospect of peace. There is something at first sight a little ridiculous in their outburst of martial ardor just when the fighting is over, but it is not so much to their discredit as it seems that they should not have taken the field before now. Their situation differs materially from that of Montenegro, Servia, and Rumania, in that their territory is very accessible to the Turkish fleet, which could ravage the islands and bombard Syra and other ports without difficulty. To be sure, a judicious application of torpedoes might have warded off this danger to a considerable degree, as the Turkish fleet is not very enterprising; but still the danger was a formidable one for so small a community, and especially one which has such a frightful remembrance of Turkish atrocities and has lived so much of late years in politics on newspaper rhetoric.

There is not one of these changes to the approval of which the Powers are not in a great measure committed. The protocol of the Conference may fairly be said to cover them all, even if it were not supported by the Russian victories. It is only with regard to the demands of Russia on her own account that any difficulty is likely to arise, and even to these it is hard to see what objection even England can make. Indemnity for the expenses of the war is what every victor has a right to demand, and to get if she can, and there is nothing in the case of Turkey to exempt her from the operation of the general rule. There is one good reason for Russia taking territory in lieu of money, and that is that Turkey has no money, and if forced to raise it by loan or taxation it would aggravate the sufferings of the unfortunate people, Mussulman as well as Christian, who live under her rule. A slice of Armenia would, therefore, probably be considered by the civilized world as the best thing she can pay in, if she should not see fit to part with her ships, which, like the Danubian fortresses, are no longer of any use to her.

Russia has judiciously proposed to refer the question of the opening of the Dardanelles to the Powers, as it is a question which has really been under their jurisdiction ever since 1840, when the Treaty of London, of which England, Austria, Prussia, Russia, and Turkey were signataries, made the closing of the Straits to all vessels of war in time of peace a rule of public law. It had not before this been formally taken out of the Sultan's discretion except by a secret article in the treaty of alliance, offensive and defensive, concluded at Unkiar-Skelessi in 1833, between Turkey and Russia, and which caused so much indignation in France and England, by which the Czar designated the closing of the Dardanelles to all ships of war as the naval contribution which Turkey was to make to the common cause in case of hostilities with any other Power. As a matter of fact, previous to the completion of Sebastopol and the creation of the Black Sea fleet, it was Russia's aim to keep the Dardanelles closed. With the growth of her commerce and her territory on the Black Sea, her views have naturally changed; and it must be admitted that there is something wholly indefensible in the position that the war-vessels of a Power like her shall not be permitted to follow her trading vessels along an arm of the sea provided by nature for all comers, down into the Mediterranean, with the ports of which her commerce, already large, must every day be growing larger. Nothing can be said against it, or is said anywhere but in England, and the only argument used against it in England is that it would endanger the communication with India through the Suez Canal. But sensible Englishmen are beginning to see that if English supremacy in India can be put in peril by any naval force Russia can bring down through the Bosphorus, it is too precarious to last long under any circumstances, and—what is still more to the point—that there is no argument which will close the Bosphorus to Russia which might not be used to close the Canal to England. The complacent assertion of Sir Henry Elliot, the British ambassador at Constantinople at the time of the Bulgarian massacres, that "the necessity which existed for England to prevent changes most detrimental to themselves [ourselves] was not affected by the question whether it was 10,000 or 20,000 persons who perished in suppression" (of the Bulgarian insurrection), is one which probably no English diplomatist will ever again venture to make, and which would now be received with a smile, if not with horror, at the conference of the Powers to which Russia has herself referred the opening of the Straits. In fact, there has been nothing more absurd in modern politics than the policy of upholding a brutal despotism like Turkey in order to secure British supremacy in India, while at the same time justifying British supremacy in India on the ground that it gave the people justice and security. It bears an unpleasant resemblance to keeping a gambling-house in order to make money for a missionary society.

As a whole, the terms Russia offers may be said to be in entire accord with her promises before beginning the war, and moderate

considering the completeness of her victory. Taking everything into account, too, we think it may be fairly said that no war within the present century has rendered equal service to humanity and civilization. The others have relieved people of political oppression or gratified political aspirations; this one is likely to bring security for person and property to many millions of men who have never known it as it is known in the civilized world, and to open some of the finest regions on earth for the first time to the possibilities of modern progress. It is true that the best part of European Turkey —Rumelia—is still left in the hands of the pashas; but then its nearness to the capital and to the eye of the foreign ambassadors has long protected it against the worst abuses of Turkish rule, and will protect it now more than ever, as the pashas well know that the next time Russia takes them in hand, to Asia they will surely go. Moreover, it must be admitted that Europe is not yet ready for the Turk's total disappearance, and nobody is as yet prepared to say who should have Constantinople, or what should become of it. In twenty years more, events will probably have clearly indicated its proper destination. Either the Greeks or Slavs, or both, will by that time have made great progress, and probably have shown themselves equal to responsibilities which no one now would think of putting upon them. In other words, a successor to the Turk will probably have appeared, and when he does, the removal of the latter to Brusa will doubtless take place. Whether in Asia he will learn to live in the modern world, to accept its science and its morality, to separate in his thoughts the Koran from the sword, it is hard to say. If not, he will be gradually overwhelmed by the rise of the Christian races around him, and sink into the gloomy social decay of the Indian Mussulmans, or the harmless and innocent barbarism of the Tartars of the Crimea and Kazan.

CAN STATES BE MADE TO PAY THEIR DEBTS?

HALF the mischief to which organized communities are exposed comes from legal fictions. "The king can do no wrong" is one, "the State cannot be sued" is another and its next of kin. If any one is curious to know the exact working of the latter under our own superior system he has but to apply to the holders of bonds representing nearly three hundred millions of money that have been issued by more than half a dozen States of this Union. He will be told that the most of the securities, so-called, were put on the market by the States themselves and sold by their own agents at prices fixed by the venders, and that the money paid for them found its way into their treasuries and was disbursed according to their exclusive will and pleasure. He will be further told that none of the paper is honored by payment, some of it being openly repudiated and its redemption legally forbidden, and the rest treated with cool indifference. If he asks whether this condition of things is owing to the inability of the makers to pay their debts, he will be informed that all of them prospectively, and nearly all immediately, could, if they would, meet every dollar of their obligations. Why, then, he will naturally ask, are they not brought into court like other dishonest or delinquent debtors, and made to respond by application of the processes in such cases made and provided? The answer would be, Because the makers, negotiators, and beneficiaries of the bonds in question are "sovereign States," and as such cannot be sued.

The answer is, doubtless, quite sufficient, so far as the law of the case is concerned; but, for all that, it involves a stupendous and most unreasonable fiction. Not one of the States, except in the matter of its non-suability, is in any sense sovereign, or possessed of the attributes of an imperial power. Not one of them can declare or make war on its own responsibility, enter into a treaty or alliance offensive or defensive, send or receive an accredited ambassador, levy an impost duty, coin money, grant letters of marque or reprisal, emit bills of credit, pass a bill of attainder, or create a title of nobility—all indispensable prerogatives of a sovereign. The only truly royal privilege of which it is possessed is to run head over ears in debt, and then snap its fingers in the faces of its innocent and confiding creditors when pay-day comes.

Nowhere in the Federal Constitution are the States recognized as sovereign. Indeed, the word "sovereign" does not occur in that instrument—an omission the more noteworthy in view of the fact that the Articles of Confederation, to which it succeeded, in speaking of the States, positively stipulated that each "retained its *sovereignty*, freedom, and independence, and every power, jurisdiction, and right which was not by this Confederation expressly delegated to the United States in Congress assembled." That the word "sovereignty" was purposely dropped is logically apparent. The framers of the Constitution knew perfectly well that while there could be a confederation made up of sovereign States, there could be no nation thus compounded, and it was a nation they were constructing—a nation that was to have one head and many members.

The States, it is true, have certain powers which sovereigns exercise—legislative, judicial, and executive; but so have corporations like the city of New York, which no one pretends to be sovereign. The word "corporation," beyond all question, most fitly and clearly defines their functions. A corporation is a body legally created and deriving its authority from a superior power; and how else have the majority of the States of this Union come into existence? They have been created by law, and brought into the family of States by the pleasure of the paternal Government, instead of coming into it by treaty or mutual agreement. And those States which were originally independent, by consenting to stand on an equality with those afterward to be organized in the manner stated, consented to occupy a like subordinate station. That a corporation cannot be sued will not be contended for on any principle.

And even the one sovereign attribute of non-suability was not intended by the authors of the Constitution to be enjoyed by the States. They expressly provided in Section 2, Article III., of that instrument that the jurisdiction of the Federal courts should extend to "controversies between two or more States, between a State and citizens of another State, between citizens of the same State claiming lands under grants of different States, and between a State, or the citizens thereof, and foreign states, citizens, or subjects." That language the Supreme Court of the United States, in 1792, in the case of Chisholm *v.* Georgia, reported in 2 Dallas, held to include a State not only as a party plaintiff in a civil action but, in a proper case, as a defendant in a suit brought by a private individual for the enforcement of a moneyed demand, thus utterly rejecting the old doctrine that a State could not be sued. This conclusion was deduced both from the wording of the Constitution and the requirements of common sense and natural justice. Said Chief-Justice Jay, in delivering the opinion of the court, after referring to the fact that one of the declared purposes of the Constitution was to "establish justice," the construction that would enable a State to sue, but exempt it from being sued, "would contradict and do violence to the great and leading principles of a free and equal national Government, one of the great objects of which is to insure justice to all—to the few against the many, as well as to the many against the few. It would be strange, indeed, that the joint and equal sovereigns of this country should, in the very Constitution by which they professed to 'establish justice,' so far deviate from the plain path of equality and impartiality as to give to the collective citizens of one State a right of suing individual citizens of another State, and yet deny to those citizens a right of suing them." It is a bad rule, naïvely remarks the Chief-Justice, that does not work both ways; and what is a bad rule of morals cannot be good law.

In the same case Associate Justice Wilson, in a corroborative opinion, gives utterance to the following sentiment:

"A State, like a merchant, makes a contract; a dishonest State, like a dishonest merchant, wilfully refuses to discharge it. The latter is amenable to a court of justice; upon what principle of right shall the former, when summoned to answer the fair demands of its creditor, be permitted, Proteus-like, to assume a new appearance, and to insult him and justice by declaring, 'I am a sovereign State'? Assuredly it should not."

It will thus be seen that, whatever may have been considered by the framers of the Constitution as the reserved rights of the States, the privilege of turning their backs upon their honest creditors, and refusing them fair redress, was not among them. The authors of that document intended to give no countenance to repudiation. Had the Constitution been permitted to stand as it was originally adopted, the non-resident holders of the dishonored paper of Minnesota, Georgia, Tennessee, etc., could now go into the Federal Courts and prosecute their claims to judgment and collection in the same way that any other delinquent debtor can be proceeded against. In that case it would not be unreasonable to assume that the credit of some of our States would to-day rate considerably higher in the market.

But among the first Amendments to the Constitution, adopted in 1794, was the following, known as the Eleventh in order:

"The judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign state."

A State can now go into a Federal court and sue a citizen of another State or country, but the same citizen cannot enter the same court and sue the State, no matter how large his demand or how equitable his case. The rule now works but one way. Justice, as between individuals and States, is entirely a jug-handled affair. A more unfair discrimination was never created by law. The reason for engrafting such an inconsistency upon a code that professed to "establish justice" among men and communities was the embarrassed condition of the States at the time the Federal Union was formed. Every one of them was threatened by suits for large demands of shadowy merit, prosecuted for damages to person, or for the value of property appropriated by the State's representatives during the war of the Revolution. It was the apprehension of these war-claims that carried the amendment making the States unsuable by individual claimants. It was not the first instance in which, to escape a present and temporary evil, a lasting injury was done, and in which the remedy was infinitely worse than the disease. The possibility of the States abusing the immunity extended to them was, of course, suggested while the amendment was under discussion, but so exalted was the idea then entertained of State honor that the contingency of a State deliberately refusing to pay its just debts was hardly thought worth considering. Since that date public opinion has undergone a great change on that point.

The remedy for the evil pointed out is so obvious that it hardly needs to be mentioned. It is to repeal the Eleventh Amendment, by the same process that brought about its enactment, and thus restore the Constitution to its original integrity. The reason for the Amendment long ago ceased to exist, and the provision remains a blot upon an otherwise beneficent code, an instrument of far-reaching fraud. There is no principle upon which it can longer be defended. Think of the great city of New York being suable by the citizen to whom it may owe ten dollars, while commonwealths like Delaware and Nevada, with less than one-tenth the population or wealth, may owe the same person millions of dollars, and if not honest enough to pay voluntarily, the courts of the country can afford him no relief. It is difficult to see how such incongruity could be seriously maintained by even the most ardent stickler for State rights. The Eleventh Amendment out of the way, most of the bondholders of repudiating or delinquent States could go into the Federal courts and have their demands fairly considered. If a valid defence existed it could be set up. No wrong would be done to the States. If the demands were found to be just and legal, judgment would be rendered accordingly, and the creditor would be entitled to a *mandamus* to compel the State authorities to levy and collect the tax necessary to satisfy the debt.

What valid objection could be urged? Surely the States that have not had their names entered upon the rôle of repudiators, but which share in the common disgrace and loss of credit occasioned by the dishonest courses of their fellows—and which, fortunately, yet number more than the three-fourths necessary to ratify a change in the Constitution—would be only too glad of the opportunity to do an act of justice and vindicate the nation's honor. Good citizens of all the States would favor the movement on general principles. And few, we take it, could be found at this day so wedded to the idea of State sovereignty as to oppose a measure conceded to be honorable and just, out of deference to a fiction that has done so much to cover the land with blood and is now doing so much to cover it with disgrace.

VICTOR EMMANUEL.

ROME, January 10, 1878.

KING VICTOR EMMANUEL is no more, and with him a momentous piece of history and of legend is gone. The Italy we saw come into being and grow remains, but it is no longer the same Italy which, through good and bad fortune, was wedded to the sturdy soldier who has so unexpectedly left his kingdom.

Victor Emmanuel had gone towards the close of the year to Turin, where his wife, Countess Mirafiori, lay dangerously ill. He stayed there longer than he originally intended, owing to the exceptional gravity of the case. His royal duties, however, called him here for the receptions of New Year's day, and the state dinners which usually accompany and follow them. He intended, however, to leave again for Turin on Monday the 7th, after having presided on the previous day at the so-called diplomatic dinner, when the violent outburst of his illness prevented him from both—his son, Crown-Prince (now King) Humbert, being obliged to take the head of the table. Already on Saturday evening the King did not feel quite well, and in the night the heat and the want of breath had become so intolerable that he committed the imprudence of opening the window towards the gardens of the Quirinal and walking on the balcony in the damp night air, in order to get some relief; for which he paid dearly. The next morning he lay in violent fever; an inflammation of the right lung declared itself, and it was unfortunately complicated with a so-called *perniciosa*—*i.e.*, the fever resulting from the Roman malaria. The evil increased steadily during Sunday and Monday; and the doctor who nine years ago cured his Majesty of the same illness, which had befallen him then at his shooting-place of San Rossore, near Pisa, was summoned, together with the two first medical authorities of Italy, Prof. Cipriani, of Florence, and Prof. Bruno, of Turin. For nearly two days the King was scarcely conscious, in consequence of which the bystanders were prevented from calling in the Crown-Prince and Crown-Princess, the extremely rigid Savoyard court-etiquette not permitting the son to appear before his father without his express summons. The day before yesterday, however, the King recovered his senses, and the first wish he expressed was for his children. Prince Humbert and Princess Margherita scarcely left his room afterwards until his death, which took place yesterday, Wednesday, at half-past three. His other children, Queen Pia of Portugal; Princess Clotilde Bonaparte, Prince Jerome Napoleon's wife; and the Duke of Aosta, once King Amadeo of Spain, were called by telegraph; but only the latter and his uncle, Prince Carignan, arrived last night—even they too late. During the thirty-six hours preceding his end the King was fully conscious, and saw clearly his fate. He encouraged his son and daughter-in-law, conversed at some length with two of the ministers—the President of the Council, Sig. Depretis, being himself detained by illness—and especially with General Medici, his aide-de-camp. Repeatedly he recommended to his son and successor "Italy and Liberty" as the two immutable stars which ought to guide him in his political conduct. He asked, himself, for the consolations of religion. Already on Tuesday evening Mgr. Marinelli had been sent by the Pope, who received throughout the illness hourly bulletins of the King's state, to take off the interdiction from the Quirinal, an interdiction which, as everybody remembers, the Holy Father had pronounced when in 1870 his palace had been broken open and prepared for the King's residence. Yesterday, Wednesday, at twelve, Victor Emmanuel confessed himself and received the sacrament from the hands of his confessor, Padre Anzino; and two hours later the chief chaplain of the court gave him the extreme unction, after which the King felt better, it appeared. A newly-invented apparatus to bring oxygen to the lungs relieved him in part, but only for a few moments. Once more he asked after his absent children, pressed Prince Humbert's hand, and with the cry, "The children, the children" (*i figli, i figli*), he expired at half-past two. Almost at the same moment, too late, however, arrived a high prelate from the Vatican, bringing the special blessing of the Holy Father.

The news spread instantaneously among the thronged multitude which

covered the square before the Quirinal and the Consulta round Phidias's horses, and like an electric stroke went through the Eternal City. The grief is general and intense. Even the Republicans, who lately have so audaciously lifted their heads; even the clericals, who for some time past have been meditating a reappearance on the political battle-field, show consternation. It is as if the youth and the poetry of the national life were finished; and as every Italian, to whatever party he may belong, is always Italian before he is a Catholic or a Republican, all feel deeply the loss of the man who embodied Italy; who, by his daring as well as by his prudence, by his moderation and his statesman's eye, had succeeded in making out of a "geographical term" a great and living national organism. Everybody feels what the nation owes him, and that but for him Italy would never have existed, however great Cavour's genius, Garibaldi's heroism, the people's patriotism. He was at once the bold and the cold-blooded player, who staked his all on the card of Italian unity and who won the prize, not for himself alone but for the whole country. Like every true monarch whose family has been for hundreds, nay, for a thousand years identified with the weal and woe of an important commonwealth, he had the rare instinct of what his country's honor and interest demanded, because it was his own individual honor and interest. People must not believe that King Victor Emmanuel, because he was a constitutional monarch, had little or no influence upon the politics of his country. True, he was never mixed up in the party squables, nor even in the small questions of daily policy; but it was he who chose Cavour and maintained him against court influences and unpopularity; he who gave La Marmora *carte blanche* to reform the old, glorious, and well-tried Sardinian army; he who gave his consent that Garibaldi should enter Naples; he who decided the taking of Rome in 1870, in spite of his strong religious feelings and his personal attachment to Pius IX.; he who in March, 1876, declared the time come to try a ministry of the Left, instead of changing once more the beaten Cabinet for another shade of the same color, as had been done for seventeen years.

Prince Humbert was immediately proclaimed King, and has declared, as early as last evening, that he maintains the present Cabinet, which, whilst I am writing, is assembled at the Consulta in order to prepare the manifesto to the nation. Everybody knows how popular the graceful and intelligent Princess, now Queen, Margherita is with all classes and all parties. The new King is generally less known, and a somewhat stormy youth has created many prejudices against him, which are hardly justified. I have had the honor of talking at length with him several times, without witnesses, and I found in him a man of very sound judgment, fully informed of the state of Europe and of that of his own country, perfectly versed in contemporary as well as former history. Already for the last four or five years he has taken a serious interest in politics, and he seems to have the hereditary quickness of his family in judging men and in finding out what he has to say to each and every one. It stands to reason that King Humbert cannot enjoy the prestige of his father, who took up his crown on the battlefield of Novara, defended the constitution against his evil councillors from within and without; who cast his lot with his Sardinian people in 1855, with entire Italy in 1859 and 1860; who fought for Venice in 1866, and entered Rome in 1870. But the tie which unites Italy to King Humbert is none the weaker because it is one of interest and calculation more than of sympathy and love; and there is good ground to hope that many years will not have elapsed before the *mariage de raison* between Italy and her new King will become a marriage of sincere affection. King Humbert has a difficult task before him, no doubt. It is probable that he will find himself soon before one of the most momentous questions of our time. Pius IX. cannot long survive his royal rival; with his end the religious question will awake more dangerous than ever. The very advances made by the Vatican towards the Quirinal, on occasion of Victor Emmanuel's illness and death, are full of ominous significance for one who knows how things lie. Father Curci, *l'enfant terrible* of the Curia, has prematurely betrayed the word of the Catholic conspiracy; let us hope that King Humbert will beware and remain as watchful as his father, who always knew how to separate his personal feelings from his duties toward the state. As for the emergencies of the Eastern Question, we can say that the cape is doubled, and King Humbert, who has never concealed his sympathies for Germany, will not choose this moment to part from the Three Emperors' league, to which his father himself, in spite of his western tendencies, acceded a few months before his death. As for the inner affairs of Italy, the King can do little for good or for evil to change them; it is the nation's own business to disentangle itself. One thing is certain, that as long as there is a tolerably energetic and watchful Government nothing is to be dreaded from Republicanism, however audacious and fanatical its partisans may be; nay, they are so few in number that I do not even think the present Cabinet, in spite of its intellectual mediocrity, its moral weakness, its scanty authority, too feeble to resist their eventual enterprises, which, I firmly believe, they are themselves far too prudent to risk for some time to come.

THE OLD MASTERS AT BURLINGTON HOUSE.

[FROM AN OCCASIONAL CORRESPONDENT.]

LONDON, January 12, 1878.

IN speaking, a year ago, of the loan exhibition which now regularly takes place in the rooms of the Royal Academy during the months preceding the great show of the pictures of the year, I had occasion to say that the very rich stock of art-treasures from which these assemblages are drawn shows as yet no sign of being exhausted. In the light of the exhibition of the present year this remark needs, perhaps, to be slightly modified. The stock is doubtless not nearly exhausted, but the milk-pan, if I may be allowed in such a connection so vulgar an expression, has been pretty well skimmed. The first-rate things scattered among private collections over the length and breadth of this most richly-furnished country have, for the most part, taken their glorious turn upon the winter-lighted walls of Burlington House. There are, doubtless, some great prizes remaining, but they are not very numerous. The Titians, Rubenses, Rembrandts, Vandykes, the precious specimens of the Dutch painters, the flower of the Reynoldses and Gainsboroughs, have already obeyed the invitation. This year there are two or three superb Rembrandts; but it is apparent that for the future (unless they begin at the top of the list again) the exhibitions must be pitched in a minor key. To-day, in the absence of great Italians, we have a room devoted to the "Norwich School." I do not mention this fact invidiously, for the Norwich room is very interesting. I allude to it simply to indicate that London picture-lovers must begin and clip a little the wings of expectation. It has been the custom with these exhibitions to have, on each successive year, a specialty—the ear-mark of the particular exhibition. At first this distinguishing stamp was given by the greater masters; there was the Titian year, the Rubens year, the year when the early Tuscan painters came out with peculiar force. Then there was the Reynolds year, and the Gainsborough year; and there was even, a twelvemonth since, what it would be tolerably correct to call the Raeburn year. At the present moment, I suppose, one may talk of the Norwich year. The works of the painters who achieved the unique distinction of reflecting their eminence upon an English provincial town three-quarters of a century ago are ranged together in the first room; and although there are names in the exhibition much more familiarly known to fame than those of John Crome, Cotman, Stannard, Vincent, Stark, there is no part of it more interesting than that occupied by this modest but exquisite group. The founder of the so-called Norwich School was John Crome—"Old Crome"—a man of genius who, among manifold difficulties, spent the greater part of his life cultivating landscape art in the neighborhood of a little English episcopal city, at what would be termed to-day—at least from the artistic and even the landscape point of view—a very Philistine period of its history. He gathered about him a number of not unworthy pupils, appreciative observers of humble scenery, who, under his wholesome influence and with the minimum of patronage, succeeded in founding the sole local subdivision in the history of English painting. John Crome is a very charming painter, and each of his companions has an interest of his own; but to a stranger, I think, almost the chief merit of the group will be historic or social—found in the simple fact that it held its own and flourished in a situation in which there can have been the least possible human inspiration towards taking the pictorial view of things. It is hard to imagine an assemblage of painters, united by a common ideal, holding well together in an English cathedral town even at this emancipated and Ruskinized day; but to reflect that something of that kind happened during those dusky years of the Napoleonic wars, when England was shut up to her purely British and unæsthetic self, is to find one's self confronted with a genuine marvel. There are no less than twenty-seven of Old Crome's landscapes in the exhibition (I do not know how he came to gain his sobriquet; he lived but to the moderate age of fifty-two), and most of them are extremely delightful. With two exceptions (rather infelicitous memorials of a journey to Paris), they are illustrations of the homely Norfolk scenery—the moist meadows and brown-coated moors, the canal-like rivers, the thatched and gabled cottages, the shallow harbors of the region in which he was born. He

had evidently had some observation of the Dutch masters of landscape, and he had zealously appropriated their teachings. There is a certain "View on the Wensum," a small expanse of stagnant-looking river, shut in by brick-walled houses with pointed roofs, which would require very little more perfection of detail to make it pass for a Van der Heyden. Crome is seen at his best, however, in the rendering of open spaces—of heath and furze and scrubby trees, and morning and evening skies. Near the picture just named hangs an admirable "Distant View of Norwich," taken in the late afternoon, with the mass of the city lying large and vague in the early dusk, and the spire of the cathedral—a loved landmark—rising far into a sky of remarkable mellowness and airiness. There are also two other little pictures—a certain view of "St. Martin's Gate" and another on "The Back River"—of old steep-roofed, ruddy-walled houses, reflected in thick, quiet water that are full of a Dutch minuteness and reality. The perfect Dutch skill and taste are wanting; but there is a great charm of coloring, and most of the pictures, like those of the Dutch masters, have suffered very gratefully the action of time. They have a sort of rich brown bloom—a sober glow. I have not space to speak in detail of Crome's followers; but I must spare an allusion to James Stark, who in a small way, with his thin woods, his crooked roads, his timbered cottages, his grey skies, and his unambitious love of foliage, reminds one even vividly of Hobbema. Stark is very charming, though doubtless a little finical and common. Cotman is also charming, with the advantage of being stronger and more breezy; a fine Cotman, indeed—for instance, a certain "Windmill," in this same room, with a great watery, wind-stirred sky—is a very noble piece of work.

In the way of landscape the exhibition contains three or four other excellent things. One of the two Turners—a "Trout Stream," lent by Lord Essex—may be so spoken of, in virtue of its superb rendering of a gigantic grey cloud lifted up into the air and returning upon itself, like a waterspout. Of the unequalled art with which, in a subject like this, Turner contrasted with his pregnant vapor-masses the lighted spaces of the sky, this picture is a sufficient illustration. In connection with Cotman's "Windmill," I should mention a picture by Rembrandt bearing the same title; or rather, I may say, it will be more considerate of the English painter to mention it apart. The Rembrandt, which is one of the artist's strongest landscapes and is the property of the fortunate Lord Lansdowne, represents a mill standing almost in profile upon a low cliff that overlooks a river. The picture is very dark, and in the way in which the stunted tower of the mill stands up against the sky, and its clumsy arms spread themselves in the faded, ruddy evening light, while the lower part of the subject is bathed in the usual brown Rembrandtesque mystery, there is an ample suggestion of the painter's characteristic magic. A picture that need not fear juxtaposition even with Rembrandt is an admirable specimen of a Dutch painter who is rarely encountered—John de Capella: a grey, moist harbor-scene; the edge of a pier near which a boat is unloading, and an expanse of quiet water, with other boats vaguely seen beyond it. This small picture is a masterpiece; the look of the monotonous sky, stuffed, as it were, with small rain-clouds; of the warm, damp air, with softened, muffled sounds passing through it, is a marvel of quiet skill. There are two or three good specimens of the better-known Dutch landscape painters—a couple of interesting Jacob Ruysdaels and of desirable Hobbemas. In relation to Rembrandt, I must speak of certain portraits from his great hand, which are presumably to be accounted the gems of the exhibition. One is a superb portrait of himself as a young man—painted in 1635; the other a head of a Jewish rabbi, which is present at Burlington House in two editions. One of these latter works has been contributed by the Duke of Devonshire, the other by Lord Powerscourt, and the second being an inferior replica—or a picture, at the best, much injured by time, or possibly by cleaning—the presence of its competitor may, in vulgar parlance, be pronounced "rough on" the Duke of Devonshire's fellow-peer. The portrait is in Rembrandt's greatest manner, and represents an old man with a much-twisted turban, an upper lip shaven like that of an American legislator, a large, ugly face, magnificently wrinkled and withered, and a big jewelled clasp glowing upon the bosom of his furred and dusky robe. The picture is full of that profundity of life which we find in Rembrandt's greatest works. There are naturally many other portraits; but with the exception of a beautiful head of a gentleman, auburn-haired and refined, by Rubens, there is nothing of absolutely the first importance. The Titians are, I should say, apocryphal, and the Vandykes, though decidedly striking, not of supreme excellence. The same may be said of the Gainsboroughs and Sir Joshuas, which are, as usual, abundant. The exhibition, with regard to Gainsborough, is chiefly but a reminder of the difference existing between good and indifferent specimens of this too prolific painter. Still, one takes a pleasure even in a collection of fairish Gainsboroughs, by reason of the large proportion of charming faces among his models. He painted some very weak pictures, but he never fairly sacrificed a face. There are two interesting Romneys—portraits of his perpetual model, Lady Hamilton, which, though the painting is of an almost primitive baldness, are highly suggestive of the lady's extraordinary, innocent-looking loveliness. She had evidently a genius for "sitting." There are many more interesting things which I have no space to commemorate, and I must content myself with a mere allusion to the brilliant winter-exhibition of the Grosvenor Gallery. This is composed of drawings and water-colors by masters not living, and in the department of drawings is especially strong. The Queen has lent a great many from the treasures of Windsor, most of which are of high value. But supreme among them and easily surpassing everything else—even two or three noble designs of Michael Angelo and several beautiful sketches of Raphael—are a series of deeply-interesting heads by Leonardo da Vinci. These things, as drawings, strike me, in their union of the grand and the exquisite, of intellectual intention with brilliant handiwork, as beyond price.

Correspondence.

THE WOODRUFF EXPEDITION.

To the Editor of The Nation:

Sir: The severe criticism on the Woodruff scientific expedition in your No. 654 (Jan. 10) leaves untouched one point which it is an act of simple benevolence to bring to the attention of every parent who may contemplate patronizing it. Knowing, as I do, a little of the demoralizing influences to which the young are subject on such a voyage, I have no hesitation in saying that no considerate parent would allow a son to enter upon it except from a profound ignorance of the danger to character and morals thus incurred. If further light is wanted, I would refer all enquirers to the nearest naval officer of age and experience, preference being given to one who has visited foreign ports on a school or training-ship.

COLLEGE INSTRUCTION IN ORATORY.

To the Editor of The Nation:

Sir: In an article entitled "Collegiate Oratory," which appeared in the *Nation* for Jan. 17, 1878, you say: "Far from cultivating this [the art of debate], however, one of the noblest and manliest of arts, our colleges, in so far as they have given any attention to the matter at all, have devoted themselves to encouraging the 'demonstrative oratory' of the Greeks. . . . It was a curious and significant circumstance that not one of the subjects chosen by the young men who declaimed the other night at the Academy of Music, except one, had the smallest connection with the topics now agitating the world—the problems of trade, finance, religion, and war"; and the article implied that the tendency of college instruction is to produce a set of "hazy" thinkers.

At Harvard, where "demonstrative oratory" is unknown, the subjects given out for themes, forensics, and theses have a direct bearing on the questions of the day. In themes the subjects are taken mainly from a college life; and because such subjects may be treated exhaustively in a limited space, the student is, in this way, restrained from "hazy" thinking. Moreover, since subjects of the class referred to bear the same relation to college life that the editorials of a "daily" bear to the life of the world at large, the student, on graduating, finds himself confronted with questions differing from those he has been accustomed to not in kind but in degree. In addition to the required work, there is this year a new elective, in which the end of the instruction is, to use your own words, "to train the student carefully in the mastery of subjects and the arrangement of arguments."

In forensics, where the only thing considered is the merit of the composition in respect to its logical arrangement, the subjects have embraced such practical questions as the benefit of foreign commerce, the repeal of usury laws, and the transmission of property.

In many of the courses theses on special subjects are given out; especially is this the case in the advanced course in political economy, in which the subjects for the year include "Reciprocity with Canada,"

"The True Ground of Taxation," and "Whether Should the Government or the Banks Issue the Currency?" In the first course in political economy much time is devoted to the study of the financial history of the United States, and the English money market as explained in the pages of 'Lombard Street'—both practical subjects certainly.

Elocution plays a minor part. Those students who wish instruction meet the professor once a week for a private lesson of twenty minutes' duration. The training of the voice and the elements of gesticulation are all that is taught. Certainly Harvard can get along with no less elocutionary training and at the same time have any regard for the Commencement audiences. SENIOR.

HARVARD COLLEGE, Jan. 22, 1878.

THE DECORATION OF TRINITY CHURCH, BOSTON.

TO THE EDITOR OF THE NATION:

SIR: I notice in Mr. Clarence Cook's article on "Recent Church Decoration," in the current number of *Scribner's*, some statements in regard to the painting of the Boston Trinity Church which seem to need explanation, if not correction.

He says that one is "disappointed to find how small a part Mr. La Farge's individual work plays in the interior of the church," probably meaning that the pictures form a rather small proportion of the surface, but giving the impression that only a portion of the whole system of decoration is due to Mr. La Farge, and the rest to some one else; and it so happens that immediately afterwards come some remarks about the kindness of Fortune in sending to him, "all unpractised in the technics of wall-painting, such a right-hand helper as Mr. Daniel Cottier." The hasty reader might be excused for putting the two things together, and inferring from them and some sentences which follow that Mr. Cottier was in some way the author of at least a part of the decoration of the building, the credit of which has hitherto gone to Mr. La Farge.

As Mr. Cottier would no more wish to share other people's honors through a mistake than Mr. La Farge would like to be described as one who appropriated a brother-artist's labors without acknowledgment, it should be known that Mr. Cottier's actual connection with the work did not extend much beyond the supplying of workmen, who may have been, as Mr. Cook says, more skilful than others in mixing and applying colors. Instead of his having anything to do with the planning of the scheme of decoration, the coloring and design of the tower and the design of the roof and nave walls were all on paper long before Mr. Cottier was consulted, and, if I am not mistaken, while he was in Europe, and those drawings were carried out as nearly as a sketch at a small scale could be applied to the actual wall.

It was not till after a contract had been made with other parties, and the painting of some of the walls finished, that Mr. La Farge decided to terminate the first contract and make arrangements with Mr. Cottier to supply workmen. They had several consultations, and, no doubt, Mr. Cottier's advice was very useful; but as Mr. La Farge's plans were already fixed, and were not afterwards changed, it must have been, as Mr. Cook suggests, for the most part general advice about processes and mediums, which would apply to any building. Of course, he would have been very kind in helping in the design and coloring, if that had not been already fixed; and in decorating the ceiling of the tower, which had not been shown on the drawings, a proposition of his was once partly carried into effect, but it was afterwards painted over quite differently. Except this and another suggestion of his about the color of the woodwork, which was adopted, I cannot think of any point in which he influenced the design.

Mr. Cook seems himself to be a little astray as to the nature of Mr. Cottier's services, useful as they may have been to Mr. La Farge, when he says: "When all the panels, spandrels, etc., shall have been filled with pictures the obligation to Mr. Cottier will be more evident than it is now." This is rather a mysterious assertion at the best, and is still more difficult to understand when we consider that there is not a square inch of wall in the church which has on it anything that Mr. Cottier designed or any color which he selected.

To Mr. Lathrop is certainly due, as Mr. Cook says, the design for the roof, besides the band around the apse, and many other portions of the work, and various other gentlemen took part in designing the innumerable details; but every design was made and every color placed subject to Mr. La Farge's direction and approval, if not by his own hands, and the decoration as much belongs to him as "Hamlet" does to Shakspere, in spite of the assignment of the parts to different actors to interpret.

Mr. La Farge must be flattered at the number of persons whose friends would like to have them share his laurels. It seemed as if he was pretty liberal of them in writing eight other names beside his own in the modest inscription by which he signed his work. But that does not seem to have satisfied all the aspirants. I remember a party coming into the church one day, while the decoration was in progress, and enquiring for "the artist." "Was it Mr. La Farge they wished to see?" "No." "Mr. Lathrop?" "No." Mr. Millet and Mr. Maynard did not seem to meet the case, and it turned out that the one they wanted was the Scotch foreman who mixed the paint and applied the stencils. It seemed that he passed in some outside circles for the real artist, and very possibly he was capable of great things if he had been called upon for them; but, in point of fact, his canny device for handing his name down to posterity by painting it in large letters among the stencillings of the roof was the only original thought that the church owes to him.

Some answer might be given to portions of the criticism made without knowing all the circumstances; but Mr. La Farge can afford to bear a little unjust blame if he is sure of all the credit which belongs to him, and Mr. Cook's candid opinions are so valuable that it would be a pity to annoy him by unnecessary captiousness.

T. M. CLARK.

60 DEVONSHIRE ST., BOSTON.

THE FREEDMAN'S HOSPITAL.

TO THE EDITOR OF THE NATION:

SIR: Having been for years a subscriber to your paper, and disposed to accord with its general views in political matters, I have been accustomed to give it credit for meaning well, and for taking pains to gain correct information before making positive affirmations. But your paragraph in this week's issue, relative to the Freedman's Hospital in this city, is so wide of the facts that it shakes my faith in the last respect named. The trustees of Howard University are interested in the matter of the removal of Dr. Palmer (which, contrary to your statement, has not occurred) because he has been for several years the Dean of their Medical Faculty, rendering gratuitous services and giving the students under him access to the hospital.

They have represented to the President and to Secretary Schurz that they had no opposition to make to his removal for sufficient cause, but wished that no mistake should be made on the merits of the case, lest their interests should incidentally suffer, as well as injustice be done to Dr. Palmer. They therefore drew the attention of the Secretary to the fact that his own commission had fully exonerated Dr. Palmer, after spending a month in a careful examination of the case; that the reading of the condensed written testimony by himself and his solicitor, without having seen or heard the witnesses at the time, only half qualified him to judge of the case; that the unreported evidence (on which in part the commission had relied) consisted of their personal examination of the hospital and conversation with patients, and of their judgment of the manner, spirit, and character of the unfavorable witnesses, which, as is alleged, proved to be of the worst description, as was admitted by the Secretary; that Dr. Palmer would willingly submit to a new and most searching investigation by a committee of Congress, or of army surgeons named by the President; and that, as great interests were at stake and Dr. Palmer's reputation was unspotted, care should be had to be sure of all the facts before final action was taken.

Secretary Schurz, in the presence of the trustees, declared to the President that he charged nothing against Dr. Palmer's moral integrity, but that it was simply a question of efficient management, and that the case was not yet closed, but Dr. Palmer was to be allowed to put in further written evidence. The President, at the end of the interview, said that he was very friendly to Howard University, and would do all that he could to promote its interests; that he would see that Dr. Palmer was retained, if that were wise; and that, in case of his removal, he would see that his successor should be a man who would co-operate with the university.

No decision has yet been reached.

Dr. Palmer has since submitted to the Secretary over sixty new depositions contradicting the charges made, and it is hoped that the mind of the Secretary will be relieved. Meanwhile the Senate has ordered its Committee on Appropriations to investigate the subject, which is precisely what the friends of Dr. Palmer desire, and they calmly await the revelation of the truth.

As you seem to have been misled by insufficient information, I trust that you will insert this statement in your next issue.

Yours truly, WM. W. PATTON,
President of Howard University.

HOWARD UNIVERSITY, WASHINGTON, D. C., Jan 25, 1878.

[We are sorry if we have done injustice either to Dr. Palmer or Dr. Patton. Our paragraph was based on the report of the New York *Times*, which was very circumstantial and which we had every reason to believe to be correct. Meanwhile, we are able to say positively that the new depositions do not mend the matter; that the oral testimony of the witnesses, as since taken by Mr. Schurz himself, differs materially from the affidavits; and that all examined before him, except one, have disclaimed the affidavits.—ED. NATION.]

Notes.

THE unusual proceeding of giving the purchasers of the first edition of a book the benefit of the revisions and additions in the second edition has been resorted to by Mr. Henry Sidgwick, in his 'Supplement to the First Edition of the "Methods of Ethics"' (New York: Macmillan & Co.) This is a pamphlet of 123 pages, uniform with the original work. ——We are not among those who would recommend Trench's 'Study of Words' as a text-book; but for such as think it ought to be so employed an edition has been specially prepared by Thomas D. Supplée, of St. Augustine's College, Cal., and published in this city by W. J. Widdleton.——We are glad to see that the *Tribune Index* is to appear as regularly as the *Tribune Almanac*, and that its usefulness in the office of that paper ensures its continuance apart from any general demand for it. The *Index* for 1877 fills 116 pages, and should be indispensable to every well-regulated newspaper office. Of the *Almanac* for 1878 we need not speak. Some typographical errors that we have happened upon in using it are not surprising among so many dates and figures.——Estes & Lauriat have just issued Daudet's 'Nabab' in an English dress. Our Paris correspondent has already, in No. 653 of the *Nation*, done justice to this latest product of contemporary historical fiction.——A. S. Barnes & Co. will publish immediately 'The Commonwealth Reconstructed,' by C. C. P. Clark, a writer of no little force and originality.—— The *Radical Review* enters upon its second volume as a bi-monthly.—— The first number of the *American Journal of Mathematics*, to be published early next month, will contain articles by Profs. Sylvester and Newcomb, Mr. Charles S. Peirce, and others, including two writers from abroad.——According to Mr. Spofford's last report, the Library of Congress numbers upwards of 330,000 volumes, of which more than one-fifth are piled upon the floor. The neglect of this magnificent collection by Congress is as surprising as it is discreditable. The general catalogue is being printed; work has been resumed on the index to Congressional documents, debates, etc.; the third volume of original historical documents relating to French discoveries in the Northwest is nearly completed; and instead of reprinting the imperfect printed journals of the Continental Congress and the Congress of the Confederation, Mr. Spofford proposes to reproduce the MS. journals in the custody of the State Department.——Among recent German publications we find noteworthy R. Lepsius's 'Babylonian-Assyrian Measures of Length according to the Table of Senkereh'; volume one of H. Merguet's 'Lexicon to Cicero's Orations,' citing all passages; volume three of F. Ritschl's 'Opuscula Philologica,' "ad literas Latinas spectantia"; volume two of A. Vanicek's 'Græco-Latin Etymological Dictionary'; and H. Welzhofer's 'Thucydides and his History,' a contribution to the history of historiography. The third part of Von Holtzendorff's 'Handbuch des deutschen Strafprocessrechts' relates to the Penal Procedure regulation of Feb. 1, 1877.

—The vexed question as to whether Columbia College is to remain a city college or remove to the suburbs is in fair course of solution, and an early decision on the part of the trustees is expected. They have for several years been accumulating their surplus revenue as a building-fund for the erection of the new buildings as soon as a site should be definitely chosen. Unfortunately, the necessities of this fund have compelled the trustees to decline purchasing the library of the late George T. Strong in spite of the very favorable terms on which it was offered. A movement was at once started among the alumni to buy it and give it to the college. Mr. Evert A. Duyckinck, one of the library committee of the trustees, has carefully examined the Strong collection and strenuously advises its purchase. It would combine with the present college library to great advantage, as only 304 duplicates would result from the fusion. Its specialties are books on the fine arts and early American history, German literature and MSS., forty-eight in number, which Mr. Duyckinck reports "consist of Bibles, missals, books of hours, and Greek and Latin authors, representing every century from the twelfth to the seventeenth, and are richly decorated by the art of the illuminator." The library also includes books formerly belonging to Charles Lamb and containing MS. notes by Coleridge. It is offered to the alumni for $15,000, or less than half its estimated value if dispersed, and a fifth of the amount has already been subscribed, in part by individual trustees. The secretary of the special committee appointed by the Alumni Association is Mr. Henry R. Beekman, 55 Pine Street.

—The State Geological Survey of Wisconsin, begun under the late Dr. J. A. Lapham in 1873, has recently issued the first volume (vol. ii.) of its final report, 768 pp. royal octavo, illustrated by wood-cuts, several full-page lithographs, and maps in the text, and accompanied by an atlas of sixteen very large colored maps. The volume contains: 1. The Annual Reports of Dr. Lapham for 1873 and 1874 to the Legislature, and that of Dr. O. W. Wight for 1875. 2. The Report of Prof. T. C. Chamberlin, the present director, on the Geology of Eastern Wisconsin. 3. The Report of Prof. R. D. Irving on the Geology of Central Wisconsin. 4. The Report of Moses Strong on the Geology and Topography of the Lead Region. The work of these several gentlemen has evidently been done with skill and care, and the results are more concisely and systematically arranged than is usual in such reports. Among the new and interesting facts brought out are those with regard to the glacial drift, which reaches a remarkable development in northern and eastern Wisconsin, and is rendered the more striking by the entire absence of drift, and of all signs of glaciation over 12,000 square miles of the southwestern part of the State. The evidence presented by Prof. Chamberlin appears to show conclusively the former existence of a great glacier in the valley now occupied by Green Bay and Lake Winnebago, and another larger one in the Lake Michigan depression. The origin of the driftless region is for the first time successfully discussed by Prof. Irving, who shows that it owes its existence not to superior altitudes, as has heretofore been supposed—the truth being that the region is for the most part *lower* than the surrounding drift-covered country—but to the fact that the glaciers have been deflected from it by the Lake Michigan and Green Bay depressions upon one side, and by the greater trough of Lake Superior and its transverse branches, Keweenaw and Chagwamagon Bays, on the other. Mr. Strong's report on the Lead Region is given for the most part in the shape of atlas-maps, showing both its geology and topography in the greatest detail. Plate xvi. of the atlas by Mr. Strong covers a region of about 3,000 square miles, and exceeds in accuracy and closeness of detail, we believe, any similar map ever published in this country. The maps are all very fine, the chromo-lithographic work being unusually well done. The volume is throughout a Wisconsin publication, and indicates the excellent facilities now obtainable in the West for such work. The remaining volumes of the series (vols. i. and iii.) are to be issued, we believe, the present year. We would suggest to those whose duty it may be to attend to such matters the incompleteness of the table of contents and index of this volume.

—An anonymous writer in the February *Atlantic* argues, in the opening article, "The Cradle of the Human Race," in favor of the autochthonous origin of the various peoples of Europe. Mr. W. H. Babcock asks how the loss of models by the fire in the Patent Office last year is to be repaired, and proposes that they be reproduced as far as possible from the drawings not destroyed, and that additions be allowed on satisfactory evidence before a special tribunal that they formed part of the original models. It appears to us a fatal objection to this plan that no tribunal could be devised which could be trusted to decide such momentous questions on purely ex-parte testimony. Not only could inventors not afford to be present to contest claims on which their fortunes depend, and perhaps remotely and obscurely depend, but the public would be entirely excluded, to its certain detriment. The ordinary courts are, in fact, the only places in which to prove the construction of destroyed models, since only there exist the necessary conditions for ascertaining the truth—viz., a real issue of fact and conflict of interest, and an opportunity for both sides to be heard and examined. The most substantial article in this number, and the best one, too, in a literary point of view, is Prof. Norton's "Venice and St. Mark's." The double title indicates the writer's

purpose to connect the history of the city with that of the church, to show how this wonderful building reflected the independence, enterprise, and originality of the Venetians, and their peculiar gift of color in architecture as in painting, and to reproduce from the old chroniclers some of the historic scenes associated with St. Mark's. The treatment of this interesting subject is kept free from technicalities.

—The even tenor of *Harper's Magazine*, which neither midsummer nor midwinter nor holidays nor the occasion of a new volume disturbs, is well exemplified in the February number. It differs in physiognomy from a great many numbers that we can remember, and yet it is fairly typical of the magazine. The opening paper, "Along our Jersey Shore," so far as it relates to the Life-saving Service, has a somewhat threadbare theme, but the story is agreeably retold and not uselessly—that would be impossible while the service is still so grudgingly supported by Congress. For the rest, Mr. Rideing describes a cruise along shore and in Barnegat Bay as far as Atlantic City, and makes his readers disposed to wish they too might spend a vacation in the same way. In "The Dunmow Flitch" Mr. M. D. Conway amusingly tells how the flitch in question was by an old institution annually awarded in Dunmow, Essex, England, to any couple who could take oath that a year after their marriage they could look back on no disagreement, and still desired each other above all possible spouses in the universe. This truly English custom, albeit, as Mr. Conway shows, not without its roots in a pagan and superstitious antiquity, was dropped in 1772, and revived by the novelist Ainsworth in 1855, and has been fitfully maintained ever since. Mr. Conway witnessed the serio-comic festival last year, and thinks there will never be another. The flitch, whatever its mythologic origin, "is now a side of bacon which would bring ninepence a pound, and all the enthusiasm of Dunmow, as it was seen borne aloft, was superficial compared with the sensation which would be produced could it some day see such bacon marked sixpence in a shop-window." The sketch of J. M. W. Turner's life recites the principal facts in his career, and mentions almost all the defects of his character as a man. The woodcuts after his pictures seem to us noticeably successful, including "The Old Téméraire" and "The Slave-ship," now for the first time popularized in print. Mr. Ruskin's well-known description of this canvas is of course cited, and the editor of *Harper's* is fair enough to allow our artist countryman, Mr. George Inness, in the course of some sensible remarks about painting, on a subsequent page, to record his opinion that Turner's "Slave-ship" is "the most infernal piece of clap-trap ever painted. There is nothing in it. It has as much to do with human affections and thought as a ghost. It is not even a fine bouquet of color. The color is harsh, disagreeable, and discordant." Mr. Inness's "interviewer" evidently took his notes in short-hand.

—We have rarely seen a more notable disregard of the economy of force, or a greater disproportion of means to ends, than in certain bills for "the classification of mail matter" drawn by the Post-office Department and introdceud in the House by Mr. Money and in the Senate by Mr. Ferry. The object is to get rid of the annoyance of restraining certain advertising periodicals which endeavor to distribute themselves to non-subscribers at "privileged" rates of postage, and to silence the publishers of magazines who are annoyed at a recent rule restricting them from stitching or pasting in "inserts" or slips. To accomplish this it is actually proposed to create the office of "Superintendent of Mail Classification," who is to examine all printed matter claiming transmission at "privileged" rates, and who, if satisfied as to its character, is to issue "certificates of registration," under which it will oe entitled to be sent to *bona fide* subscribers at the lowest rate of postage. The opportunities which such an official would have of levying blackmail or of persecuting political opponents are enlarged by a provision, very proper in itself, prohibiting the mailing of any "obscene matter or matter relating to lotteries, gift concerts, or fraudulent schemes and devices." A careful scrutiny of the advertising columns of any of the "great dailies" would doubtless reveal much which a censor of strict virtue could classify under one or more of the above heads, and he would have power at once to deprive the offender of mail privileges. The department, of course, has no intention of setting up an indirect censorship of the press, but if this machinery is created it will not be long before some of the "war-horses" will discover how advantageously it could be worked. At present the only motive lurking under the surface would seem to be the desire of some one to occupy an office created by Act of Congress, to which is attached a salary of $2,250 per annum, to be paid out of the fees of registration.

—With the number for December 20, 1877, the French folk-lore periodical *Mélusine* terminated the first year of its existence. Among its most noteworthy contents we may mention the popular tales from various provinces of France. While all the other countries of Europe have displayed great activity in collecting their nursery tales, France has until recently almost entirely neglected them. The *Mélusine* has contained stories from Brittany, Picardy, Amiens, Metz, etc., some of them rendered doubly valuable by the annotations of R. Köhler. Brueyre has contributed Creole tales, one of which, from the parish of St. John the Baptist, La., is the same as the story of the Wolf and the Rabbit in *Lippincott's Magazine*, Dec., 1877 ("Folk-Lore of the Southern Negroes"). A large number of *chansons* has been published with music, many being interesting variants of well-known songs—*e. g.*, the 'Chanson de Renaud,' which is found from Brittany to Catalonia and Italy—while others are published for the first time. Next in value is the department of *Formulettes*, or nursery rhymes of all kinds, affording a rich material for comparison with German and English collections. Riddles are given from various localities, and superstitions have not been neglected. M. Bonnet contributes "Medical Superstitions of Franche-Comté," running through four numbers, and containing much that is common to all Europe. M. Thiriat furnishes "Beliefs, Superstitions, Prejudices, Uses, and Customs in the Department of Vosges," occupying three numbers. Several articles have been devoted to the traditional costumes of France, with illustrations, among them the curious dress worn at Bourg de Batz (Loire-Inférieure) by women at the ceremony of "churching," the head-dresses used in the Department of the Eure, etc. Of considerable value is the dictionary of names given to the inhabitants of the different localities of France prepared by M. Malet and running through the whole year. In addition to the above articles there has been an immense number of shorter articles and notes on local superstitions and customs, including an interesting note by M. Renan on the legend of the Seven Sleepers in Brittany. We must not omit mention of the department of reviews, with its notices of books of various countries relating to folk-lore. The *Mélusine* is successfully established, and will prove indispensable to all students of folk-lore, and we shall probably see this year a kindred publication in England as the organ of the new English Folk-Lore Society.

STEPHEN'S FREETHINKING AND PLAINSPEAKING.*

THESE essays are thoroughly English; full of sturdy Saxon vigor, and yet not unaffected in some ways by the conservatism which so especially hedges in the topics treated of. In style they are near of kin to Gregg's first essays, and to Fitz James Stephen's. They have not the passion or the imagination that one would find in the work of an American radical reformer; but then the American would hardly have thought it necessary to write a book in favor of free thought. It is so much less of an effort in this country to think freely, even if the thought is as radical as Mr. Stephen's, and mere plainspeaking is so quietly received, that our radicals have often to excite themselves to extravagance in order to reach a really comfortable martyrdom. But on the other side of the water damnation is still so freely accorded that a moderately-framed opposition has an effect denied it here. Then, too, the radical writings of the two countries show something of the same contrast that affects their other writings—there a solid, steady movement, striving to settle once for all the points touched with exhaustive scientific completeness, here a brilliant imaginative appeal, addressed as much to the æsthetic taste as to the reason, and strongly colored by our national desire to get thought without the trouble of thinking.

These essays (with an exception or two) first appeared in *Fraser's Magazine* and the *Fortnightly Review*, and in the interval between the first and the last there seems to be a change from a rather cautious to a very outspoken position, though the latter is plainly enough foreshadowed in the earlier writings. The first four and the concluding essay especially form a series which either attempts, with extraordinary care, to lead the reader quietly on to a positivism more and more pronounced at each step, or else, as seems much more probable from Mr. Stephen's temperament, shows a development of his own convictions. The deliberate moderation with which he questions the fairness of the position of the Broad Church in retaining the old forms while rejecting the old substance, ripens into harsher criticism upon those who would cultivate religion as a fine art when they can no longer yield it their faith; the relation of modern science to the older faiths emphasizes more distinctly his radicalism, and at last he ends by stoutly refusing the name of Christian, and vigorously

* 'Essays on Freethinking and Plainspeaking. By Leslie Stephen.' New York: G. P. Putnam's Sons. 1877. (v+, pp. 262.

asserting the duty of avowing his radicalism. His position is so extreme that he is no doubt right in expecting the approval of few Englishmeu but those who already agree with him ; but they will appreciate the vigor of his thoughts and the straightforwardness of their utterance, while those who take the other side will find little that is absolutely new to trouble them. The allusion on page 87 to "some contemptible French author," who explains the origin of modesty by referring it to a savage instinct, is an unnecessary bit of sentimentality from any point of view. M. Littré, who is the author of the suggestion, is well known as the greatest of Comte's followers ; and his theory, or something closely akin to it, is essential to every natural theory of man's intellectual rise from savagery. But sentimentalism is not at all one of Mr. Stephen's faults. He is indeed very English, and the atmosphere in which he writes is always to be borne in mind. The social influence of the Church, and the partial ostracism which radicalism has to meet there, make concealment much commoner than here ; and render it less extraordinary that a man of Mr. Stephen's ability should think that he must discard the name of Christian in order to preserve his honesty.

In this country the position of the English Church has always been different from its native one. From the first it has been essentially a missionary church among the heathen, and it is to-day more marked for the extraordinary intensity with which it preserves its faith in beliefs that are quietly fading from the creeds of its competitors, and the warm zeal with which it seeks to draw the unbeliever into its fold, than for its liberalism or progress. Of course there are broad thinkers within its borders, as every great city can show, but they do not form as prominent and influential a party here as in England. The rejection of the political compromise from which the Church sprang seems to have given it a fresher life here ; and in religion new life generally means firmer hold of doctrine, and stronger conviction that only faith can save. There have been comparatively few representatives of that section of the Broad party which, when the old methods seemed to be failing, boldly ventured to essay the new, and professed to bring the best light of historical criticism and of scientific investigation to bear upon the old dogmas only the better to exhibit their strength. As a movement it was scarcely in accord with the Church here, or indeed with our national instincts, from which the taste for the intellectual discussion of dogmas that our fathers felt so strongly has nearly departed. But even in England it did not succeed. The new wine was too effervescent. It was not, as Mr. Stephen says, because the English creed was, like the English constitution, "the product of a series of compromises, accidents, and bit-by-bit reforms, carried out by no definite principle, but by a sort of indefinite rule of thumb." However true it may be of the constitution, this does not at all represent the growth of the Church. When the Protestant creeds first took shape, the profoundest and subtlest thought of the time still found its best field in such topics. If we consider them unassisted by inspiration, we must still the more acknowledge the transcendent genius of the creation, for each of the great creeds is a perfect logical whole. Starting with its primal assumption that the collective voice of the Church was the voice of God, there was no assailable point in the Catholic creed. And when the stern facts compelled our fathers to doubt the purity of the Church's conscience and reject its authority, they still felt the need of an unquestionable source, and naturally sought and found it in the written Word. They did not go to history or science for evidences of Christianity. The "thus God spake" was final, and the Protestant creed which they built up on it (which, despite a few anomalies, is the creed of the English Church) is harmonious and complete. There would have been an impossible anachronism in supposing that the certainty of these *à priori* foundations could be replaced by any abstruse metaphysical probabilities or vague analogies from natural science. And to-day, much as philosophy and science may do, the certainty of the old faith they cannot give. Modern science has sadly shaken the belief in this infallibility of the holy text, both as to facts and laws. Modern thought has moved away from the creeds, but, however we may regret it, we cannot bring it back by scientific formulas with which they had nothing in common. The Broad Church has not been able to restrain the power it invoked, and again, as in the old legend, the dwarfs cry out that the Siegfried hammer has struck with such crushing energy that metal and anvil are driven into the earth.

The other liberal movement, which asserted that the creed was full of insoluble mysteries, was more successful here. This position had great advantages. It easily disposed of any troublesome points by calling them inscrutable. Of course antiquarians knew well enough that the great thinkers who worked out the creed would have stared in holy horror at the idea that they had left anything spiritually unintelligible or obscure, but modern thought has swept away from them so far that many thinkers, some even of the leading philosophers of the time, have easily followed the suggestion of the Church, and indolently asserted the impossibility of understanding them ; and naturally the method has found great favor in this country, especially in the more liberal sects. In the end, however, this movement, too, must fail, for the great creeds are great wholes from which no part can be severed without perilling the whole. The old legend comes back of the vigil in the valley of St. John, where the knight waits long before the enchanted castle, and at last in impotent, desperate uncertainty dashes his axe against the charmed rock, and finds that with the fall of a single turret the charm has broken and the whole castle lies open. The great creeds were the life of the Christian Church, and it is vain to hope that the Church can retain its influence when it does not insist upon the exclusive power of its creed to save. If the dogmas are acknowledged to be unimportant, men will give but a lax and indolent support to the church which so acknowledges its impotence. Belief must be in something definite and something certain, and it must be all-important. This is what has made Episcopacy and its offspring, Methodism, so successful of late years in this country. It has been perfectly sure. With all our loose breadth we crave sometimes something firmer, right or wrong, or rather something about which there can be no question of right or wrong. Keen as our artistic perceptions are, we are not always satisfied with "that beautiful but shadowy region where romance takes the place of history and poetry of reasoning."

For those who are unable to retain the old faith, but afraid to relinquish it, there is little satisfaction in books like Mr. Stephen's, which only try to show the untenableness of a foothold that they fear to change. The half conviction of insecurity they do not wish to recognize. They dislike to be told that "the division between faith and reason is a half measure till it is frankly admitted that faith has to do with fiction and reason with fact." Yet it is exactly against these half-way believers that Mr. Stephen's book is aimed. He has nothing to say against those who can still adhere fully to the old faith. He is too far away from them to meet them. He half unwillingly recognizes for a moment or two the other extreme of philosophical theism, the doctrine that the God-intoxicated Spinoza gave the clearest form to, but which is as old as the oldest thought—that philosophy which retains the direct personal knowledge of the divine essence, the all-informing eternal substance, "path, motive, guide, original, and end," while it drops all other dogmas. But he touches it only for an instant, for he himself goes further and keeps nothing. But still the old beliefs cover the whole ground, and one watches with interest the close approach of the modern positivist to the ancient stoic ; a likeness of thought rather than feeling it is true, but still a striking one. Both worship the Universal Nature, refusing any further step in Divine definition. Both seek the true life in harmony with universal order. Both make their aim the universal good. "Never repent," says Mr. Stephen, "unless by repentance you mean drawing lessons from past experience. Beating against the bars of fate you will only wound yourself and mar what yet remains to you." The love of those we have lost "is at best an enervating enjoyment, and a needless pain. The figments of theology are a consecration of our delusive dreams ; the teaching of the new faith should be the utilization of every emotion to the bettering of the world of the future." Instead of the utter self-surrender of Christianity Mr. Stephen puts the dignity of self-culture ; instead of asceticism, the training one's instincts "into harmony with the interests of the whole social organism." Resignation where there is a choice is but an "ignoble yielding to evils which might be extirpated." Suffering is an evil to be conquered, or at least stoically withstood, not a punishment to be submitted to ; and our reward lies not in any immortality of personal bliss but in the good we have done, "spreading in widening circles to all eternity." We have but to clothe these thoughts in Latin to transport ourselves to that early time when Christianity was still struggling for existence, and stoicism seemed the only resource.

POOR'S 'MONEY AND ITS LAWS.'*

WE have hesitated a good deal about reviewing Mr. Poor's book—first, because to review it adequately would require a volume of at least half its size ; and secondly, because it is quite plain that in Mr. Poor's opinion no man who has yet written on economical questions is competent to review it. Of its 623 capacious pages only 61 are devoted to what is undoubtedly the most important part of it—in fact, the reason for its

* 'Money and its Laws. Embracing a History of Monetary Theories and a History of the Currencies of the United States. By Henry V. Poor.' New York : H. V. & H. W. Poor. 1877.

existence—the author's account of his "Laws of Money." Of the remainder, 366 are given up to what it is no exaggeration to call scurrilous abuse of some of the most noted writers on economical questions, beginning with Aristotle and ending with David A. Wells. Aristotle he considers the father of modern political economy, and abuses roundly, though for reasons which we have no space to give here. We think his acquaintance with him, except in Bohn's translation of the 'Politics,' is very slight. "The premises from which he reasoned," Mr. Poor says, "were the untrained observations of phenomena or the extravagant pictures of an ardent and fanciful mind." "The conclusions were as grotesque and fanciful" as the premises, and he finally declares with much solemnity that when Plato and Aristotle "came to be authorities in the Church as well as in the Schools a night of intense darkness settled over Europe," a circumstance which he considers by no means "strange." Of Aristotle the Schoolmen were "the legitimate descendants," and all modern economists, except Mr. Poor, are the legitimate descendants of the Schoolmen. It ought to be put down to the credit of Aristotle, however, that in spite of the great increase of light in the world within the last two thousand years, the leading modern economists are just as great fools as their master, except John Locke, who appears to have written soundly on the currency, though even his distinction is not very great, because "he is the only writer on the subject of the currency, except Law, who has not assumed, much less attempted to prove, that two and two make five." Even he, however, "did commit an unpardonable offence, with the Schoolmen," of course. What it was it is hardly necessary to state, in view of the gross and asinine stupidity of those who came after him. John Law gets some faint praise and had some glimmerings of reason, so that Adam Smith and others were able "to construct from the ruins he left behind their grotesque and absurd edifices." Hume comes next, and, like Aristotle, "assumes all his premises without consideration or reflection," and "always follows Law where he is wrong and rejects him wherever he is right." "With Hume," too, "from the perversity or credulity of human nature, a falsehood plausibly told and well stuck to would have all the potency of truth," which is a sorry showing for the great experiential philosopher. Moreover, "as far as any knowledge of monetary science is concerned, a Kaffir might be quoted" (as well as he) "for an authoritative opinion upon the Code of Menu." Poor Hume! Such is fame.

Hume, however, was not, according to our author, half as great a blockhead as Adam Smith, who even outdid in folly and stupidity his master Aristotle. His economical teachings are nothing but "errors and absurdities." He even went so far as in his illustrations "to invert the whole order of nature"—a dastardly and mischievous trick. He hardly wrote a line without making a blunder, because "he was by nature wholly unfitted to conduct a scientific discussion of any kind"; and, "considering his ignorance upon the subject on which he wrote, the groundlessness of his assumptions and conclusions, especially in reference to money, the influence he has exerted is well fitted to excite astonishment"—in Mr. Poor, of course. Next comes the unfortunate Dugald Stewart, whose absurdity is only to be matched by Aristotle, by the Schoolmen, and by modern economists, and three-fourths of whose writings his literary executor ought to have burnt as "a vast mass of rubbish." Huskisson too, acute as he was, could not help making a fool of himself. He "fell into the grossest absurdity for want of a little reflection," and by "accepting dogmas which he never examined." The celebrated Bullion Committee turned out nearly as badly as Aristotle and the Schoolmen. One of their main propositions was "purely imaginary" and "an absurdity on its face," and the report itself has been "one of the most formidable obstacles to the progress of monetary science." Ricardo, if possible, outdid all his predecessors in stupidity, even Smith, for "no sooner did he take up his pen to write on monetary topics than he seemed instantly discharged of all reasoning faculty. In the same sentence he could affirm propositions exactly opposed the one to the other without the least perception of their incongruity"; and by way of illustrating the mental condition of the Economists, Mr. Poor mentions that this unhappy person "occupies the front rank amongst them as an original and profound thinker." The leading witnesses before the Bullion Committee "made statements and drew conclusions as groundless as, and far less valuable than, the speculations of the alchemists." The state of Lord Overstone's mind while he was before the committee was "wild and incoherent," and he got the mind of the committee into the same condition. Mr. Goulburn, the then Chancellor of the Exchequer, uttered stuff "for which a schoolboy should be punished."

Another foolish person was Tooke, the author of the 'History of Prices,' "one of whose fallacies ought to have been palpable to the dullest comprehension," and who devoted the greater part of one thousand pages to proving certain propositions "still more absurd." As to J. R. McCulloch, his assumptions are "the dreams or vagaries of persons bereft of all sense in reference to the subjects to which they relate, and who unfortunately are wholly impervious to reason." For him and the other Scotch economists Mr. Poor feels mingled pity and contempt. Not one of them, "although among the most distinguished of their race, can conduct an argument on money through a single paragraph without involving themselves in the grossest mistakes and contradictions." To what, he not unnaturally asks, is "this apparent feebleness of intellect due"? The answer is, "to the uniformity in religion and dogma which has so long prevailed in their country."

As to John Stuart Mill, suffice it to say that he was "incapable of scientific enquiry," had "a puerile mind" and "an infirm temper." Macleod's writings on economical questions are "flippant and incoherent nonsense," to which "it will not be necessary to reply until Dr. Schliemann shall have dug up Dutch cheeses at Troas or Mycenæ, perfectly fresh and sweet." J. W. Gilbart wrote voluminously on money "without any comprehension of its nature and laws." Mr. Fawcett is all wrong, of course, but not such an egregious ass as Macleod and Bonamy Price. As to Stanley Jevons, he is so foolish, "inadequate, and unphilosophical" that he "does not call for comment"; but "there is a lower depth than even he has sounded, and that has been touched by Bonamy Price." Mr. Poor apologizes for quoting from Price's lectures, but says "it may do some good to show the incoherent buffoonery taught in the name of political economy in one of the first universities in Christendom." The American writers need only brief treatment, as they "simply repeat, without a particle of originality or independence," what they find in the books written on the other side of the water. Professor Bowen is perhaps the silliest of them, and is "feeble and garrulous." Sumner and Perry are disposed of with contemptuous brevity, and David A. Wells is accused of "flippant nonsense."

We had intended making some examination of the author's "Laws of Money," which is, as we have said, the excuse for this large and pretentious book, but, after the above citations, we feel sure our readers will excuse our not undertaking it. A writer whose mind is in the condition indicated by Mr. Poor's language is clearly not qualified for the discovery of any "laws" or the prosecution of any scientific enquiry. As he is evidently not a person with whom it is necessary to mince matters, however, we will say, after a careful reading of his exposition, that in our opinion he does not know the meaning of the terms "induction," or "deduction," or "dialectics"; that he has never been taught to reason at all; that he thinks himself "inductive" when he is floundering in the deepest *à priori* bogs; that he has apparently read far more than he can digest, and that he has produced, all things considered, the most foolish and discreditable book which has issued from the American press for many years; and we would warn foreign readers that there is nothing in the author's position at home to warrant or excuse his abusive and insolent treatment of any writer, ancient or modern.

Reminiscences and Anecdotes of Daniel Webster. By Peter Harvey. (Boston: Little, Brown & Co. 1877.)—We have been somewhat disappointed in reading this volume. From the intimate relations which existed between Mr. Harvey and Mr. Webster, and from the greatness of the latter's career, and the interest of the public questions with which he had to deal, and many of which he had to settle, we anticipated finding in his friend's recollections a valuable collection of anecdote and reminiscence. But it is only too evident after reading a very few pages of the book that the author was not equal to his task. The requisite love and admiration of his subject he possessed, but the equally necessary powers of criticism and judgment he had not. There is something pathetic in the fidelity of his friendship, something almost canine in his unintellectual and undiscriminating loyalty. But the picture he gives of Mr. Webster is, we have no hesitation in saying, neither accurate nor characteristic. Mr. Harvey's Webster is a strange character—a combination of the acute lawyer, the far-seeing statesman, and the steady-going farmer, living a frugal and abstemious life, enjoying a large income and extremely punctilious about money matters, yet with a heavy incubus of debt on his shoulders all his life long; a man with a keen sense of humor, yet whose jests are, when repeated by their admirer, flat and stale to the last degree; a paragon of virtue and intellect, and the most popular politician of his time, whose career culminated in failure. Mr. James Parton

published not many years ago, in the *North American Review*, a picture of Webster in very different colors. Mr. Parton's Webster was an able and ambitious man, destitute of principle, involved in debt through his want of self-control, having no more conscience about money than the *roués* of Sheridan's time, who sold his political soul for a mess of pottage, and finally went to precdained ruin in the due course of events.

Mr. Parton exaggerated his case as far in one direction as Mr. Harvey has done in the other. Mr. Webster had his virtues and his defects, and we do not think the time has yet come, even at a distance of twenty-five years from his death, for an altogether impartial estimate of them. Of one thing there can be no manner of doubt : he was a great advocate and publicist. He had the rare merit in a lawyer of being equally persuasive with judges and juries. His arguments on questions of constitutional and general law had a most profound and far-reaching effect in the development of the system of law dependent upon the written Constitution under which this country has reached its present growth. His diplomatic despatches are models. He lived in a time of great lawyers : Marshall, Kent, Story, Mason, Choate, Shaw, and Wirt are all distinguished names at the American bar, and it is with such names that Webster's must be compared, as in the case of all the great lawyers who have had an important share in the permanent settlement of principles, and not attained their reputation by mere ingenuity or learning. The chief characteristic of his mind was perfect clearness and sound judgment. His argument in the Dartmouth College case is founded on the simplest and most elementary principles of justice ; and the positions he assumed as Secretary of State on the right of search were, as Mr. Harvey says, such that when stated there seems to be no possible doubt about them. It is curious to find him in his discussion of it anticipating the case of the *Virginius*, which proved such a puzzle to so many lawyers of a later day. The right of search, as contended for by the English Government, in Mr. Webster's view had no existence, for the simple reason that a regularly documented American vessel, flying the American flag, was part of American territory, and search of her was merely an act of trespass. But if the vessel be flying the flag without right—as, for instance, in the case of a pirate—she is not an American vessel, and it is nothing to us whether she is searched or not searched. Had this rule been applied to the *Virginius* case at the outset, the absurd idea that we had been insulted by Spain would have been seen to be without foundation.

It is impossible to read even the poorest life of Webster at the present time without being struck with the fact that for such a man there would now be literally no place in public life, and that even at the bar the race of legal giants to which he belonged has almost died out. In a measure this is doubtless due to the fact that public work once done cannot be done over again. The Constitution has been interpreted and the Government established on a sure foundation once and for all. The enormous industrial development which set in about the time that Webster's generation had reached maturity, and which had no effect on the early development of their minds or characters, has produced a new race of lawyers and of public men ; lawyers who devote all their ability—of which the total amount available in the community is probably quite as great as it ever was—to service of the interests of great corporations, interests which generally require skilful advocacy and great ingenuity, but devotion to which does not tend to develop profound lawyers. Meanwhile influences whose operation is now so well understood as to excite little or no attention have weakened the judiciary till lawyers of the calibre of Marshall or Shaw will not go upon the bench, and public life has ceased to offer to men of elevated ambition and self-respect an attractive career. It is curious to speculate on what Webster would have been had he belonged to a later generation. Popular as he was during the greater part of his life in Massachusetts, he would not have had the requisite "magnetism" to succeed now. The popularity of that day was inspired partly by a feeling of reverence and awe both for intellectual greatness and social position which the rapid progress of demagogism since his death has almost totally destroyed. He had not the feelings or tastes which would allow him to associate with his intellectual or social inferiors on the terms of equality now exacted in politics. In law he would have been for the last twenty years on the unsuccessful side in all constitutional arguments. Were he alive now, with his intense ambition and love of success, we should not be surprised at finding him engaged in almost any form of prominent activity—except that in which he distinguished himself when living.

History of Guilford, Connecticut, from its first settlement in 1639. From the MSS. of Hon. Ralph D. Smith. (Albany : Joel Munsell. 1877.)—A little country town sixteen miles from New Haven, on Long Island Sound, settled by farmers from Kent and Surrey, Guilford appears to have had an utterly uneventful history. The land was honestly bought of the Indians, the last purchase being confirmed by Uncas, the famous Mohegan chief, in 1641. The settlers obtained a good wheat and corn-bearing soil, excellent quarries of trap and granite, the best oysters on the Sound, and the aboriginal shell-heaps, which supplied an abundance of artificial manure. Numerous attempts to give a manufacturing character to the place have failed, but some ships have been built, and there is a prosperous iron-foundry. The "mayne end" of the fathers of Guilford (the third settlement in the colony of New Haven) was to "uphold the ordinances of God in an explicit *Congregational church way* with most *purity, peace*, and *liberty* for the benefit both of ourselves and posteritics after us." They therefore excluded non-church-members from the government—the common Puritan polity, and not noteworthy here except that from Guilford and the adjoining town of Branford went those uncompromising come-outers who saw in the union of the Connecticut and New Haven colonies an abandonment of the polity, and who, in founding Newark, New Jersey, made a last vain effort for "the carrying on of spiritual concernments, as also of civil and town affairs, according to God and a godly government." In the mere spirit of adventure, too, Guilford proved an actively swarming hive, sending colonists to all parts of Connecticut, to Berkshire County, Mass., to Guilford (Windham County) and Chittenden County, Vt., to Charlemont and Charleston, N. H., to Greenville, N. Y., etc. Most important of all, Francis Austin, of Guilford, is the reputed ancestor of the notorious Stephen F. Austin, the founder of the present State of Texas.

Schools were established as soon as the church was ; a library in 1737; the first newspaper in March, 1877. The great literary lights of the town were Dr. Samuel Johnson, the first president of King's (now Columbia) College and father of William Samuel, a later president of the same institution ; and Fitz-Greene Halleck, whose descent through his mother from John Eliot is perhaps as deserving of mention as that other fact, that he "was the first American poet to whom was awarded the honor of a bronze statue in a public place"—and such a statue ! Abraham Baldwin, member of the Federal Constitutional Convention and subsequent U. S. Senator ; Thomas Chittenden, first governor of Vermont ; and S. B. Chittenden, the present Representative in Congress, are the chief of Guilford's politicians and statesmen. The town is thought to have the oldest dwelling-house now standing in the United States, dating from 1639, though this pretension will be disputed : the Cradock house in Medford, Mass., is assigned to 1634. Longevity is predicated of the people also. In the early days the town was its own physician, purchasing its medicines out of the common funds, and unanimously voting "yea" in special town-meeting on the question "whether the inhabitants would buy Mrs. Cosster's Physic and Physical drugs." Lawyers have only lately obtained a foothold in Guilford, which boasts that none of its inhabitants was ever hung.

The late Judge Smith left a genealogy of the principal Guilford families, and several works of a like nature, which certainly ought to be published. The profits from the sale of the present volume inure to the benefit of the "United Workers for Public Improvement," an admirable organization of ladies for the purpose of beautifying the town.

Who and What. A Compendium of General Information. Compiled by Annah De Pui Miller. (Philadelphia : J. B. Lippincott & Co. 1878.)—Mrs. Miller's compendium of general information has been compiled on no other principle than that of recording the answers to the various questions that came up in her desultory reading. The editor found the book of value to herself and to her friends, and certainly it contains a good deal of miscellaneous information. The reader can learn who was called "The Bard of Avon," what poem was composed amid the noise of hammers, what century was the age of thought, what great men died of the gout, what great man had epileptic fits ; in short, the questions seem to regard nothing as too important and nothing as too trivial for enquiry. The answers, however, are much less thorough ; in fact, errors are inexcusably frequent. For instance, on page 76, it is stated that Cervantes was born in 1549, and at the end of the paragraph we are told "he saw the light of day just three years before Shakspeare," who was born in 1564, while the true date of Cervantes's birth is 1547. On p. 62 is the question "Who wrote 'Arcadia'?" to which the strange answer is given, "Joseph Addison"; on p. 320, however, the book is ascribed to its author, Sir Philip Sidney. P. 266, Horace Walpole is called the wit and beau of the time of Madame Récamier, this lady being confounded with Madame du

Defiand. P. 277 contains the statement that Dr. Johnson was paid one thousand pounds for his 'Rasselas'; what he really received was one-tenth of that amount, with twenty-five pounds additional when the book reached a second edition. We are also treated with some singular criticism of Dr. Johnson; it is stated that "he was a great bore at times, and so very unprepossessing in appearance as to be frequently shunned, till by his perseverance he made people like him. . . . Notwithstanding these many drawbacks he was worshipped by Boswell, who proved himself a friend when all others deserted him." Elsewhere we are told that after reading Boswell's 'Life of Johnson' "one feels . . . that it might have been better for Johnson had his friend Boswell never been born." It is curious, too, to read about Tennyson that a "great deal that he has written is misty, obscure, and enigmatical," and that his longer poems "must be read and re-read to gather their meaning, and even then one is not always sure that he has the right one." Robert Browning is mentioned as "a poet of no mean pretensions," a rewriting of the verdict given in Cleveland's 'Handbook of English Literature,' where, in a biographical sketch of Mrs. Browning, she is said to have married "Robert Browning, himself no mean poet." In the few lines on Keats it is said that the famous article on "Endymion" in the *Quarterly Review* was written by John Wilson Croker, but it is generally ascribed to Gifford; and then we find currency given to the grossly exaggerated statement of its effect upon Keats's life. The Madame Hanska whom Balzac married was a Russian and not a Polish lady, and Balzac married her in Russia and not in Poland, as is stated on p. 59. It seems hasty to assert, as is done on p. 396, that the thirteenth century "laid the foundation or root of all art," and that the next century was "the age of thought" because "then lived Dante and Giotto." The statement on the next page that Dante and Petrarch were great friends is without foundation, for Dante died when Petrarch was but seventeen years old. One can only smile at the assertion, on p. 379, that the Babylonians were the people who first instituted the custom of sacrificing human victims to conciliate their gods. By a florin is not meant necessarily "an ancient gold coin of Edward III., of six shillings sterling value"; there are also modern coins of that name in Germany, Spain, Holland, and England. As used on p. 232, it would seem that it is the florin of South Germany which is meant, and this is equal to forty cents of our money. P. 13, the familiar line from Pope is misquoted; it should read:

"I lisp'd in numbers, *for* the numbers came."

Omniscience is not to be expected in the writer of a book like this, but there is no excuse for ignorance of the best authorities.

HENRY HOLT & CO., NEW YORK.

Mr. Snider's work on Shakspeare has received the unqualified approval of the press East and West. Competent critics, who are accustomed to weigh their words, have spoken of its merits in the highest terms. It is pronounced one of the greatest works of literary criticism that has been written. It certainly is a work of literary criticism in a new vein, the first fruits of a comparatively new school of thought, which is destined to leave its impress upon the time.

The Whole Creation in Pain.

HENRY WARD BEECHER'S Sermon on "THE WHOLE CREATION IN PAIN" will appear in the *Christian Union* of January 30. No. 27 Park Place, New York City.

Democracy in Europe.

A History. By Sir THOMAS ERSKINE MAY, K.C.B., D.C.L., author of the 'Constitutional History of England.' Two vols. 8vo, 500 pages, cloth extra, gilt tops, $5.

From Author's Preface.

"If any profession of political faith is expected, as a pledge of the spirit in which this history is written, it is this: I hail the development of popular power as an essential condition of the social advancement of nations; I am an ardent admirer of political liberty—of rational and enlightened liberty, such as most Englishmen approve; and I condemn any violation of its principles, whether by a despotic king or by an ill-ordered republic."

By Joseph Cook. With Preludes on Current Events. 12mo, $1 50.

☞ 13TH EDITION.

BIOLOGY.

BY JOSEPH COOK. $1 50.

☞ 10TH EDITION.

TRANSCENDENTALISM.

BY JOSEPH COOK. $1 50.

"For searching philosophical analysis; for keen and merciless logic; for dogmatic assertion of eternal truth in the august name of science, such as thrills the soul to its foundations; for widely diversified and most apt illustrations drawn from a wide field of reading and observation; for true poetic feeling; for pathos, without any mixture of sentimentality; for candor; for moral elevation; and for noble loyalty to those great Christian verities which the author affirms and vindicates—these wonderful lectures stand forth alone amidst the contemporary literature of the class to which they belong."—*London Quarterly Review.*

RELIGION IN CHINA.

Containing a Brief Account of the Three Religions of the Chinese; with Observations on the Prospects of Christian Conversion amongst that People. By Joseph Edkins, D.D. Volume X. of English and Foreign Philosophical Library. 1 vol. crown 8vo, $2 50.

A work of positive and permanent value, by a writer who has enjoyed peculiar facilities for becoming acquainted with the religions, history, and character of the Chinese.

*** For sale at all Bookstores. Sent, post-paid, on receipt of price, by the Publishers,

JAMES R. OSGOOD & CO., BOSTON.

A BOOK FOR THE TIMES.

Heaven and Hell.

Those in search of information about HELL should procure a copy of

HEAVEN AND ITS WONDERS;
AND
HELL,
FROM THINGS HEARD AND SEEN.
By EMANUEL SWEDENBORG.

12mo, 453 pp., cloth, $1 50.

Of this important work by the great Swedish seer, over 13,000 copies have been called for during the past few years.

☞ For sale by all booksellers, or will be sent by mail, post-paid, upon receipt of the price, by

J. B. LIPPINCOTT & CO., Publishers,
715 and 717 Market Street, Philadelphia.

SILVER

Plated Ware.

THE

Meriden Britannia Company,

46 EAST FOURTEENTH STREET

(UNION SQUARE)

AND

550 BROADWAY, NEW YORK,

Are Manufacturing and have on Exhibition a Choice Selection of Desirable Articles especially appropriate for Gifts.

CENTENNIAL MEDALS AND DIPLOMAS were awarded to this Company for "SUPERIOR" SILVER-PLATED WARE.

MICROSCOPES.

Spectacles, Spy-Glasses, Opera-Glasses, Microscopes, Telescopes, Stereoscopes, Barometers, Thermometers, Magic Lanterns, Drawing Instruments and Materials.

Price and Illustrated Catalogues as follows will be mailed to any address:

Part 1, Mathematical Instruments ..... 158 pages.
Part 2, Optical Instruments..... 117 pages.

JAMES W. QUEEN & CO.,

No. 924 Chestnut Street, Philadelphia.

MICROSCOPES.

R. & J. BECK, Manufacturing Opticians, 921 Chestnut St., Philadelphia,

Invite your special attention to their unequalled stock of Microscopes, Telescopes, Opera Glasses, Spectacles, Eye Glasses, and Thermometers, at greatly reduced prices. Illustrated Catalogue mailed to any address.

Pratt's Astral Oil.

PERFECTLY SAFE.

Especially adapted for use in the St. Germain Student Lamp.

CHAS. PRATT & CO.,

Box 3050. NEW YORK.

Letter from Sir Henry Halford, Captain of British Team.

GARDEN CITY HOTEL, CREEDMOOR, Sept. 17, 1877.

Messrs. WM. S. KIMBALL & Co., Rochester, N. Y.:

GENTLEMEN: Pray accept my best thanks for the package of Vanity Fair Tobacco which I found here yesterday. It is the best tobacco I ever smoked, and will be a great source of enjoyment to me on my Western trip.

Believe me, yours truly, H. S. J. HALFORD.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 7, 1878.

The Week.

SILVER is already so plentiful that it is becoming a heavy burden to rich and poor. A good many of the larger employers, especially in the West, have taken to paying the wages of the work-people in it, thus illustrating afresh the old and well-known rule that when currency begins to depreciate, the laborer is the first to feel the effects of it; or, in other words, that when there is any "cheap money" afloat the poor man, to his cost and sorrow, gets more of it than any one else. Now it begins to afflict the storekeepers and the banks, and there promises to be a rising against it. Some dealers have already begun to protect themselves against it by refusing to receive more than ten dollars of it in a single payment. Others, who deal in the necessaries of life on a close margin of profit, are putting up their prices, and, as in the old days of fluctuating gold, the money-brokers are the only persons whom the confusion is helping. A meeting of the Board of Trade, called by three hundred leading firms, was held on Monday to take these facts into consideration, and a memorial to Congress was adopted describing the situation, and asking that sapient body to consider what it will be if the Bland Bill is passed. Resolutions were also passed recommending the associated banks of this city, in case the Bland Bill passes, to "take measures, as a protection to themselves and the community, to consider gold values as the standard or par, and quote all other values at a discount or premium thereon as the case may be, thereby making gold coin the monetary standard of value throughout the community."

We may add that the phenomena which we are now witnessing, or about to witness, here, were to be witnessed in Canada after the subsidiary silver had been driven out of the United States by the greenbacks. Most of it went over the border, and the Canadian tills and safes became so glutted with it that the dealers had to protect themselves as ours are now doing. That is, when you went into a store in Montreal or Quebec and asked the price of an article, you were asked what you were going to pay in—if in silver, the price was so much; if in gold or bank-bills, so much. As the silver had to be got rid of by selling it to brokers at a discount, this discount at least had to be added to the price. This state of facts is puzzling the local silver-men a good deal, and a majority of them have reflected so little on the subject that the most familiar and most easily predicted occurrences of the market take them by surprise. Some of them say that "silver happens to be plentiful about here (the great money centre of the Union) just now," and that the glut is due to "the refusal of the Government to accept its own coin," and offer other nursery explanations which are neither worth repeating nor discussing. The struggle between them and the commercial community begins to remind one of the struggles the merchants in some of the South American States used to have to protect themselves against the savage gauchos of the pampas, who despised anybody who was not equal to one night's gallop, and did not mind what he said on any subject.

The glut of silver has made its appearance as far west as Minnesota, and the merchants are complaining of it all over the State. By way of cheering them up, the Cincinnati *Commercial* explains to them that it is all owing to the fact that "the machinery of the mint and of the whole Treasury Department is in the hands of persons unfriendly to silver"; that is, there is a coolness between them and silver. Feeling lonesome and friendless, accordingly, in Washington, silver wanders off to country stores and banks, and lodges in the tills and vaults, sad and sorrowful. Put kind hearts in charge of the mint and the Treasury, who would smile on silver and receive it, and it would stay in that neighborhood and not bother the merchant elsewhere. The cold and cynical "goldites" will probably deny that money circulates by love and friendship, but the lively Chicago and Cincinnati financiers know better. This suggests the question whether we ought not to have women in charge of the mint and the Treasury, and not women only, but mothers? In fact, does not one need to be a mother to know how to manage silver, and make it the affectionate and faithful currency which the *Commercial* says it is sure to become, if not harshly treated?

The chief incident in Congress during the week has been the report of the new tariff by the Committee on Ways and Means. Though no measure is more certain to undergo radical changes before enactment, we have endeavored in another column to give a fair idea of its complexion. The House had the day before voted against reducing the present tax on whiskey. On Monday an Ohio member, Mr. MacMahon, who it is needless to say is a Democrat, moved to suspend the rules in order to instruct the Committee on Ways and Means to report in hot haste an income tax. He was disturbed by the present condition of public distress, and thought it important that "the wealthy of the country should bear a fair proportion of the burdens of taxation." In spite of the geographical quarter from which this proposal emanated, the requisite two-thirds could not be obtained for it; but as the spirit of the mover was the same as that which actuates the inflationists, repudiationists, silver-men, and communists who now control the House of Representatives, it mustered 165 yeas to 88 nays. The South and West were almost solid in favor of it. On Wednesday week the Senate ratified a treaty with Samoa, which happily commits us to no protectorate or other form of responsibility for the islanders and does secure some commercial and naval advantages. The Bland Bill has been the steady occupation of the Senate, but to enumerate all the amendments which must be got out of the way before a vote can be taken on it would surely be a thankless task. On Monday Mr. Bayard took manly ground against it, and Mr. Beck, to the surprise of some of his colleagues, moved an amendment for the appreciation to the full value of the silver dollar of the halves, quarters, and dimes. He took occasion to manifest his sympathy with Mr. Matthews's indifference to "abroad" by saying that "he did not want any foreign Government, or the citizens of any foreign Government, to have dealings with our mints." But he did not indicate the way in which he would prevent the German Government from selling our mint its cast-off silver. On Tuesday, Mr. Eaton spoke against the bill, but proposed a silver dollar containing six more grains (440) than Senator Christiancy's. In both houses petitions were presented to the effect that the unexpended balance of the Chinese indemnity fund of 1856, which equitably does not belong to the United States, should be applied through a commission to the relief of the famine-stricken districts of Northern China.

Mr. Bayard, of Delaware, has again distinguished himself by an able speech in the Senate on the Silver Bill, which goes over the ground very thoroughly, and which, with the recent speech of Mr. Edmunds, would make an excellent document for popular distribution. Mr. Bayard has rendered such good service on the currency question and in defence of the public credit that he now has all the outward marks of a Republican as depicted in Republican newspapers, and the only reason he is not acknowledged to be one is that he holds certain opinions on questions and events now purely historical. But the line of demarcation between such men as he and that small portion of the Republican party which remains true to Republican traditions, cannot last very much longer with safety. The longer the silver agitation lasts the more clearly it appears that it is but part of a communistic movement directed against all accumulated property, and against the influence of skill, experience, and training

in public affairs. The income-tax bill is but a branch of the same undertaking, and the mischief and danger of it lie not so much in the objects it now aims at as in the spirit in which it is prosecuted, the barbaric hostility to civilization it exhibits, and the contempt for all the great traditions of American politics. To resist it the best men of all parties must unite, whatever be their opinions about the bygone and the irreversible.

The trial of Anderson, of the Louisiana Returning Board, continues at New Orleans; but it is difficult, owing to the meagreness of the reports of the evidence received by telegraph, to say whether the case made out against him is strong or not. The Democratic papers naturally declare it to be conclusive, and his conviction seems probable. Wells has surrendered. Instead of having come on to Washington, he had been concealed in the neighborhood of New Orleans, waiting, he says, for a new jury panel to be made up, and probably, too, for the result of his application to Judge Bradley for the removal of his case to the Federal courts. This Judge Bradley has refused, with the concurrence of the other judges of the Supreme Court, and for reasons which we hope will by and by work their way into the heads of the opponents of the President's "policy." He decides once more, as Chief-Justice Waite decided in South Carolina, that the Fourteenth Amendment only protects citizens against unjust State legislation, and not against the misconduct of State officers. Wells's allegation, therefore, that he could not have a fair trial under the State jury law was, in Judge Bradley's eyes, refuted by an examination of the law, which seemed unobjectionable, and he held that for any impropriety in the execution of the law the Federal courts supplied no remedy.

There are still reports afloat that Wells, and perhaps others of the Board, will "develop" if they do not receive "protection" from Washington; but how the protection could be given has not been explained, and the persons whom the "developments" would, it is said, affect are not alarmed. Governor Nicholls is said to be opposed to the prosecution, and many Northern papers call it a breach of faith to try these men for "political offences." It may be a breach of faith on somebody's part to try them; but we trust it will never be acknowledged by either lawyers or politicians that forgery and falsification are "political offences." They are criminal offences, whatever be the subject-matter with which they deal, whether the Presidential chair or $10. The impropriety of making custom-house officers of Wells and Anderson becomes plainer every day. Men who had so completely forfeited the confidence of the community, whether justly or unjustly, ought never to have been taken into Government employ. It appears on the trial that every one of the Returning Board clerks, some of them pattern rascals, was given a place in the custom-house also.

It was a striking but not surprising fact that such native Southerners as went into business with the carpet-baggers outdid their foreign allies in the depth and breadth of their corruption. The latest revelation on this subject touches Mr. M. C. Butler, noted for his connection with the Hamburg massacre and recently elected United States Senator from South Carolina. He seems, indeed, to be up to his neck in one of the worst jobs of the carpet-baggers. In 1871 the carpet-bag bonded debt had already been contracted, and it was well known to be fraudulent as well as monstrous. A taxpayers' convention was held in 1871, composed chiefly of Conservatives, which we noticed at the time; it was of course an object for the carpet-baggers to obtain its endorsement for their debt. Accordingly Butler and one Gary, both influential members of the body, entered into a contract to get this endorsement, and to take their pay for it in the shape of ten per cent. of the profits to be made in a speculation in the bonds, which were expected to rise handsomely under the action of the convention. The speculation failed, because the bonds did not rise; the speculators were out of pocket, and Butler was called on for his contribution to make up the loss, which he refused on the ground that he was only to share in the profits, and he has been taken into court by his confederates, where the transaction has been exposed. It is a shameful story, in many ways far more shameful than the story of Cardoza, or Smalls, or even Patterson. The revelations of the Ring frauds made before the Legislative Committee at Columbia continue to leak out, and another damaging letter of Chamberlain's has been published. This gentleman, who was a member of the above Convention, and who was apparently made aware of the disgraceful contract, wrote to his "dear Kimpton" that he "would co-operate with Butler and Gary in every possible way."

The Comptroller-General of Georgia in his last official report gives the number of colored voters in the State as 84,164. They own 457,635 acres of land, valued on the tax-list at $1,244,000, and city property valued at $1,199,725. Their household goods are worth $486,522, and altogether, with their cattle and horses and implements and savings in bank, they are supposed to be worth over $5,000,000, which, for a purely laboring population just emerged from slavery and weighted in the race of life in all sorts of ways, is not a bad showing.

There has been a dispute raging for some time in the Legislature and the press over the disposition of the constitutional amendment on city government recommended by the late New York Municipal Commission. The last Legislature passed it *en bloc;* if this Legislature passes it, it will be submitted to the people at the next election. The Democrats, however, have opened up a fierce opposition to the section limiting the suffrage in the election of the Board of Finance, and the Republicans are, on a point of that kind, afraid to lag behind them. Even those who really do not disapprove of the restriction manage to oppose it under cover of a solemn conviction that it cannot be adopted. So it has been proposed either to submit the amendment without the suffrage section, or to break it up and submit the suffrage section separately. Such lawyers as Judge Comstock and Messrs. Peckham, Choate, and Robinson deny that this can be done, to which Mr. Bradford Prince, who advocates it, replies that it has been done in other cases; but it seems dangerous, nevertheless, to try it, and the safe thing would seem to be either its submission as it stands, or its separation by this Legislature and transmission to another in the separated form. Upon its value without the suffrage restriction there is a great deal taken for granted and very little said. This, which is the principal point, has not had nearly as much discussion expended on it as the improbability that the people would adopt the amendment as it stands.

In the financial markets the conclusion of the armistice had the effect of advancing British consols to 96¼; there was no effect on the money market here, although breadstuffs and provisions declined in price. At the close of the week, when the armistice seemed less likely to lead to peace, consols lost of the advance. United States bonds in London early in the week recovered part of the decline caused by the adoption of the Matthews resolution in the House, but later this was again lost and again partly recovered, the market for these securities varying with the tenor of advices from Washington respecting silver remonetization. At the New York Stock Exchange a duller week has not been known for years, and stock speculation was as nearly stagnant as it is possible for it to be with the Stock Exchange doors open. The reasons assigned for this stagnation are that the leading speculators are bewildered in the face of the uncertain news from Europe; of the news from Washington, where it is yet an open question whether the 412½-grain silver dollar will be authorized, and if it is, whether it will lead to inflation or contraction, or whether the effect will not be contraction first and inflation later; and, finally, of the condition of the railroad war, which has been patched up during the week by a settlement that may prove only a truce, to be followed by active war even before the opening of navigation a few weeks hence. United States bonds here have been weak. The 4 per cent. bonds, which are now offered for sale direct to the public, could throughout the week be bought for a less price at the Stock Exchange than the price at which the Treasury is, under the law, able to sell them. Silver in

London advanced to 54*d.* per oz., English standard, and the bullion in a 412½-grain silver dollar could not have been sold at the close of the week for more than 90½ cents gold, $0.9049. The gold value of the "paper dollar"—that is, the promise of the Treasury to pay one dollar—ranged between $0.9756 and $0.9815. In the city of New York there were 129 failures during January on liabilities of $7,113,039; the total assets available for the payment of these liabilities was only $1,433,839.

It was only on Thursday last that the armistice was actually signed, and the conditions which are to form the basis of the treaty of peace definitively announced. The long delay which caused so much excitement in England, and which was, there appears no reason to doubt, not understood even at St. Petersburg, was most probably due both to the unreadiness of the Turkish plenipotentiaries to accept their hard fate and to the desire of the Russians to get as far south as possible, and if possible close in the peninsula on which the capital stands, before stopping their march. The line of demarcation during the armistice has not yet been settled, but when hostilities ceased the Russians were across the railroad where it deflects to the east at Demotika, twenty-five miles south of Adrianople, and held it towards Constantinople down as far as Tchorlu, while their van had pressed down along the Maritza to Feredshik, within a few miles of the sea, on their right, and on their left had reached Rodosto, on the Sea of Marmora, to which point the cavalry had escorted a vast body of Mussulman fugitives—estimated at 50,000—after having disarmed the men. In fact, they may be said to hold the whole of Bulgaria and Rumelia, except the capital, and they had already shut in the garrisons of the Quadrilateral, and cut the line between Varna and Shumla, before the armistice was signed. The armistice provides for the evacuation of the five strongholds and Erzerum, and Erzerum is already in their hands, whether in pursuance of the agreement or through the exhaustion of the defenders does not yet appear. The Servians and Montenegrins, also, have been arrested in a victorious march—the Servians very reluctantly, but the Montenegrins, probably, gladly enough, "unconquered and weary of conquering." The Turk has now no hope but in the fears or generosity of the Powers.

The terms of peace are substantially those which we discussed last week as probable: the erection of Bulgaria into a principality —perhaps paying a round sum in tribute in lieu of taxes; a war-indemnity, either in money or territory; the independence of Montenegro, Servia, and Rumania, with an increase of territory for each; reforms (which probably means "local autonomy") in Bosnia and Herzegovina; an ulterior understanding between Turkey and Russia as to the Dardanelles, and the evacuation of Widdin, Rustchuk, Silistria, Shumla, and Varna. All these points are, however, to be debated and settled in a conference at Vienna which Austria has called, and at which at this writing all the Powers except Russia had agreed to appear, and she will doubtless do so at once. Austria seems to have grown restive under the delay in announcing the conditions, and, when announced, to have been troubled by the extent to which the proposed changes will touch her. She is reported to have mobilized one corps, and Russia, as if to keep herself formidable during the negotiation, is massing heavy reserves in Rumania. Austria has a keen interest in the reorganization of Bulgaria, Herzegovina, and Bosnia, and in the enlargement of Servia and Montenegro, which will probably throw her into close relations with England during the Conference. Turkey is to be represented, but it seems rather as a piece of courtesy than because her say will have any weight; in fact, the empire in Europe is gone, and the Eastern Question, after eighty years of postponement, has come up this time inevitably, Russia being thus far the only Power that has got any weight or credit out of it.

The Greeks, who, partly owing to English remonstrances, partly to their fear of the Turkish fleet, and partly to their poverty, kept out of the fray until it was plainly drawing to its end, threw off all restraint last week, crossed the frontier into Thessaly with 10,000 regulars and many volunteers, from Lamia, and, meeting with no opposition, marched straight on Dhomoko, the first town on their way, and stormed it, taking the garrison of 1,300 men prisoners with slight loss to themselves, and at the latest accounts were still advancing, and 7,000 men more were entering Epirus. They probably think that if they could take Larissa, they might claim the province before the Conference. The Turks have, however, sent their ironclads, under Hobart, to the Piræus, which has caused a panic at Athens, and there are fears that there may be a force landed up in the Gulf of Lamia, which would cut the Greek army off. Admiral Hobart's career in the Black Sea has been so inglorious that he is probably glad of an opportunity of attacking somebody, and the Greeks are an attractive enemy for a man in his plight. The excuse of the Greek Ministry is that they have entered Turkey to save Christians from massacre during the troubled period now approaching, which has some foundation in fact. The Turk, when things are going badly with him, usually looks about him to see whether there is not somebody whose throat he can cut without risk. It makes him feel more comfortable and softens his afflictions.

The debate in the House of Commons continues at this writing, the ministerial prospects on the whole improving, owing to the magnitude of the Russian demands, their vagueness, the delay there has been in communicating them, and the somewhat minatory air of the Czar's address to the troops at St. Petersburg on Saturday, when he said that "they were still far from the end," and must continue prepared until they had secured a solid and enduring peace. The conclusion of the armistice, too, and the calling of the Conference have diminished the Liberal fears of a sudden lapse into war, and other leaders in the House of Commons see and acknowledge the necessity of sending a British representative to Vienna with a united nation at his back. If, therefore, Mr. Forster's amendment is pushed to a division, which it may not be, the Ministry, it is thought, will get a majority of 100. But however the Eastern question may be settled, there is no question that it has in a measure passed out of English hands. A consciousness of the mistakes made on this point shows itself in Lord Derby's reply to a deputation of Greek residents in London, on Tuesday, when he read a despatch of his of 1877 showing that he had been the friend of the Greeks from the beginning, and would endeavor to protect their interest at the Conference, and, while not blaming them for invading Turkey, promised to try and settle this unfortunate affair. There are, in fact, many signs that the Ministry will now try a new rôle in the Levant.

The Turks, in the meantime, have been trying to prepare themselves for the Conference by another change of costume. The creation of the constitution and the parliament not having produced the desired effect on the European mind, the office of grand vizier, which has come down from the earliest days of the Caliphate, has been abolished, and a regular European ministry substituted for it, with its "portfolios" of War, Marine, Foreign Affairs, Commerce, and so on. The object of this evidently is to produce the impression that now that peace has been restored there is going to be more "reform" than ever, and that the little that remains to be done to make Turkey a modern state will be done right speedily. The new President of the Council, Ahmed Vefik Effendi, is one of the few genuinely civilized and cultivated Turks in existence, and his colleagues are mostly men of progressive views. Mahmoud Damad, the Sultan's brother-in-law, an ignorant Turk of the old school, whose influence has, with slight intermissions, been predominant at the Palace during the whole war, and has been vicious in every way, goes into retirement at last. He has many of the mental characteristics of an American silver-man—such as hostility to special training or experience and contempt for "abroad." We believe he can neither read nor write, and is, in fact, a "practical statesman."

"THE ART OF POLITICS."

THE failure or refusal of the President to bring any influence to bear in favor of or in opposition to particular legislation, such as the Silver Bill, for instance, is naturally exciting a good deal of comment, and most of it hostile. Most people, whether friends or enemies of the Administration, admit that the President is not confined either by the Constitution or expediency to the simple execution of the laws. He is directed to recommend legislation to Congress, and long and well-established usage allows him to employ whatever influence his position gives him to promote such legislation as he approves and oppose such as he disapproves. Unfortunately, the way in which the President has for many years exerted this influence is by offering a share in the patronage as a sort of bribe to the members of both Houses. This usage has existed so long that members of the party in power have got into the way of being indifferent to all legislation until they see what are the President's wishes about it. In other words, no matter how important it may be, or how plainly the Constitution has made it their concern, they give no heed to it until they hear from the White House whether they are to be rewarded for looking after it, and the reward, of course, consists in having their applications for offices properly recorded and attended to. It is in this way Presidents have influenced legislation for the last forty years. It was in this way Pierce, Buchanan, Lincoln, and Grant did it. It was in this way Johnson could have done it if he had not arrayed himself against a strong and even passionate public opinion on a leading question.

Mr. Hayes's refusal, in obedience to the party platform, to resort to this means of controlling and directing Congressional action, being a sudden and somewhat violent departure from a well-established custom, is accordingly producing a good deal of confusion in the political world. The Congressmen of his own party came to Washington ready "to support the Administration" in the usual way—that is, to vote as the Administration wishes on particular measures on being asked to do so, and on the assumption that compliance will be of service to them afterwards. Not receiving the expected intimation from the White House, they are accordingly surprised, angry, and demoralized. They exhibit great carelessness about the Silver Bill, for instance, and other attacks on the public credit. They do not resist them in debate or only resist them feebly. They do not defend the Administration when it is assailed, and, in fact, treat public business as if it was only in a very slight degree their business. When the newspaper correspondents ask them the meaning of their lukewarmness they reply that they are very willing to stand by the President and the party, but they must first know what he wants. That they have themselves duties and responsibilities as legislators, wholly independent of the President's plans and wishes, is an idea which, however prominent in the political system of the country, exists only very faintly in their minds. To all old politicians the spectacle is, therefore, a shocking one; to patriotic men of all classes it is, though for a different reason, more or less painful and disheartening. In fact, it is somewhat of an approach to the absence of all government. A country may have all the needed branches of a government, and yet if no one be responsible for the initiation and conduct of legislation, government, in the full sense of the term, can hardly be said to exist.

We ventured to point out some months ago the danger of the President's abandoning the old means of influencing Congress without providing himself with a new one, apropos of the silver movement, which had then begun to look threatening; that is, if he ceased to lead the party through the "spoils system," he would have, we maintained, to lead it through persuasive force and close contact with public opinion. Congress, as now composed, and especially the Republicans in Congress, are not ready to be let alone. They cannot as yet dispense with inspiration from the White House. The President cannot without mischief divest himself all of a sudden of the functions of a party leader; but no President can be a party leader under the new régime which the Cincinnati platform prescribes, and which public opinion longs for, who has not himself strong and definite convictions on the prominent questions of the day, and who is not supported by a united Cabinet who share those convictions. If Mr. Lincoln had had doubts whether it was better to carry on the struggle or not, or whether it would not be as well to compromise, and part of his Cabinet were in favor of peace, part in favor of war, and part in favor of a mixture of war and peace, he could not have made any impression on Congress or anybody else, even with the assistance of patronage. And yet the President is now in a position somewhat analogous to that here described. His own opinions on the silver movement are not, we take it, very clear or deep-seated or long held. The civil-service question, too, evidently still lies in his mind in a somewhat nebulous condition. He is not prepared to produce on either subject what the reporters call a "ringing" message, which would rouse the country and rally round him that large body of persons, both in and out of Congress, who instinctively follow a man who knows what he wants and makes it plain that he means to get it. The silver-men, or some body or class of persons, ought at this moment to dread his pen. There ought to be no speculation and no contradictory reports as to what he thinks and is going to do about a subject which is shaking American society to its centre, and on which the attention of the civilized world is fixed. His Cabinet, too, does not stand well together on anything. Two members care about civil-service reform, and three or four care about a stable standard of value; if the Administration was going to charge on either of the great questions of the hour, two at least would remain in their tents and look on. To be sure, in all this the Administration simply reflects the condition of the Republican party itself. But if we are going to dispense with the influence of office-jobbing, this state of things will not do; and yet it is a state of things which may be called the natural result of prolonged office-jobbing. The President, having been bred under the old system, probably did not foresee the new duties which the refusal to share his patronage with Congress would impose on him, and the increased need it would create for a united Cabinet with definite and pronounced ideas.

This is not the whole of the difficulty, however. Some of our papers—the New York *Tribune* for one—fancy that all the trouble is due to the fact that the President's advisers are "doctrinaire reformers," who have not learnt the "art of politics"—"one of the most delicate of the arts"—and the writer points to the way in which it is acquired in England as a contrast to the way in which some of "the counsellors" who surround Mr. Hayes have acquired it. He says:

"An Englishman goes into public life as he would go into one of the liberal professions, and before he reaches a high position in the Government he is expected to learn the art of politics in some inconspicuous place not beset with responsibilities too great for his strength. He has a pride in his career and a regard for its good repute. Naturally, therefore, he has made politics a highly honorable profession—honorable not only in its objects, but in its surroundings, in the social rank which it confers, and the associations and habits which attend it.

"But in the reaction against political corruption which has agitated the country during the past six or seven years we are in danger of committing a mischievous piece of extravagance. We must not forget that governing the United States is an art, and a very difficult art, and it cannot be learned in a week or two by smart lawyers, merchants, ministers, and authors, who have had no experience in the management of men and parties. The reformers of our day are too much inclined to consider it the highest recommendation of a candidate for a political post that he is 'no politician'; which is much as if they should undertake to correct the evil tendencies of the stage by insisting that all plays should be performed by men who are 'no actors.' It is not usual to value a doctor for his ignorance, or to select gentlemen who have never practised law for elevation to the bench, however highly they may be distinguished for general intelligence and personal virtue. But the principles of common sense which are so rigorously applied to the liberal professions are too often forgotten when we come to deal with affairs of state. The doctrinaire reformer believes that he can practise one of the most delicate of arts without having learned how, and that the right way to govern a political party is to put it under the care

of persons who have no practical knowledge of the mechanism of politics. This is pestilent nonsense."

These are valuable observations because the writer, though he accuses the wrong man, has discovered the *corpus delicti*. But the phrase "art of politics" does not bear the same meaning either in England, France, Germany, or any other civilized country which it bears in the United States to-day, and which the *Tribune* evidently gives it. The young politician in these countries learns "the mechanism of government" simply as a young military officer learns his drill—that is, as necessary, but only as the rudiments of the art. To him "politics" does not mean simply the art of getting and controlling votes, but the art of legislation—that is, of dealing with the leading problems of human society, finance, administration of justice, diplomacy, poor relief, education, and so on, *through laws*. He learns his trade through the study of "questions," and politics to him is "questions," not electioneering. Our politicians, on the other hand, occupy themselves with the "mechanism of government" solely. Accordingly, there is not a leading statesman in France, England, or Germany who would not at this moment be considered a simple-minded visionary, or doctrinaire, or ninny, and, in fact, be laughed at, in any assembly of American politicians, even though he had shown himself capable of giving great empires strength, liberty, security, and honor. One little fact will illustrate the difference better than whole pages of exposition. When the German Government proposed its scheme of recoinage and demonetization of silver, it printed its plan and distributed it among all the leading students of finance in the kingdom—the professors, bankers, and writers, and so on, and, if we remember rightly, left it a year in their hands, and solicited their comments on it, before attempting to legislate. In other words, it brought all the intelligence, experience, and learning of the nation to bear on the problem before touching it. Contrast this with the financial performances and equipment of Bland or Stanley Matthews, and we have the whole story in a nutshell. Who supposes that the able and skilful economists who have, during the last seven years, managed the public finances of France and the Bank of France, would carry any weight in certain quarters in this country if they were among the President's counsellors? And yet what matchless work they have done for the civilization of a great people!

The application of this to the situation at Washington is, we hope, obvious. If the President gets around him real politicians, that is, men who understand government as an art in which electioneering is merely a beginning, he inevitably cuts himself off, to a certain extent, from the sympathies of the other kind of politicians in whose hands the party management mostly lies. The members of a Cabinet so composed, however closely they might attend to their real duties, and however great their authority on all questions of legislation, would pass for "doctrinaires" and "visionaries," and be scoffed at and set upon, very much as Mr. Schurz is to-day; and yet no one can deny that the great end of all reform is to give such men their due influence in the transaction of our public business. But the remedy lies far beyond the reach of any President. It consists in the inculcation at school and college, and everywhere else where American boys and girls are trained, of greater respect for special knowledge, and greater faith in it, and greater willingness to be guided by it in the management of the national concerns. The notion that it is our amateur politicians who consider governing an easy art is a very queer error. It is the bulk of American voters who labor under this delusion, and it is this delusion more than any other which the next generation will have to fight, if we are to be saved from the ups and downs of republics further south.

SOME OBSERVATIONS ON THE PROPOSED NEW TARIFF.

MR. WOOD'S new tariff bill made its appearance last Thursday, and although the time since elapsed has been too short to allow a thorough comparison with the existing tariff to be made, our readers will be interested in the result of a cursory and partial examination of this important document. The introductory clause proposes to let the bill take effect January 1, 1879, thus unusually prolonging the period during which business must inevitably suffer from whatever changes may be enacted. As a commendable general feature of the bill we may point out that it proposes to do away with all complicated duties (specific and ad valorem combined), and to substitute therefor simple specific or ad-valorem rates, thus fulfilling the promise of effectual simplification. Before reviewing the different rates of duties proposed in Sec. 1 we will consider the general changes comprised in the sections following.

Sec. 2 substitutes for the present dutiable charges of packing inland freight, export duty, commission, etc., a general and uniform addition of five per cent. on the first cost of the goods, which in many cases, where ad-valorem duties are imposed, will amount to a reduction of duty, and in all such cases will relieve the importer as well as the appraiser from the difficulties hitherto frequently encountered on the score of charges.

Sec. 3 authorizes an unlimited use of bonded warehouses for the manufacture of bonded goods into articles of export. This privilege may prove of some value, but it will probably be applicable only to such articles as can be exported in large quantities.

Sec. 7 puts an intelligible construction on the amount of personal property which passengers arriving from foreign countries shall be allowed to bring in free, and does away with the vexatious question whether such property has been in use or not. The amount to be allowed to each passenger is wearing apparel to the extent of $200 in value, and other property to the extent of $500.

Sec. 14 in like manner defines more distinctly the privilege granted to States, municipal corporations, and to religious and scientific associations, of importing free of duty works of art and articles of a scientific or artistic nature.

Sec. 20 increases the duties enacted by ten per cent. on the amount of duty on importations from any country that discriminates in its own duties on imports by imposing higher rates upon imports from the United States than upon those from other countries. This clause appears to be rather loosely drawn, inasmuch as it is left doubtful whether such discrimination, practised by any foreign country, must be a discrimination against the United States and in favor of all other countries, or whether any discrimination in favor of one other country and against all the rest, the United States included, shall bring on the proposed retaliation. If the latter were the correct construction the effect would probably be that the additional ten per cent. would have to be imposed on our importations from nearly every country in Europe, since most of these countries have, by their special treaties made within the past twenty years, granted special advantages to the country with which any treaty was made. The case might thus occur that we should have to levy a discriminating duty upon all imports from a country that had granted to some other country a certain favor, though this favor may in no way affect the interest of the United States.

Sec. 21 proposes to enact the most radical of all the changes, inasmuch as it not only grants the free importation of all materials used in the construction, equipment, or repair of vessels of the United States, but also effects a total repeal of our navigation laws by offering the American flag and register to all vessels wholly owned by American citizens. Curiously enough, this sweeping change has attracted but little attention so far, and is passed over in silence by the explanatory notes appended to the bill.

Among the general enactments we miss a clause permitting goods lying in bond at the time the bill goes into effect to be entered for consumption at the reduced rates of duty. Unless this privilege does not require special enactment, the omission will result in great disturbance of trade.

Returning to the consideration of the rates of duty to be enacted by the first section of this bill, we have to say that a reliable estimate and comparison of the new duties on manufactures of cotton, wool, linen, and silk with the existing duties would, owing to the radical changes proposed in the manner of assessing such duties, require more study and more practical knowledge than we have as yet been able to bring to bear on this important subject.

We may, however, state our impression that the proposed rates of duty on dry goods generally would effect a moderate reduction of [illegible] but not sufficient to affect the present position the present duties, but not [illegible] of our own industries.

In Schedule B, treating of earth and earthenware, the most important change appears to be in the duty on plate-glass, of which the sizes imported in the largest quantities, particularly of silvered plate, are assessed at increased rates, which, it is said, will act in a great measure as prohibitory.

In Schedule C—hemp, jute, etc.—the proposed changes appear to effect more or less reduction of duties on the raw materials.

In Schedule D—liquors—the present uniform duty on still wine in casks of 40 cents per gallon and of $1 60 per dozen in bottles, which has favored the importation of the better qualities, is replaced by rates varying according to cost from 25 cents to $1 50 per gallon on wines in casks, and 100 per cent. ad valorem on wine in bottles, which will again discriminate in favor of inferior qualities.

Schedule E—metals.—Here the prominent feature seems to be a reduction of duty on pig-iron from $7 to $5 a ton, and a great simplification of the present tariff by rendering all steel, and most manufactures of iron and steel, subject to a duty of 35 per cent. ad valorem; the most important exception being steel rails, which are to pay 1 cent per pound, or about 64 per cent. on their present foreign value. The retention of the excessive duty of $1 50 per package on gold-leaf, and 75 cents on silver-leaf, will gratify the numerous smugglers who for years past have shown marked predilection for these articles.

Passing over Schedule F—provisions—where no remarkable change seems to be proposed, we come to Schedule G, treating of the important article of sugar, which, it is generally understood, has been fixed by the excellent member of the sub-committee from Louisiana. The result, as was to be expected, proves to be a general advance of the existing high duties and an increased discrimination against the higher grades, which mainly compete with New Orleans sugars. This proposed change will no doubt be widely discussed by our refiners. We will, therefore, leave its discussion to these experts, and merely draw attention to the clause which makes not only the color of sugars, but also their pulverization, a criterion for their classification for duty, which will prove, therefore, the reverse of simplification.

Of Schedules H, I, J, and K we merely observe that the existing high rates on spices, cigars, and tobacco, though simplified, appear to be fully maintained, while woods are favored with a considerable reduction.

Schedule L—wool and woollens—proposes to effect the greatest and most important reduction of duties contained in the bill by an abatement of about 33 per cent. on the existing high rates of duty on raw wool. The classifications of the present tariff are nominally retained, but the existing distinction between clothing and long combing wool is effectually abolished, and both classes, when unwashed, are made subject to a simple duty of 8 cents per pound on wool costing 32 cents and under, and of 10 cents on wool costing over 32 cents per pound. Why this useless distinction should be maintained and allowed to mar the undoubted improvement here proposed it is difficult to explain. The bill also maintains the existing discrimination in favor of English long wools (Class II.) which are allowed to come in *washed* at the single rate of duty, while washed clothing wool has to pay double the rate of unwashed. This discrimination, it is well understood among the trade, was introduced into the tariff of 1867 at the instigation of a prominent New England manufacturer, to whose special benefit it has inured, and who will rub his hands in the grave that now covers him if he learns that his heirs are to continue enjoying the benefit under a reformed tariff. The proposed reduction on fine wool, though less than what was expected and what was promised by the Morrison bill, will no doubt be thankfully accepted by our manufacturers. On carpet wools (Class III.) the proposed reduction of duty amounts to ½c. and 1c. per pound, according to first cost, the low-duty limit being maintained at 12 cents per pound, as at present.

We pass over Schedule M—sundries—with the remark that books are uniformly charged 20 per cent. ad valorem. This is an apparent reduction on the existing duty (25 per cent.), but it does [illegible] limitation of twenty years after publication, away with the prese[illegible] by virtue of which books of an earlier date are admitted duty free. On the one hand, therefore, libraries, collectors, and special students will be severely taxed, while on the other the custom-house officials, called upon to decide upon the value of books and pamphlets having often a fancy price, will not find their work simplified but perplexingly increased, since they will get no help from the importer.

Coming to the free list, we are first struck by the fact that the bill does not, as previous tariffs have, we believe, always done, specify the articles comprised in that lucky category, but simply enacts that "all merchandise not herein provided for shall be free of duty." We are thus consigned to the laborious task of carefully searching out the articles assessed by the existing tariff and not mentioned in this bill before we can knowingly rejoice in the extensive and valuable additions we have been promised, and which everybody seems to take for granted this bill actually proposed to make to the free list. We have not accomplished and scarcely attempted this difficult task, but we have gone far enough to make us entertain serious fears of disappointment for all those who have been expecting an effectual increase of that list. We have failed to discover more than one important article—viz., salt, which now yields an annual revenue of about $700,000—that this bill proposes to make free. The rest of the new free list seems to be composed mainly of minor articles, like honey, glue, burr-stones, ground emery, common soap, acids, acetates, and medicinal preparations, now yielding perhaps another $700,000, thus making the whole loss of revenue by these additions to the free list about $1,400,000. On the other hand, we find many important articles now free which this bill proposes to make dutiable. The following are the most prominent of these unlucky articles and the rates of duty it is proposed to impose upon them, viz.:

Raw silk	10 p. c. ad val.	Alizarine, garancine, and madder	20 p. c. ad val.
India-rubber	10 " "	Cochineal	10 " "
Crude argols	3 cts. per lb.	Indigo	10 " "
Cork bark	30 p. c. ad val.	Tin	10 " "
Cocoa	1 ct. per lb.	Peruvian bark	10 " "
Horsehair	30 p. c. ad val.	Gums of all kinds	10 " "
Hides and skins	10 " "	Camphor, crude	3 cts. p. lb.
Hide cuttings	10 " "	Seeds, other than linseed	20 p. c. ad val.
Rags for manu. of paper	10 " "		
Ivory	50 " "		

Here is a list of articles now free on which it is proposed to levy a revenue amounting, when calculated on the importations of last year, to about $6,000,000. Nearly the whole of this burden will fall first on our manufacturers, who, we are told, must be encouraged and enabled to send their products to foreign markets to compete with European manufactures. Instead of encouraging our export trade, this bill will actually reduce it. Within the past eight years, since hides have been free, our annual exports of hemlock leather to Europe have gradually increased to over a million of sides of the value of six millions. What sense is there in subjecting raw hides again to a duty of 10 per cent. and making no provision for any drawback on leather; or how can our calico-printers be expected to compete with Europe in foreign markets, when they had only just begun the attempt while their principal dyestuffs were free? Is it expected that these industries will, under the beneficent provisions of section 3 of this bill, be hereafter carried on in bonded warehouses? If revenue was the object to be reached by these reductions of the free list, why not rather tax coffee and tea, on which a duty of one cent and five cents per pound would produce as much as the whole of the above list of new duties, and of which tax even the poorest consumer would for ever remain unconscious?

We might point out some incongruities, evidently the result of oversight, where the raw material and the manufactured article are to be taxed alike, as, for instance, bark and quinine, cork bark and corks, ivory and manufactures of ivory; but enough has been stated to show the character of this bill. Clearly this new-fashioned mode of making a tariff in sub-committee and in secret has not fulfilled the expectations entertained of it, and unless this bill is effectually

amended in the direction above indicated the improvements embodied in it will be outweighed by its defects.

THE MIND AND MANNERS OF THE SILVER-MAN.

WE commend the subjoined extract from the Chicago *Tribune* to the attention of our correspondent, Mr. Mason, as an illustration of the way the discussion is carried on by the gentle Silver-man and his organs. Here is at least one sweet thinker to whom one may speak roughly when one catches him preaching a fraud, and inventing fables in support of it:

"The most insolent, most vituperative, the most truth-defying, and most extravagant and vulgar in denunciation of the people of the West, collectively and individually, was the New York *Nation*. It set itself up as a moral censor. It defined financial morality to be the prompt payment of raised checks; and because the people of the West, who discharge their debts from the proceeds of their own labor, decline to pay vastly more than they contracted to do, the *Nation* deluged them with abuse and defamation that would have rendered a fishwoman famous among her fellows, and has threatened them with the malicious lies of a blackmailer and a bully."

The reader will enjoy in this the way the honest fellow has changed his grievance and magnified it. What he has been complaining of until lately is his having lost his dear father's old silver dollar, which he had traded with since before he was born, by means of a most disgraceful and wonderful conspiracy, which was kept a dead secret by about 500 politicians and newspaper reporters, until they had accomplished their hellish design. His bereavement was none the less terrible for his not having been aware of it until two years after the blow fell. He says now, however, that what they really did to him was not steal his silver but "raise his checks," which he had doubtless drawn against gold to repay some Shylock a loan contracted at ruinous rates of interest to educate his younger brothers and sisters. We shall not be at all surprised if he turns up in a week or two with his clothes torn, a bullet-hole in his hat, and his face scratched, and declares that he was on his way to pay his debts with a wagon-load of "coin," drawn by an aged family horse left him by his sainted mother, when the "Money Power" fell on him in a lonely part of the road and took every cent he had. His condition, indeed, is rapidly becoming as forlorn as that of the poor Granger, of whom we heard so much three or four years ago. At first it was only by the railroads that that godly man was afflicted; but when he got time to examine himself closely, he found that almost every class in the community was armed against him and preying upon him. His principal enemy was, of course, the unspeakable villains who lent him money and took his note; then came the villains who carried him and his crops to market; then those who bought his corn and pork; and, finally, the grocers and dry-goods men and piano men, and in fact everybody who sold him anything. Lastly, he fell foul of the judges who sat on his disputes, and he used to foot up piteously the amount of land it took to maintain a judge. His sorrows grew every day, and he cursed and swore and wailed, and got his newspapers to curse and swear and wail with him, and pretend that if somebody did not hold him or pacify him he would bury himself and at least one branch of the human family in red ruin. After a while, finding that the world was getting tired of him, he began to laugh, and now pretends that it was all a joke, but a useful joke, for he says it frightened "the monopolists" and compelled them to carry him at the usual extortionate rates.

The sorry wag has now appeared as the Silver-man, and is threatening us with the same dissolution of the Social Bond with which he threatened us as a Granger. What is troubling him now is the "Money Power," which he never mentions without that wild look in his eye with which all those are familiar who have heard a Belleville orator denouncing "la Réaction." He was ranting about it in Washington the other day in the presence of a cold and bloodless "gold sharp," who, after listening a good while to his eloquence, asked him with brutal abruptness, "What is the Money Power, anyhow?" The strange light forsook his eyes on hearing this, and his jaw fell. After an awkward and reflective pause, he said, "Well, it's the darned fellows that won't buy your property at your own price." If there be one thing more than another which irritates him, it is opposition. He doesn't allow himself to be whistled down the wind by "the bookmen" and "the theorists." Anybody who differs from the people of his village he thinks a stuck-up jackanapes, and the experience of "abroad" in a matter of finance he listens to with the same sort of feeling with which he would listen to Sir John Lubbock's lectures on the manners and customs of the ants. He will not admit that anybody knows more on any subject than any one else. As American citizens, he says, living under equal laws, our knowledge is equal in quality and amount. It is only in monarchies that one man knows more than another. Here is a letter from an unfortunate who has to live with him in Illinois:

"JANUARY 31, 1878.

"I have read with great interest your article in last week's *Nation* on the silver craze in the South and West, and I stand ready to confirm all you have said of the West, so far as my own community is concerned. I can say, and say truthfully, that it requires almost as much courage to stand up against it in this community as it would have required thirty years ago to have stood up for the slave, and the man who does it runs nearly the same risk to his reputation and of incurring the odium of his neighbors. To prove to you the truth of this, I have on several instances of late endeavored to show up the iniquity and evils that would attend the passage of the Bland Bill—have done this in the post-office, stores, and shops of the village, any place where the subject might chance to come up; and it only took two or three such interviews to incur the name of 'bullionist,' and to show the feeling at once awakened by my defence of honest money. One of my neighbors asked me in great excitement: 'How is it that you know so much more than all the community? Are we all fools, and you know it all?' He added that so far as he knew I was the only man in the town who opposed the Bland Bill, and accused me of being 'the poor man's enemy.' And from faint sounds in the community I am confident that I am regarded, by certain ones in the place, as the friend of the bloated bondholder and the enemy of the poor. I have seen nothing like it since the old anti-slavery days, when my father stood almost alone, in a little town in New York, in his opposition to slavery. It is not true that I am alone in the town in defence of honest money, but it is so near it that all those who are with me might be counted on the fingers of a man's hand. Men who use some reason on other subjects seem to use none here—even members of my church, who are wont to give some heed to what I say on other matters.

"I write this simply that you may see how intense is the excitement over this matter in certain parts of the West, and how little, for the present, those who favor honest money in these parts can do to stay the tide.

"—— ——."

Nothing about him, however, is more curious and mysterious than his state of mind touching his beloved dollar. His fondness for it because it is "cheap"—that is, because it is a feeble dollar, which cannot purchase much or do much of the work of exchange—seems to indicate that he loves it as a mother loves a crippled child, because of its very helplessness and incapacity. But this theory is upset by the fact that he not only likes it cheap but small, for any proposal to enlarge it, such as Senator Christiancy's to raise it to 434 grains—that is, to make it a big, handsome dollar—fills him with fury, and makes him curse and call names. We begin to hear abuse of the Senator now in every Western breeze, thus showing that the maternal-instinct hypothesis must be abandoned. The same facts militate against the idea that he loves silver as the money of Scripture and as a great American mineral, for if he did so he would want to put as much of it as possible into his dollars in order to "pay his debts"—a process of which he is passionately fond—and in order to export it to the downtrodden nations of Europe. But he is utterly opposed to anything of the kind. His plan is to use as little silver as possible, a circumstance which has given rise in these parts to the odious suspicion that he is really a knave. This, of course, makes him very indignant, and he says that if anybody suggests this much oftener he will not even use silver to pay his debts. He will shield himself from these cruel insinuations by not paying them at all.

A FRENCH VIEW OF VICTOR EMMANUEL.

PARIS, January 11, 1878.

THE news of the death of the King of Italy will take the world by surprise. Who would ever have believed that he would die before the old Pope, whose death has been announced so often, and who continues to live by a sort of miracle? Only a few days ago we were informed that Victor Emmanuel had received Gambetta in Rome, at the Quirinal, and had had a long conversation with the chief of the Republican party of France. Even those who have not been the friends of the new Italian kingdom, even the Ultramontanes, will, I believe, be troubled by the disappearance of one who had become one of the familiar features of Europe. Victor Emmanuel had something in him which directly appeals to all the instincts of humanity; he was essentially a natural man, he had natural feelings; he was a visage, not a mask; he was real, his plain features were in harmony with a robust and almost rustic constitution. He had remained a true Savoyard, a man of the mountains; he preferred the free and cold air of the high altitudes to the perfumed breezes of the plains. Every year he hunted the chamois for a whole month in the Alps,

and during that time he lived in an immense tent not far from the glaciers.

No royal house has more traditions or a sterner etiquette than the House of Savoy. The reason of it is obvious : the Dukes of Savoy of old times were dwarfs who meant to become giants. They had a great force—they kept the keys of the Alps ; but they were constantly threatened by France on one side, on the other by the house of Austria and its numerous allies. They never were found at the end of a war on the same side on which they were at the beginning, except when they had had time to change sides twice. They were often accused of treachery ; they were simply taking precautions against the eternal foes of Italy. They were, unconsciously at first, the representatives of the great nationality which had lost its unity after the fall of the Roman Empire. Piedmont, the least Italian province of Italy, became the hidden heart of the new Italy. Nobody ever stopped at Turin ; who cared for its cold and stiff aristocracy, its small-capital court, fenced by more prejudices than the court of Louis XIV. ever had been ? There, however, almost at the foot of the Alps, lived princes and noblemen who alone thought of breaking the yoke of Austria and of regenerating Italy. I have known some of the men who were the friends of Charles Albert, the father of Victor Emmanuel. They were very different from the class of modern agitators ; they had not much in common with the men who are now in power in Rome. They were, so to speak, aristocratic Puritans. Collegno, one of Charles Albert's friends, who was obliged to leave Italy on the suspicion that he had entered into a conspiracy against Austria, made himself for years a professor of geology in France, and became minister to France in 1848. Cavour belonged to the same class, as well as Massimo d'Azeglio, as La Marmora, as the Marquis Alfieri. If you wish to have an exact idea of the Piedmontese world you must read Joseph de Maistre's correspondence.

Victor Emmanuel was educated with great severity, as is the tradition of the House of Savoy ; he saw only two classes of men—soldiers, who told him that a prince of Savoy is nothing if not a soldier ; noblemen, who whispered in his ear : "Italy must be made free ; she must be freed not by popular movements and agitations, she must be freed by you ; the new Italy must be the work, not of the revolution, but of the king." The young Prince grew up between these two influences ; but his principal teacher was his father, who instilled in him the instincts, traditions, and ambitions of his race. Charles Albert was only a cadet of the House of Savoy, of the Carignan branch. The last king of the eldest line was Charles Felix, who left no children. In 1821 Charles Albert entered into what may be called a conspiracy against the king, the exact history of which remains to be written. He was then in communion with the Carbonari, and encouraged their plans against Austria and the archdukes, who were the lieutenants of Austria in Italy. He was obliged to exile himself ; he took service in France and took part in the campaign made by the Bourbon government against the Liberals in Spain. He showed the hereditary courage of his race at the assault of the Trocadero, and, in order to recompense him, Louis XVIII. gave him the honorary title of "First Grenadier of France." Some of my friends remember having seen him at the receptions at the Tuileries in his French grenadier's uniform, with a blue coat and red epaulettes.

He was called to the throne of Piedmont at the death of Charles Felix, in 1831. He affected then the most reactionary views ; he took an active part in the attempt made by the Duchess of Berry against the government of Louis Philippe. What was his object ? Did he wish to gain time, to flatter Austria in order to deceive her better ? He surrounded himself with priests, with men of the old régime ; but there are good reasons for thinking that under this new mask the old Carbonaro still lived. Turin became for a while a hot-bed of reaction ; but the writers, the thinkers, the statesmen who were preparing the future of Italy found a sort of asylum in it. The seed which had been sown during long years of hypocrisy came out in 1848; the spirit of revolution was again unchained, and Charles Albert went to Novara. He refused the alliance of the French republic, which was offered him by General Cavaignac. "L'Italia farà da se" was the proud answer of one who never believed in anything but his own Piedmont and his faithful brigade of Savoy. We all know the rest, how Charles Albert resigned after Novara ; how Victor Emmanuel mounted his throne almost as a vassal of Austria. He had learned much from his father ; his rough and abrupt manners covered a profound dissimulation ; he determined to avenge his father, to avenge Piedmont, as soon as he could find his opportunity. He was helped in his plans by a great minister and by a powerful ally. It will be always to the credit of Victor Emmanuel that he recognized the rare qualities of Cavour, and was faithful to the Italian Richelieu. He paid his French ally with generosity ; for we must give this name to the abandonment of the province of Savoy, which was the cradle of his race and the nursery of his best soldiers. When we look back on the work which was performed by Victor Emmanuel and by Cavour we must acknowledge that it is one of the great political works of our age. A great nationality, which had nearly perished, has now revived ; Rome has become the capital of Italy, and Italy is not only united from the Alps to the Adriatic, as Napoleon III. said in his first proclamation to the Italians, but from the Alps to the most southern cape of Italy. Victor Emmanuel probably did not plan at first all that he was allowed to execute ; he ate his artichoke leaf by leaf. The capital wandered from Turin to Florence, and from Florence to Rome. He had to change his allies ; he acted first with France, and afterwards with Germany.

There are two things which will always be remembered of him : though France had done so much for him he never was ungrateful to France. He was obliged to protest against the convention of Rome, which had for a while shut Rome upon him and his Government ; he was obliged to enter into the German alliance, in order first to free Venice and afterwards to obtain Rome, but he never forgot Villafranca and Solferino. I believe that I am not mistaken in saying that at the time when France was so unmercifully punished for the sins of a government over which she had no control, Victor Emmanuel was the only sovereign in Europe, perhaps the only ruler in the world, who felt pity for her, and who understood that a fatal element of revenge and disorder had been introduced into Europe. He could do nothing for us—the sword of San Martino remained in the scabbard ; but he did not turn haughtily against us, and he did not say to us, like so many other nations, "Culpa tua tecum sit." We have also to give him very high praise for his rare perception of intellectual forces. He, the rude soldier, the man who enjoyed nothing but the sport of war, the sight of numberless battalions, the roar of artillery, understood plainly that there was a man as powerful, more powerful in many senses than the leaders of armies—the man of the Vatican, the head of the Catholic Church. He knew that his guns could not prevail against spiritual doors, that hearts and consciences cannot be taken by assault, that dogmas cannot be destroyed by laws. He did not conduct his *Kulturkampf* with any violence ; he became of necessity the adversary of the temporal power, and was very desirous not to make war against the spiritual power. The famous motto of Cavour, "Libera chiesa nel libero stato," inspired the law of Papal guarantees, which is extremely liberal in its character. It can be said, on the other hand, that the head of the Church never carried the war against Victor Emmanuel to the last extremities ; he scolded, he threatened, he did not do all he might have done. He preferred to remain in the Vatican even as a prisoner rather than to go to Malta or to France ; and I know, by many conversations with eminent Italians, that even while the Italian *Kulturkampf* was going on, there were always friendly and confidential communications between the Italian Pope and the Italian King.

Who would have thought a few weeks ago that Pio Nono would survive Victor Emmanuel ? Many fervent Catholics will see in this reversal of the ordinary rules of nature the action of Providence ; imaginative minds will also speculate on the curious coincidence of the dates of the death of the King of Italy and the anniversary of the death of Napoleon III. How rapidly the world is moving on ! Of all the men whose names are connected with the resurrection of Italy, how many are now left ? Cavour is gone ; Napoleon III. is no more ; Victor Emmanuel only survived La Marmora by a few days ; the statue of D'Azeglio is in one of the squares of Turin ; Ratazzi is gone. The old Pontiff who first gave a word of encouragement to Italy in 1848 still survives ; and though he has fought for years in favor of the temporal power of the Papacy, he has probably never felt any real aversion even for the men who deprived the Papacy of its earthly possessions. It cannot be that he has not in his own mind imagined some *modus vivendi* between the spiritual ruler of Catholicity and the armed ruler of Italy. Victor Emmanuel carefully acted so as to make such a *modus vivendi* possible, if not for the actual Pope, for the Pope who will come after Pio Nono. Time alone can show if his sagacity will be imitated by his successors, and if the revolutionists of Italy, who were rendered powerless by his exceptional and extraordinary services to Italy, will not after him shake with the last foundations of the Papacy the foundations of monarchy itself. The difficulties of Italy will now begin in earnest. The ties which held together Cavour, the King, Garibaldi, and even the Pope have been broken by the rude hand of death. Victor Emmanuel may have said on his death-bed, "*Exegi monumentum*" ; history will add or not, according to the wisdom or the folly of the new Italian generation, "*perennius ære.*"

Correspondence.

A GOOD STATE TO EMIGRATE FROM.

To the Editor of The Nation:

Sir: The contrast between the statements of the Kansas Board of Agriculture, as shown by the enclosed newspaper slip, and the recent remarks of Judge Dillon on the delinquent cities and counties of that State, deserves, in my judgment, to be noticed in a manner calculated to arouse public feeling against repudiation in every form:

"KANSAS.

"The monthly report of the Kansas State Board of Agriculture is filled with information of great interest to those who are interested in the development of the resources of the State. We give a few of the matters touched upon, as follows: Reports from fifty-eight counties indicate that the State is remarkably free from insect intruders, such as Hessian fly, chinch-bugs, etc. The farmers are generally holding their wheat crop for higher prices. About 80 per cent. of the corn crop is being held, largely for higher prices, although bad roads have kept back some. In the last monthly report the estimated area of wheat sown was given at 1,243,315 acres—an increase of 336,125 acres, or 45 per cent., over the previous year. It is now thought that the estimates were too low, and that the increase is much larger. The total pre-emptions of Government land during the year are 654,702 acres, and there are 6,845,298 acres yet to be taken. Population the past year has increased 23 per cent.; taxable property, 13 per cent.; State taxes, 1.16 per cent.; and the State debt, $1 91 per capita."

This boastful paragraph doubtless alludes to some of the very counties which are included in Judge Dillon's remarks. If so, these repudiators have the audacity to set forth the value of their lands as an encouragement to immigration when these lands have no doubt been made valuable by the use of the very funds for the payment of which they now refuse to make provision. I think it the duty of every public print in the country to warn emigrants not to locate among a people so false to their interest and duty and so tainted with this moral pestilence of repudiation. These remarks I trust will furnish occasion for an article which will be more effective than anything I can say. I have no desire for my name to be made public, but, having in years past suffered a loss of some ten or twelve thousand dollars from rascally repudiators, I am determined as far as it lies in my power to set my face against this damnable heresy.

Yours truly, G.

Boston, February 2, 1878.

STATE SUITS FOR STATE DEBTS.

To the Editor of The Nation:

Sir: Your article in No. 657 of the *Nation*, "Can States be made to pay their Debts?" opens an important enquiry into the undeveloped powers of the Federal Constitution. Looking at it from the highest States-right point, it would seem that such powers do exist. As between sovereign States, *inter gentes*, each has the right to go to war with another to make that State pay debts which she owes to the citizens of the first. But all gave up that right of war when they entered into the Union, agreeing to substitute for the *jus belli* the right to bring the repudiating State before a tribunal of international arbitration, the Supreme Court of the United States. The Eleventh Amendment in no way diminishes this right of one State to protect her own citizens by suing the State which denies him his rights, but only declares that a citizen shall not make war—*i.e.*, sue a State—but a State may. Therefore, when Iowa refuses to pay citizens of Massachusetts their just debts, Massachusetts cannot make reprisals, issue letters-of-marque, or declare war on Iowa, as she could do if both were sovereign States. But Massachusetts can call upon her citizens to place their claims in her hands for collection, and she can sue Iowa in the Supreme Court of the United States for the debt and can recover judgment. What process can be devised to execute the judgment of the court is to be wrought out of the "undeveloped powers"; but when the Constitution confers jurisdiction it grants no barren sceptre: all power necessary for the full and efficient exercise of it will be found when necessary. B. T. J.

Richmond, Va., February 1, 1878.

WESTERN MORALS AGAIN.

To the Editor of The Nation:

Sir: You have shown your willingness to print, in the *Nation* of January 24, the protest of one of the great number of Western men who believe in the single gold standard, and who find their attempts to make converts seriously hindered by the volleys of vituperation from the press of New York. You even admit that there is a great deal of force in what Mr. Mason says as to the uselessness of vituperation; but you ask, "Is it inexcusable on the part of the Eastern press?"

Permit me, as another one of that number of Western men, to say that it *is* inexcusable. When the heresies of inflation and of the need of "more money" obtained circulation "among the farmers and others who are very suspicious of money-changers and Congressmen," the Eastern press passed the subject almost without notice, or simply ridiculed its folly; but in times like these the great majority of men are far more inclined to lend their ear to men who assign *some* reasons for the shrinkage of values and the prostration of business, and who give them some hopes of a remedy. Demagogues knew but too well how to turn this to their advantage, gaining popularity by talking and writing continually about bloated bondholders, moneyed institutions, and corrupt Congressmen, until these demagogues themselves became our legislators, governors, and Congressmen; witness in this State of Missouri a Colman, Bogy, Bland, and others, too numerous to name.

The defeat of the inflationists in Ohio silenced them for a time, but also confirmed your Eastern men in merely ridiculing and denouncing the suffering people of the West. Is it to be wondered at that when the silver movement began—prompted by the great mining interests of the Western country—all the inflationists again supported it? Not from dishonesty, but from errors of judgment, which demagogues did everything to spread and to strengthen, but which the Eastern press did nothing to correct, except "calling names."

You say: "The charge that the demonetization of silver had been brought about by a conspiracy of bondholders and speculators" was opened by the West, and that it was difficult for the natural man to be polite to adversaries who went on degrading their country by the account of the credulity and corruption of Congress, when the facts disproving this charge could have been easily obtained by simply consulting the *Congressional Record*. The charge emanated from Congress itself. Senator Jones, of Nevada, in his speech delivered April 24, 1876, and sent broadcast over this country, opened with the assertion that it was "a wrong committed, no doubt unwittingly *yet no less certainly*, in the interest of a few plutocrats in England and in Germany," and that the undoing of that wrong "must be as open as the doing was indirect and implied." There, in Congress, the charge was made, and it has not been refuted or contradicted then and there, as it should have been, and not until the *Nation* produced the facts, almost two years later! Is it not natural that the false charge, so long and often repeated, uncontradicted, stuck well?

I fully agree with Mr. Mason that facts and arguments are wanted, and that the argument of expediency will be more effective than that of morality. It is difficult for most men to comprehend and believe that it would be immoral to pay in silver, recognized as money from time immemorial; they have learned in school that Congress has the power "to regulate the value thereof"—the Constitution of the United States says so; and did not nearly all our national economists teach that gold and silver are the best money and *immutable in value?* It will take a long time before even statesmen will understand that these were grave errors; that value is the relation of things in exchange with each other, constantly varying according to demand and supply, and, consequently, *constantly changing*, so that no immutable value or measure of values *can* exist—least of all can the relation of two things in exchange with each other and with other things be unalterably fixed. It will take a long time before legislators will fully understand that Government is and has ever been powerless to do more, in coining money and making it a legal tender, than to establish a denominator, whose purchasing power, however, is beyond Government control. And whilst I hold that a bi-metallic system could be established, consisting in coins simply denoting the weight of pure metal they contain (as "one ounce pure silver," "one pennyweight gold," or, under the metric system, one, two, three decagrams, etc.), making only a small charge for coinage, leaving their exchange value to the immutable laws of exchange—"demand and supply"—I have no hope that Congress will now adopt any such reforms. But the silver-men and the gold-men are too befogged in their prejudices on this question.

It is much easier to understand that, even if the silver dollar were remonetized, exactly as it was before 1873, and the Government would make it a legal tender for all debts, public or private, without limit, every dollar which we, *the people*, owe for goods imported, or otherwise, to the people of foreign countries, and every pound of tea, coffee, sugar

and other goods which we may hereafter import from England, France, or Germany, will have to be paid in *gold only*. We do not owe dollars, but pounds and shillings, or francs, or thalers, *gold*; on the other hand, what foreign countries buy from us, our flour, bacon, cotton, and *all* products which we export, will be paid to us in dollars, *silver*. On which side will then be the advantage of the cheaper money? The amount of money which we pay annually for our imports exceeds one thousand million dollars; the amount we receive for our exports amounts to another thousand million dollars, whilst the amount of interest which the Government pays on its indebtedness is but one hundred million dollars, and of this a large portion to its own people!

Let our laborers and our farmers understand that they would receive their wages and pay for the products of their labor in the depreciated silver, and would have to pay for their coffee and sugar and a thousand other things at gold prices, and Western men will sooner understand and believe you than when you taunt them for being debtors, and insult them by saying "Western morals are in a bad way." If Western morals are in a bad way, the Eastern press has done little to correct them, and Eastern Credit-Mobiliers, municipal and other rings, bankrupt life-insurance companies and merchant princes settling at 25 cts. on the dollar, have set the bad example.

Yours, etc., ISIDOR BUSH.

ST. LOUIS, MO., January 21, 1878.

[What was the Western press doing when Senator Jones told this story? Had the Chicago and Cincinnati and St. Louis papers no duty with regard to it?—ED. NATION.]

THE INDEBTED FARMER'S PROFIT IN SILVER.

TO THE EDITOR OF THE NATION:

SIR: The case of the indebted farmer may be put into figures as follows. Suppose that he raises 10,000 bushels of wheat, worth $1 gold, on his farm, and owes $1,000:

His crop will bring	$10,000	gold.
Expenses, including living, say	9,000	"
He can pay the debt with surplus	$1,000	"

If he can sell his crop for $1.10 in silver, his crop will bring:

10,000 bushels, at $1.10	$11,000	
He still estimates expenses at	9,000	
Surplus	$2,000	silver.

which will pay his debt and leave him $1,000. Should we be flooded with silver from other countries, and silver decline further, he thinks he would make an additional gain.

The answer to this *prima-facie* case is to be found in the prices current of this country for the past thirteen years. We have been trying inflation, and can ascertain just how it worked. If our farmer makes a profit by depreciating the dollar, some one else at home loses it. Liverpool will pay no more, no matter what metal dollars and cents are made of. The farmer deals with three principal classes: the laborer, the storekeeper, and the banks—perhaps the savings-bank which lent him the money to buy and stock the farm. To these must go the whole proceeds of the crop until the debt is paid, and out of these he must get the advantage he hopes to make by forcing upon them silver, while he still sells his crop for gold, or its equivalent.

Now, this expected profit all hangs upon one thing: Can the farmer compel his laborer to take a silver dollar instead of a gold one, and the storekeeper, who sells him groceries, tools, and clothes, to accept silver in pay without raising his price? If he can accomplish this feat, he will make the gain, and those who advanced him labor, merchandise, and money will divide the loss. Looking back, however, to the period from 1865 to 1868, when gold was at a premium of from 30 to 40 per cent. above par, all articles of ordinary consumption were 40 to 60 per cent. higher than now. When gold dropped to 115 and 110, after 1870, merchandise declined more slowly, remaining 25 to 35 per cent higher than present, which are practically gold, prices. Those who watched the markets with care consider that, until the panic of 1873–74 shook prices down toward their present scale, retail prices in currency had ever since the war ranged from 15 to 20 per cent. higher than gold for most articles in common use—that is to say, if the gold price was $1, when gold was worth $1 30 in paper, the currency price of the article was $1 40 to $1 50.

It now becomes important for the farmer to figure this closely, for if prices in silver advance more than 10 per cent. he will lose money. He cannot get more than 10 per cent. premium for his wheat. The same thing that happened before would occur again for the same reason—if silver should prove equally fluctuating. The storekeeper, in fixing his prices, always added an extra margin to cover risk of fluctuation or further depreciation of currency. He could watch Liverpool at least as closely as the farmer, and, always knowing the prices of gold and silver, could tell just how much to pay for grain. The farmer possessed no such check on the prices of groceries, clothes, and tools, and the fluctuating currency always told against him, and always will.

The laborer can barely make both ends meet now. As soon as he finds prices in silver advance for all he buys, he will demand $1 10; and, if prices advance more than 10 per cent., he must have more than $1 10 where he now gets $1. If the farmer moves quickly, he may make something out of his laborers before they combine and get prices up, but he cannot hope to get ahead of the storekeeper.

Admitting that silver will be steadier than paper was, and keeping within the safest limits, should gold continue worth only 10 per cent. more than silver, there is no reasonable doubt that prices of all staple commodities, not exported, will advance 15 per cent. above present prices, the extra 5 per cent. being the margin needed against fluctuation of currency. The farmer's case will compare with his present one as follows:

GOLD BASIS.

10,000 bushels at $1 gold	$10,000	
Expenses 90 per cent	9,000	
Surplus	$1,000	

SILVER BASIS.

10,000 bushels at $1 10	$11,000	silver.
Expenses, $9,000 + 15 per cent., or $1,350	10,350	
Surplus	$650	

Should the farmer be able to get any profit out of depreciation, it will be what he can take out of his hired man; and when the laborer gets his wages levelled up the farmer will be worse off than ever.

To sum up:

He may pay his creditor in silver with his surplus crop, and thus get something out of him; but on all his expenses the price of supplies will more than counterbalance this advantage.

The loss from depreciated currency would first fall upon the thirty millions of laborers in the country, who could only get wages raised by a series of struggles in which they would suffer before the advance was conceded.

The creditor would have to stand his share.

The farmer would feel his loss, as already shown, while the only men who in the long run could profit by the change are the middle-men, who protect themselves from fluctuations in currency by additional margins, and the broker and speculator, who trade upon rapid changes of value.

F.

BOSTON, February 3, 1878.

PROF. WALKER ON BI-METALLISM.

TO THE EDITOR OF THE NATION:

SIR: Prof. Walker, after quoting a passage translated from Hertzka, and published in the *Evening Post*, says: "The demonstration is complete; but I am not satisfied that Mr. Hertzka and his American translator are on equally firm ground when they argue that the extreme case of 1:1 affords a test of the bi-metallic theory, and that if it be found to fail here it would fail on any ratio assumed." And again: "When Hertzka's translator, after giving his demonstration of the impossibility of keeping gold and silver in concurrent circulation at a ratio far wide of the market ratio, say 1:1, draws the conclusion that 'In whatever degree the legally fixed ratio should differ from the market ratio, in that degree the results described would follow'; and again: 'All this holds true, according to its measure, of any other legal ratio than 1:1, if it were not the true ratio of the market,' he overlooks the important principle stated by Mr. Mill, that, in efforts towards certain ends, 'small means do not merely produce small effects: they produce no effects at all.'"

I do not remember the remark here attributed to Mr. Mill. The author says it was made in regard to "efforts towards certain ends." It certainly could not be true of any "means" other than artificial expedients. Artificial expedients, whether great or small, not only may not have proportionate effects, but they may have no effects, an observation which it seems that the bi-metallists ought to ponder, since it is they who propose

to employ "means" of that order. Hertzka and his translator, however, are discussing the operation of economic forces, not "efforts towards an end," or artificial expedients at all. It is as impossible to conceive of any force whatsoever which does not produce an exactly corresponding effect in economics as in physics. Artificial expedients may change the direction and incidence of the form of economic forces, but they cannot diminish their effects in the slightest degree. Hence, it follows that the law of action of any force in economics, when once determined, applies to all degrees of that force. Regarding this passage, therefore, from the interest of financial science, it demands a very earnest protest. The unwary reader is likely to go away with the impression that he has seen a strong and clever point turned against the enemies of bi-metallism, when, in fact, the author has let slip entirely the subject he was treating, and has insinuated the most mischievous confusion possible in financial science, that between the domain of artificial expedients and the domain of natural law.

Prof. Walker quotes from many writers for and against bi-metallism, but it may be doubted whether his readers will get any clear idea of the issue. The question in issue is not whether it would be expedient to use both metals at once or not. The mono-metallists are not those who *want* to use only one metal, and the bi-metallists those who want to use two, supposing that we had free choice. It is a scientific question as to whether it is *possible*, under the natural laws controlling the matter, for us to use two. Those who take the negative are called mono-metallists. The affirmative is divided into two schools. The first affirms that legislation can so limit the fluctuations in value of the metals that neither metal shall be permanently demonetized, but that the one out of use can be recovered, if occasion arises. This is the doctrine of Wolowski and the adherents of the alternate standard. The other school affirms that legislation can hold the two metals so closely to a fixed ratio of value (however closely that may be) that they *will* circulate together. This is bi-metallism, properly so called. These two propositions ought to be carefully discriminated, for they are of very different scientific value. As to the former, I assert that, if true, the legislation proposed would alter the incidence of the effects of changes in economic forces and would be an abuse of legislation. As to the second, which teaches that legislation can *control* natural forces for definite results, I hold that it is a heresy which an economist is bound to combat.

Prof. Walker nowhere discusses this issue, nor does he present it to his readers. He leaves them to infer that his discussion is adequate to the subject, and that, with an international coinage union, starting at the market ratio, a concurrent circulation would exist. It is unfortunate that when he comes to the climax of his discussion, where we are entitled to the most calm and severe presentation of the reasons for believing in the efficacy of the double legal tender to keep up a concurrent circulation, he should put us off with the illustration of the dog tied to the express train, and the man driving a pair of horses. He admits the force of Hertzka's demonstration, but does not tell within what limits that demonstration seems to him to yield to the action of the double legal tender. The dog story fills this important gap, and leaves the author in the position of teaching that the limitations on the action of an economic force are analogous to the limitations on a dog's power to run.

I will not take up your space to analyze this or the other illustration, to show their inappropriateness, or the mischievous fallacies which they suggest. It is enough to say that those who regard money as an organ in the industrial organism cannot admit any analogy between the power of legislation to interfere with the functions of money and the power of intelligence, strength, and machinery to control brute force. The author, applying his illustration, says that "the success of the [bi-metallic] experiment will probably depend upon the strength of the impulse to divergence, as compared with the strength of the carriage, of the harness, and of the driver's arm." I suppose it will not be denied that, whatever restraint the driver exerts over the horses, is won at the expense of the carriage, the harness, and the driver's arm, so that the illustration, if otherwise admissible, would only lead us up to the question: At the expense of what other parts of the industrial organism will any restraint exerted on the fluctuations in the value of the metals be won? The economic forces leading to a change in value can only be diverted by legislation; they exert their full effect somewhere. Formerly France secured the compensatory action by assuming the burden and the loss. Under the coinage union the loss on one metal would be transferred to the other, to the gain of bullion brokers and false coiners.

We come next to a paragraph in which there is an attempt to discuss the question of practical action of the double legal tender. In 1870 the average ratio was 1: 15.57; in 1871 it was 1: 15.58. It is asked whether if the ratio of 1: 15.57 had been adopted in 1870 by all civilized nations, it would not have counteracted the forces which produced the ratio of 1: 15.58 in 1871. The answer given is that it would, seeing that debtors would seize upon the depreciated metal and, by their demand, restore its value.

Let us first fill up the hypothesis. It must be assumed that in 1870 all civilized nations fixed upon the ratio of 1: 15.57, and supplied themselves with coin of both metals at that rate, say half the circulation of each metal. I cannot conceive of any such thing as practically realizable, but that is the hypothesis. Now, new supplies of the metal do not come into use in the requisite proportions all over the earth, but the sources of supply are local. Hence, the metals do not have the same ratio of value in the Atlantic and Pacific States, and if there were a gold-mine in New Haven and a silver-mine in New York there would not be the same ratio in those two cities. Suppose, then, that the silver-mines of the United States produce an extraordinary supply. If there were not a free mint this supply could not act on the value of the coin, and the supposition that there were not a free mint is the only condition on which the supposed extraordinary demand for silver could at once prevent a depreciation of silver coin. Thus, if there were not an open mint silver would not fall, and if there were not an open mint an increased demand would keep it from falling. Hence, it appears that the bi-metallists require another specification in their hypothesis—that, when the concurrent circulation, at a fixed ratio, has been provided, the mint be closed. In this form it will hardly be necessary to discuss the proposition with any one. Take, then, the case of an open mint, which, of course, is the only case contemplated. At the ratio of 1: 15.57 the dollar should be 23.22 grains fine gold or 361.5354 grains fine silver. The new supplies of silver would be taken to the mint and would increase the volume of the circulation. Silver would now fall, since, with the monetary system supposed, it would require only the lightest shade of preference to decide which metal to hold and which to give—*i.e.*, which to withdraw from a redundant circulation. A small force would exert a small effect, or would require a long time, by affecting only that small class of transactions which employ large amounts of coin. We think at once of exchange transactions and of the coin reserve of banks of issue. The fact that a light shade of difference would not lead all debtors, great and small, to demand silver, is just the reason why the "demand" on which the bi-metallists count would not have the magnitude or the effect they anticipate. If silver fell to 1: 15.58 the silver dollar ought to weigh 361.7676, or the coined dollar in use would be worth .641 of a mill less than the gold dollar. Such a difference would not affect all transactions, but it would amount to $64.10 on $100,000, and I think no one will deny that that difference would determine the choice of metal to use in large transactions. I have no hesitation in affirming that one-tenth of that difference, or a variation from 1: 15.57 to 1: 15.571 —*i. e.*, $6.41 on $100,000—would suffice, only in a longer time, to overthrow the balance of the monetary system supposed. So long as the new supply continued to be offered at the lightest shade of depreciation (and it would be so offered unless it happened to fall in with an increased requirement for money), the demand of those who could profit by it would simply draw it into the circulation, gold being given out to the same extent, and, instead of the depreciation of silver being counteracted, it would depend entirely on the amount of the new supply of silver whether the movement would stop when the proportion of silver in the concurrent circulation was raised from .5 to .51, or to .9, or to the whole; that is, the concurrent circulation would be destroyed in part or altogether.

It is a necessary assumption of the bi-metallists, although they have never discussed the point, that the metal exported under these circumstances would be silver, just as the domestic debtor would pay silver. This is certainly an error. Foreign debts are paid by bills, and American drawers would have to ship gold to draw against, if they wanted to keep their bills up to standard. Or, to put it otherwise, as prices rose here from the addition to the total circulation, and as gold was thrown out by the advantage from using silver, gold would be superfluous here and would lose value, as compared with its value elsewhere. Silver would be sent here from other "civilized countries," and the upshot of the experiment would be that we should use silver only, while the nations which have no silver-mines would use gold only. To sum up, then, the bi-metallic theory is reduced to this dilemma: If the concurrent circulation were not accurately established it could not be established at all, but the money would be in stable equilibrium, consisting of one metal only. On the other hand, the more accurately the bi-metallic theory was realized the

less stable, and not the more stable, would be the equilibrium of the metals in the coinage. The lightest turn in the ratio of value of the market would suffice to throw out either one metal or the other to a greater or less extent. To this result every scientific investigation of the question must come, enforcing the conclusion that a concurrent circulation, save when and while the legal and market ratios coincide, is a natural impossibility. Yours respectfully,

"HERTZKA'S TRANSLATOR."

NEW HAVEN, January 24, 1878.

Notes.

THE important announcement is made of the union of the two firms of H. O. Houghton & Co. and J. R. Osgood & Co. under the name of Houghton, Osgood & Co.——The president of the New Hampshire Antiquarian Society, Rev. Silas Ketchum, has undertaken to compile a 'Dictionary of New Hampshire Biography.' He desires minute information in regard to persons, living or dead, who deserve a place in such a work. His address is Poquonock, Hartford Co., Conn.——The last number (4) of vol. i. of the *Pennsylvania Magazine of History and Biography* is adorned with an illuminated title-page for the volume; a steel portrait of William Penn, at the age of twenty-two; and a map of the battle-field of Germantown, accompanied by a lucid account of the battle—perhaps, too, as authoritative as any we shall ever have.——The January number of the *Magazine of American History* gives a steel portrait and a sketch of the life of William Walton, who built the famous dwelling still bearing his name in Franklin Square a century and a quarter ago. It contains, besides, two very interesting articles on "The Fall of Alamo" and "The Portraiture of Washington"—the latter with special reference to the General's false teeth.——Prof. J. E. Todd, in the *American Naturalist* for February, discusses the distribution of timber in Southwestern Iowa, where there is great diversity of surface but substantial identity of soil, and concludes that Prof. J. D. Whitney's theory of too close a soil will not account for the treelessness of the prairies. "The fundamental condition of forest growth is a constant medium humidity of air and soil."——President Samuel H. Scudder's address before the Appalachian Mountain Club, published in the February *Appalachia*, is a remarkable résumé of the past year's explorations and surveys, State and national, in this country. It deserves a wide distribution among Congressmen and State legislators. ——By special arrangement with Trübner & Co., the *Library Journal* will print in two double numbers (January and February) the unabridged proceedings of the late International Conference of Librarians in London. No extra copies beyond the subscription list will be printed.——Bulletin No. 44 of the Boston Public Library continues the Check-list for American Local History as far as New York City.——An elaborate history of Middlesex Co., Mass., in preparation by Samuel Adams Drake, will be published in two volumes, for subscribers only, by Estes & Lauriat, Boston.——B. Westermann & Co. send us the first number of *L'Athenæum Belge*, published January 6, at Brussels. It is a tolerably close copy of its great namesake, but its meagre eight pages and fortnightly appearance give the enterprise an air of feebleness which we hope is only temporary. We learn from its advertisements that a 'Parliamentary History of Belgium, from 1831 to 1880,' by Louis Hymans, has begun to be issued in parts. It will make two solid volumes of 1,200 pages each.——Prof. Stanley Jevons is engaged on an abridgment of Adam Smith's 'Wealth of Nations,' to which he will add copious original notes for the use of students. Macmillan & Co. are to publish the work. ——George P. Rowell & Co. have converted their annual 'American Newspaper Directory' into a quarterly, beginning with the January issue, which is before us. It is characterized by the typographical neatness and accuracy, and evidence of conscientious labor, which distinguish the publications of this firm, and which savor (at least to the uninitiated) more of public spirit than of business calculation.

—The fifty-second annual report of the President of Harvard College has the usual claims upon the attention of the public interested in the higher education in this country. Already the section discussing the cost of a course at Harvard has been widely copied by the press, and certainly it was high time that some reliable estimate should be obtainable by would-be patrons of the college. In round numbers, $500 per annum is the minimum (food and clothing included), $600 is economical, $800 moderate, $1,300 ample, and there is no limit beyond this. The second estimate allows for the student's taking his meals in Memorial Hall, at a charge of $175. Moderate as this sum is, it appears that it could be materially diminished if some friend of the college would relieve the enterprise of the debt incurred in equipping the Hall and kitchens, which now amounts to $43,069 66. Mr. Quincy A. Shaw has set a good example in this direction. The benevolent millionaire, in fact, is reminded on every page of this report of the splendid opportunities of increasing the resources of the University. The Divinity School is straitened and needs about $50,000; the Dental School is sadly in want of an endowment; the Library building must make haste slowly, and money is needed for salaries and wages more than for books; $100,000 would enable the Observatory to catch up with the arrears of publication of its achievements. The Medical School is making money; and the Law School is in good financial condition, though expecting soon to be pinched for room. "The best forms of gift to the University are now these," says President Eliot on p. 41, to which we refer all testators. The Botanic Garden and Arboretum should not be overlooked. The latter is an establishment only five years old, yet it has been the cause of the planting during the past season, in the New England States alone, of nearly half a million trees. Before taking leave of this report, we must notice the protest of the Law School against the recent rules of the New York Court of Appeals. The Court itself will, we are sure, acknowledge the justice of it. The rules shorten the term of pupillage for admission to practise first in favor of college graduates, and next in favor of those who have studied in a *New York* law school—an invidious distinction, which, if imitated in other States, would take away the motive for existence of any law school of national scope.

—We commented a fortnight ago on the address of the *Christian Advocate* to its "non-renewing subscriber," in which it virtually promised everlasting salvation and the paper for one year on the receipt of $2 70; and as the editor is a prominent divine, we take it for granted he knew what he was saying. His offer has, however, called forth severe criticism from others besides ourselves, and last week he answered the fault-finders, and our readers will be entertained by hearing that the answer is simply that his method of pushing his circulation *pays;* that it has brought him in 18,000 subscribers "during the present canvass, which is yet far from being complete." With this, he says, "he is satisfied," and he insinuates that those who do not get subscriptions in this way, and object to it, are simply crying "sour grapes." His views on temperance appear also to have got him into trouble with the religious press, owing to his saying that (our readers will forgive our reproducing his remarks—there is no other way of dealing with such people), "if Christ made alcoholic wine he must be put on trial, not as a sot, but as a moderate drinker, who, according to the law of human nature, with so many million illustrations, was possibly saved from becoming an example for sots by being crucified in early manhood."

—We have received several letters enquiring the best method for calculating the gold value of the bullion in silver coins. The shortest and best way is, having found the price per ounce in New York of silver, to multiply that price by the number of ounces in $1,000 of the coins whose bullion value is sought, and thence derive the value of a dollar of these coins. In every thousand of trade-dollars there are 875 ounces of silver 900 fine; in every thousand 412½-grain dollars there are 859⅜ ounces, and in the subsidiary coins (halves, quarters, and dimes) of the face value of $1,000 there are 803¾ ounces of silver 900 fine. It follows, therefore, that if the price per ounce is multiplied by the number of ounces the gold value of the bullion in $1,000 of the coins given is ascertained. To illustrate, suppose that silver bullion 1,000 fine can be sold in New York for $1 15½ gold per ounce. As standard silver, the kind that the coins contain, is 900 fine, silver 900 fine would be worth $1.0395 per ounce; this price multiplied by 859⅜ will give the gold value of the bullion in a thousand 412½-grain dollars, which would be $893 31; one hundred dollars would be worth $89 33; and one dollar $0.8933. At the same price of silver the formula for the gold value of the bullion in a thousand trade-dollars would be $1.0395x875; and for the gold value of the bullion in subsidiary coins of the aggregate face value of $1,000, $1.0395x803¾. In the calculations that we have from time to time published we have taken as the New York equivalent of the London price the exact price at which the bullion business between London and New York was done on the day on which the calculation was made. Nothing could be more accurate, for it shows the price at which the silver in the coins could be sold on the days named; and if purchases or sales of silver were to take place they would be at that price. In making the calculation of the New York equivalent allowance has to be made for the difference between the English standard and our own, the rate of sterling bills on the day, the rates of insurance,

freight, etc., several of which items may change so that on two different days when the London price is the same the New York equivalent may not be the same. The bullion dealers are the only persons who in getting the New York equivalent must be accurate, and who, from the nature of their business, must make allowance for these items, which are too frequently overlooked in general calculations.

—A Western correspondent writes us :

"Two or three weeks ago there was some remark in the *Nation* as to the want of influence of our universities and colleges on public questions. There is one interesting fact : the one paper in Wisconsin which has been from first to last sound and unflinching on the currency question is the Madison *Democrat*, which has all this time been entirely controlled by university graduates. This is good, so far as it goes."

—The death is reported, at the age of seventy, of Dr. John Doran, one of the most industrious of English men of letters. He had but just published a work on 'London in the Jacobite Times,' and in the January number of the *Nineteenth Century*, which arrived here almost at the same time as the news of his death, there is a characteristic article of his on "Shakspere in France." Most of his books were but little more than compilations. The one by which he was most widely known, 'Their Majesties' Servants,' is a biographical and anecdotical history of the English stage from Betterton to Kean ; it is excellently put together, lively in style, and full of special knowledge. At one time editor of the *Athenæum*, of late years Dr. Doran has been editor of *Notes and Queries*, a post in which he succeeded Mr. Thoms, the originator of the paper, and for which he was admirably qualified. With the odds and ends of literature and the by-ways of literary history his acquaintance was extended and minute, as even the new edition of the 'Encyclopædia Britannica,' to which he contributed, testifies.

—The death, since our last issue, of George Cruikshank, breaks a link which united old times to new. The same man who, in his youthful strength, was the caricaturist of the dandies and their Turveydrop master, has designed and etched, for children who are children still, charming illustrations of fairy tales, and still later has given the designs for a Christmas book of what seems only "the other day." At the time that the first Napoleon assumed the crown George Cruikshank's etchings began to appear ; when Napoleon fell the artist was beginning to be famous. Throughout the stormy politics of the years that followed, a time of pamphlets and caricatures, he was the leading political caricaturist, wielding an influence of which we can but dimly conceive. Those of his works which Thackeray (surely no mean judge of such art as his) declared to be his favorites were produced during the few years after the death of George III., the time of trials for treason and Government prosecution for libel, conspiracies, and Peterloo massacres, and the trial of Queen Caroline. It seems almost as if one George Cruikshank had passed away in 1827, the year of Canning's death, and that a new one, a powerful and gentle book-illustrator, succeeded. For the past fifty years, indeed, it is by his book illustrations, both in woodcut and etching, that Cruikshank has been known. Perhaps the very culminating point of his artistic power is to be fixed forty years ago, at a time when the illustrations to Smollett and Fielding's 'Don Quixote' and the Waverley Novels had become famous, and when *Bentley's Miscellany* began to be published. In the first four years of that publication appeared the wonderful etchings to 'Oliver Twist,' those to 'Jack Sheppard,' and the 'Ingoldsby Legends,' and, by way of contrast, some of our artist's very feeblest work in the illustrations to Ainsworth's 'Guy Fawkes.' The *Comic Almanack*, with twelve etchings a year, occupies all the years from 1835 to 1853 ; these etchings were probably the best known at the time of all Cruikshank's work, and their average of merit is very high. The great Exhibition of 1857 supplied him with a seemingly inexhaustible subject ; this and the last years of the *Comic Almanack* mark the close of his strongest time. Since 1853 the amount of work produced by the great designer has been but small, and though some of it is very good and deservedly famous, it is of a less powerful designer than that of an earlier time. The 'Life of Sir John Falstaff' came out in 1858, the 'Fairy Library' in 1864, 'The Brownies' in 1870. Cruikshank died in his eighty-sixth year.

—We drew attention last year to the 'Théâtre de Campagne,' edited by M. Ernest Legouvé, the collaborator of Scribe in the play of "Adrienne Lecouvreur." Its two volumes contained fifteen or sixteen bright little plays suitable for parlor performance. Altogether the best of the editor's own contributions was "Autour d'un Berceau," a pretty and pathetic little monologue, the sole actor in which is a young mother. The monologue, as a form of dramatic composition, is a favorite in France, although unduly neglected among us. Influenced, perhaps, by the success which has attended the 'Théâtre de Campagne,' another publisher, Tresse, has issued two series of "Saynètes et Monologues." "Saynète" may be roughly Englished as a dramatic trifle, and most of the *saynètes* in these two volumes are indeed trifles—only the suggestion of a situation, deftly and delicately treated, two or three lightly-drawn characters, a few pages of dialogue, and nothing more. It is the many monologues which give novelty and value to these volumes. Certainly, it is surprising to see what variety and what vivacity can be given to a play in which there is only one part. The "Voyage dans mes Poches" of M. Charles Monselet is both witty and humorous. M. Léon Supersac's "La Porte est close," also in the first volume, is really a complete drama, in spite of its limited *dramatis personæ*. But the best things in the books are half a dozen monologues by M. Charles Cros, and of these "La Bonne," in the second volume, and "L'Affaire de la Rue Beaubourg," in the first, are especially amusing ; in the latter the monotony of the monologue is most ingeniously avoided by allowing the one actor to assume at times a second part. In short, these *saynètes* and monologues are most of them polished and pointed, few of them broad, and none of them long. They bear witness, also, to the growth in France of the study of English literature. There is a reminiscence of "Locksley Hall" in M. Paul Ferrier's "Le Roman d'un Pupille" :

> "Et qui vous aimerait, ayant tous ces défauts,
> Un peu plus que ses chiens, et moins que ses chevaux."

And nearly the whole of "La Perle," by M. Théodore de Banville, has been borrowed from Shakspere's "Antony and Cleopatra." The imitation is often very close and at times happy.

—The history of French operatic music, in all its minutest details, is getting itself written very rapidly. Of the very interesting and copiously-annotated catalogue of the Bibliothèque Musicale du Théâtre de l'Opéra we have already made mention. The first volume is now complete, and one instalment has been issued of the second, covering the years 1807–1826, and containing the portrait of Spontini, etched by M. Le Rat. The two succeeding numbers will, for most readers, be the most entertaining, for they will record the many brilliant successes of the past fifty years, "the epoch Rossini-Meyerbeer," to use the locution of M. Lajarte, the compiler of the catalogue. And while M. Lajarte is thus tracing the main itinerary of opera in France, more than one of his colleagues have been exploring its byways. M. Adolphe Jullien is the author of nearly a dozen musical monographs of varying value and bulk, of which not the least important is the latest, 'La Cour et l'Opéra sous Louis XVI.' (12mo, pp. 369. New York: F. W. Christern). In searching in the national archives for documents cited by M. Desnoiresterres in his excellent work on 'Gluck et Piccini,' M. Jullien came again and again upon the names of Salieri and Sacchini. Knowing how scant were the biographic details about these composers, whose lives and labors had been overshadowed by the conflict of their immediate predecessors and masters, Gluck and Piccini, M. Jullien felt his curiosity piqued ; he made a thorough investigation of the documents, discovering many new and important points in French musical history, which he has set forth at length in 'La Cour et l'Opéra.' His title is well chosen indeed; the paternal government managed the amusements of its subjects with as much intrigue, as much log-rolling and wire-pulling and pipe-laying, as it managed any other important affair of state. The volume—the separate chapters of which have previously appeared in two musical periodicals—contains two distinct biographies. The pages devoted to Salieri are the more interesting, and the chapter recounting the collaboration of Salieri and Beaumarchais in "Tarare" comes most apropos. Beaumarchais, after Gluck and before Wagner, enunciated the fundamental ideas which are to dominate the art-work of the future. M. Jullien points out many analogies between the words of Beaumarchais and the words of Wagner (see p. 250 et circa). He also indicates the similarity in character between Salieri and Beaumarchais, a similarity which rendered the execution by the composer of the musical suggestions of the author an easy task. Beaumarchais even went so far as to send Salieri airs which he had noted down, desiring the composer to use them in a given situation. M. Taine has likened Sheridan to Beaumarchais ; here is another point of resemblance, for Michael Kelly has told us that Sheridan, although he knew nothing of music, had this same feeling of musical effect. The author of the "School for Scandal" and the author of the "Mariage de Figaro" wrote each an opera, and both the "Duenna" and "Tarare" were marked successes. M. Jullien cites the malicious reproduction by one of Beaumarchais' critics, apropos to "Tarare," of the jest of *Figaro* : "Ce qui ne vaut pas la peine d'être dit, on le chante."

—Pasquale Villari, author of the admirable 'Life and Times of Savonarola,' has recently published the first volume of an equally important work, 'Niccolò Machiavelli e i suoi Tempi, illustrati con nuovi documenti' (Florence. 1877. 8vo, pp. xx.-647). No Italian, perhaps, except Petrarch has been the subject of so much study and has been judged so variously as Machiavelli. Like Dante and Petrarch, he has followed in his fame all the vicissitudes of his country, and has been upbraided as a traitor and lauded as a patriot. The cause of such diverse opinions is, as the author of the present work justly says, to be found in an ignorance of the Florentine statesman's times and circumstances, and to form a correct judgment of him one must be well acquainted with the Italian Renaissance. In order that the reader may have this necessary acquaintance with the period, Villari has prefixed to his work an introduction which is nothing less than an elaborate monograph of three hundred pages on the Italian Renaissance. This part of the book is divided into four divisions: The Renaissance; The principal Italian States; Literature; and Political Conditions of Italy at the end of the Fifteenth Century. In the first division the author gives a masterly review of the whole period, explaining in a luminous manner its contradictions and solving many of its enigmas. Then the five important states, Milan, Florence, Venice, Rome, and Naples, are separately and briefly discussed and their complicated relations unravelled. The next chapter is devoted to the rise and progress of Humanism, embracing also Italian literature. Although this subject has been so thoroughly treated by Voigt, Burckhardt, Von Reumont, and Symonds, the reader will still find Villari's treatment fresh and attractive. The final chapter of the introduction discusses the election of Pope Alexander VI. and the expedition of Charles VIII. into Italy, and vividly pictures Rome under the Borgias and Florence under Savonarola. The remainder of the volume is filled with a portion of the First Book of the life of Machiavelli, which embraces the period from his birth, in 1469, to his dismissal from office in 1512, the present volume ending with the year 1507. This period includes the interesting embassies to France and the more famous one to Cæsar Borgia, in the Romagna. More than a hundred pages are devoted to an appendix of documents, many now published for the first time and greatly adding to the value of the work. We cannot speak too highly of the manner in which Villari has done his work; he has ransacked the archives of Italy, and it must not be forgotten that we owe to this thorough search the invaluable despatches of the Venetian ambassador, Giustinian, edited by Villari in 1876. The author possesses a clear and attractive style, and, in spite of his strong convictions, is, it seems to us, candid and impartial. German and English translations of the above volume have recently appeared, the latter by the author's wife, who, we believe, is an English lady and a novelist of considerable power.

SCHLIEMANN'S MYCENÆ.—I.*

THE eager interest with which Schliemann's discoveries at Mycenæ have been received, not merely by scholars but by educated people generally, is a fresh testimony to the strong hold which Homer and the Homeric heroes have kept upon the popular mind. The previous discovery of Troy, still buried in its own ashes, made less than its due impression owing to the scepticism of scholars, not yet entirely abated, as to the possibility of identifying with Homer's Ilion any one of the five cities which Schliemann found piled on the hill of Hissarlik. But no sceptic has ever doubted that the massive fortress with its guardian lions which has stood on the hill of Mycenæ since the earliest dawn of history, was the home and the citadel of Homer's Agamemnon. The further question whether Homer's Agamemnon was, in the last analysis, a human being or a "Solar power" who "rescues the Dawn from the grasp of the Chief who has taken her away," has never disturbed the vast majority of those whom the 'Iliad' and 'Odyssey' have directly or indirectly reached. Ever since Dr. Schliemann telegraphed to the King of Greece in November, 1876, that he had discovered the tombs which tradition called those of Agamemnon, Cassandra, and the others who were slain on their arrival from Troy by Clytemnestra and her lover Ægisthus, and had found in them "immense treasures," sufficient in themselves to fill a large museum which would be the "most wonderful in the world," the work of excavation at Mycenæ has been watched with unabated interest. An account of the principal works of art and the human remains which were brought to light during the first few weeks has been given in the *Nation*, Nos. 601 and 603. These first announcements, alike astonishing and bewildering, were confirmed and supplemented by the later reports; but while we were dependent on Schliemann's own letters for our knowledge, it is not surprising that some allowance was made for a discoverer's enthusiasm and exaggeration. But independent testimony to the importance of the disclosures soon came in, especially after Mr. Newton, of the British Museum, had visited Greece and returned satisfied with what he had seen; and now Dr. Schliemann's large and elegant volume has brought the treasures before our eyes by more than seven hundred excellent illustrations, and confirmed the original impression that an archæological discovery second in importance to none since the finding of Herculaneum and Pompeii has been made upon the famous hill of Mycenæ.

It is true there are some things in the execution of this elaborate work which might have been improved. For example, we wish that the relation of the lithographed "Ichnography of the Royal Tombs in the Agora" (p. 124) to the larger "Panoramic View of the Excavations" (p. 148) were more clear, and that in the latter plan it were possible to make out with certainty any of the important objects of interest (besides Mrs. Schliemann in the foreground). It is provoking, after studying so extensive a plan, to be told that "the four sculptured *stelae* are hidden behind the large standing slab, just in front"; and then to hunt in vain for the unsculptured tombstones, in the belief that "two can be seen to the right, on the side of the entrance to the Agora" (which has no visible entrance), "and two more on the side (?) of the two horses" (when there are at least four horses at some distance apart). Again, we could wish that the weight as well as the size of the more important gold objects had been indicated; now we are left to judge by occasional intimations that they are "massive" or "thick." Perhaps the best information on this subject is that given by Mr. Gladstone in his Preface (p. xxxvi.), when he says that the gold treasure buried with the bodies in the first tomb weighs about 100 lbs. Troy, and is nearly equal in value to £5,000. But we would not seem ungrateful towards a work which, after all deductions are made, offers us a truly regal wealth of illustration.

One of the most interesting topographical discoveries is that of the circular Agora of Mycenæ, just within the Lions' Gate of the citadel. This was surrounded by two circular rows of stone slabs, slightly inclined inward, and covered with horizontal cross slabs, thus forming a continuous bench on which the people or the elders could sit when they were summoned by the king to an assembly within his gates. (For Homeric and other references to an agora of this nature see pp. 125, 126, 338, 339.) Within this circle five tombs were opened, in all of which were found treasures of precious metals, works of art, and human remains. The First Tomb was distinguished by the great amount of its treasure, including (as stated above) about 100 lbs. Troy of gold, although one of the three bodies there buried had been plundered of its ornaments in ancient times (as Schliemann thinks) by means of a shaft sunk from above. The other two bodies in this tomb had their faces covered by "massive" gold masks, represented on pp. 289 and 333. Seven of these remarkable masks have been found, one having the face of a lion (p. 211), a second (p. 199) supposed by Schliemann to have covered a child's face (though there appears to be no other evidence of the child's existence), and five with human features wonderfully delineated. These last are believed by Schliemann to be portrait masks, representing the actual faces of the deceased. This discovery opens a new chapter in archæology, and it would be difficult at present to suggest a better explanation. The only mask preserved without serious mutilation covered the face of the man who was buried at the south end of the First Tomb (p. 289); this shows a face of which even a "Jove-nurtured king" need not have been ashamed. The man who wore it, however, like a true veteran of Troy, mostly crumbled to dust before he could be photographed, leaving only a few bones which are "unusually large." But the body at the north end of this tomb was "wonderfully preserved under its ponderous golden mask," with its "round face" and "all its flesh," and with "thirty-two beautiful teeth," which led "all the physicians" who saw it "to believe that the man must have died at the early age of thirty-five." This body was squeezed into the space of 5 ft. 6 in., and since the man was "of large proportions," as is shown by his large thigh-bones, this squeezing had pressed his head into his breast, so that the top of the head was almost in a line with the upper part of the shoulders. The whole body, moreover, had been pressed to a thickness of 1 in. to 1½ in. By chemical aid it was mummified and carried to Athens. This wretched object, however, was once a king of men, if we may judge by the royal state in which he was interred. The choicest treasures were selected to do honor to his burial. A golden

* 'Mycenæ: A Narrative of Excavations and Discoveries at Mycenæ and Tiryns. By Dr. Henry Schliemann, Citizen of the United States of America; Author of 'Troy and its Remains,' 'Ithaque, le Peloponnèse et Troie,' and 'La Chine et le Japon' The Preface by the Right Hon. W. E. Gladstone, M.P.' Maps, plans, and other illustrations, representing more than 700 types of the objects found in the Royal Sepulchres of Mycenæ and elsewhere in the Excavations. New York: Scribner, Armstrong & Co. 1878.

shoulder-belt, 4 ft. long and 1¾ in. broad, lay across his loins, with the fragment of a double-edged bronze sword attached to it. A "massive golden breast-plate," 15⅞ in. long, and 9¼ in. broad, covered his breast, and the gold mask (p. 333) covered his face. Two bronze swords, with handles richly plated and ornamented with gold (p. 303), lay by his side, and a golden tassel (p. 304) was doubtless attached to one of them. Near by lay eleven bronze swords, one 3 ft. 2 in. long, with ornaments of gold. Among the articles of value in the tomb were 340 gold buttons, most of which were richly ornamented; five large gold cups, four silver cups, and a silver vase 2 ft. 6 in. deep and 1 ft. 8 in. in diameter (see pp. 308–332). Besides the five tombs within the circular Agora, a sixth was afterwards discovered outside of the Agora, but within the Acropolis; this contained no human remains, but treasures and works of art, among others the "marvellous" gold signet-ring pictured on p. 354 and elaborately described in pp. 354–359. It must be, indeed, more marvellous than beautiful. Four sculptured "tombstones" and various fragments of others, together with five plain slabs, were found early in the excavation; three of the former Schliemann thinks were part of a sepulchral monument built over the First Tomb (p. 337). Over the Fourth Tomb was found a circular monument of Cyclopean masonry, open at the top like a well, which Schliemann calls a "funeral altar."

Most readers of this volume, we suspect, especially those whose interest comes more from curiosity than from archæological tastes, will find themselves (perhaps unwillingly) chiefly engrossed with the obvious question whether Dr. Schliemann has actually unearthed, after a burial of thirty centuries, the remains of Agamemnon, Cassandra, and the other victims of the fatal banquet with which Ægisthus and Clytemnestra welcomed the victors of Troy home to Mycenæ. Schliemann's narrative is full of intimations that he felt a growing confidence in this result as he proceeded; and even Mr. Gladstone cautiously says (p. vi.) that it seems as though "the balance of rational presumption might ultimately lean" towards this belief. Perhaps the most remarkable argument in this direction on the slenderest evidence is reported by Mr. Gladstone. He has just mentioned the piteous tale told by Agamemnon's ghost in the 'Odyssey' at his famous meeting with Ulysses (which may fairly be considered the latest authentic news from the King of Men), and his complaint that Clytemnestra left him dying and refused even to close his eyes and mouth in death, and adds (p. xxxvii.): "Singularly enough, Dr. Schliemann assures me that the right eye [*i.e.*, of the body which was preserved], which alone could be seen with tolerable clearness, was not entirely shut; while the teeth of the upper jaw-bone did not quite join those of the lower"! We look in vain for any indication that the learned statesman winked either eye when he wrote this or when he heard it from Dr. Schliemann.

There is, however, a question infinitely more important than that of the identity of these human bodies with those of Agamemnon or Cassandra, which indeed must be settled before the latter can be intelligently discussed; we mean the question upon which the archæological value of the treasure of Mycenæ chiefly depends—to what age are the works of art and other relics found in these six tombs to be assigned? Fortunately, this question admits of an answer which is, on the whole, definite and satisfactory. There was one period, and only one, in the traditional and historical existence of Mycenæ, when such regal entombments as these could have been possible. If this consideration carries us far back into legendary times, it can do no more than the walls and Lions' Gate of Mycenæ have done long ago. Mycenæ boasted no common human origin. Perseus, son of Zeus and Danae, was its reputed founder. His son and successor, Sthenelus, allied himself by marriage with the new royal race whose power was fast spreading over the land. Nicippe, the new queen of Mycenæ, was daughter of Pelops, "the Lydian stranger," whose vast wealth, brought from his father's gold-mines, soon made him the foremost man in the country. Pelops was grandson of Zeus, and his wife, Hippodameia, was granddaughter of Ares. Mycenæ, with the rest of Peloponnesus, soon came under the dominion of the Pelopidæ; and Atreus, Thyestes, and Agamemnon are said to have reigned there as kings of that powerful dynasty. Under Agamemnon, according to the universal tradition, the glory of Mycenæ was at its height. No grander homage could be paid to the majesty of the King of Men than is found in the 'Iliad' (ii. 100–109), where the poet says that the sceptre upon which Agamemnon leaned when he addressed the Achæan host was made by Hephæstus and given by him to Zeus himself, then given by Zeus to Hermes, and by Hermes to Pelops, from whom it descended to Agamemnon. The Trojan war marks in tradition the era at which the royal house of Mycenæ felt so secure in its position, entrenched in its rocky fortress, that it could summon its vassals from all Greece for a war of foreign conquest. The wealth of Mycenæ at this period was as famous in story as her power. No other city in Greece was distinguished in Homer by the epithet "rich in gold"; and as her walls still testify to her strength, so the vast subterranean vaults, which in ancient and modern times have always been held to be hiding-places for treasures, bear witness to her enormous wealth. The treasures which such costly buildings could have been designed to protect must themselves have been of immense value. We have, therefore, the best of evidence in the shape of stone walls to support the legends which make Mycenæ the centre of power and the centre of wealth in Greece in the pre-historic period described by Homer, to which the great kings of the race of Pelops belong. But with the triumph of the Trojan war the traditional glory of Mycenæ suddenly ends. The terrible tragedies which stained the palace of the Pelopidæ, multiplied and magnified by poets and by the accumulated traditions of many centuries, are a part of the stories of civic convulsions which historians and poets alike ascribed to the strain of the Trojan war. It was the universal belief that the descendants of Agamemnon never fully recovered their ancestral dominion even over Peloponnesus, before the great revolution known as the Dorian invasion swept away the heroic monarchies and brought nearly the whole peninsula under the rule of a new race of Greeks. The history of Mycenæ after this is short and uneventful. We know little more than is told by Strabo, who says (viii. p. 372): "After the Trojan war, when the empire of Agamemnon was broken up, Mycenæ was humbled, and especially after the return of the Heracleidæ. These subjugated Peloponnesus and expelled the former rulers, in consequence of which the new possessors of Argos held Mycenæ as a dependency." This is what we should suppose to have been the fate of Mycenæ, from the absolute disappearance of so noted a city in history and tradition and from the growing importance of Argos. Finally, in 468 B.C., the Argives captured and destroyed Mycenæ, for the honorable offence (as we are told) of sending eighty men to join Leonidas at Thermopylæ twelve years before. From that time nothing is known of Mycenæ except from the description of its ruins given by Pausanias about 170 A.D. Dr. Schliemann finds evidence, which appears to be conclusive, of a later Greek settlement on the site of the ancient city (p. 63); but these later inhabitants must have been unconscious of the treasure which was buried beneath them, and they certainly cannot be suspected of having contributed to its increase.

The earlier and only glorious part of this story of Mycenæ is, of course, largely fabulous, and we are here dealing with demigods and not with common mortals. But our argument requires us to admit merely that this mythical period, full of famous names and immortal deeds, was a time when powerful princes, whose seat of empire was the citadel of Mycenæ, held dominion over the Argolic land, and that this dominion was brought to an end by the invasion of a new race and the establishment of new governments, under which Mycenæ was neither the seat of a royal house nor even the principal city of Argolis. This invasion, though surrounded by mythical incidents and based upon a mythical claim, must still be acknowledged to stand at least on the threshold of authentic history; for the change from the Achæan civilization described in the Homeric poems to the Dorian life, as it is found in historic times, is a fact too obvious to be questioned. When now excavations in this citadel disclose buried treasures such as no other ancient city has ever yielded; when these treasures are used solely in giving magnificence to the entombment of certain persons who are clearly of the highest rank and dignity, persons whom it is absurd to think of as living in the provincial town which Mycenæ became in the historic period; when, further, it is impossible to believe that such an amount of treasure could have been suffered to remain in a dependent town by the Dorian rulers of Argos, unless it had previously been consecrated to the memory of departed heroes; the conclusion seems irresistible that these treasures and the royal personages with whose remains they were buried all belong to the great heroic age before the Dorian invasion, the age which has heretofore been known to us only by the traditions of the families of Perseus and Pelops, and others equally mythical, by the romances of the Trojan war, and last, not least, by the solid testimony of the walls and gate of Mycenæ—the age, in short, of which Homer sang, and to which Agamemnon and Clytemnestra, Menelaus and Helen, Nestor, Achilles, Diomed, and Ajax all belong.

There are other and somewhat independent grounds for assigning the treasures of Mycenæ to the heroic age. The whole tendency of the Dorian race was to repress art and the higher civilization, and to sacrifice the

elegancies of life to military discipline and gymnastic training. We know the Dorians chiefly through the Spartans, of whom Plutarch says ('Inst. Lacon.,' § 4) that they learned to read and write because they needed it, but banished all other education as they did foreigners. The race cannot have been very different in other places; and though Mycenæ may have been partially exempt from Dorian influences by its secluded position, it cannot, on the other hand, have offered any such encouragement to domestic art as would produce works like those now discovered. Still less can Dorian Mycenæ be suspected of any such foreign trade as would import from abroad either the works of art themselves or foreign workmen who could execute them. On the other hand, when we pass the barrier of the Dorian invasion, though we are beyond the bounds of historic knowledge, we are in a region in which the Peloponnesian fables are full of foreign voyages, and the people appear familiar with foreign works of art. The names of Hercules, Perseus, Prœtus, Io, Danaus, Pelops, Menelaus, all suggest wanderings or migrations. Every reader of Homer is familiar with the works of art with which the Achæans are constantly assumed to be acquainted, and many of these are stated to be works of foreign artists. We mention only the breastplate of Agamemnon, which was a gift of the king of Cyprus, who had heard the fame of the great Achæan and the news of his armament against Troy (Il. xi. 19–22); Helen's silver work-basket with golden edges, which moved on wheels, and her golden distaff, both gifts of the wife of Polybus, who lived in Egyptian Thebes; and the two silver bath-tubs and two tripods which Polybus gave with two golden talents to Menelaus (Od. iv. 125–132). The magnificence of the dining-hall in the palace of Menelaus, which strikes Telemachus with astonishment (Od. iv. 71–75), and the whole style of the hospitality with which Telemachus and his friend are entertained in Sparta (ibid., 43–58), show a refinement and an elegance of living which were entirely unknown to the Dorian successors of Menelaus. Attention has repeatedly been called to the resemblance of the pottery found at Mycenæ to that brought to the British Museum from Ialyssus in Rhodes; this city had in its territory a settlement named Achæa, founded by "Children of the Sun"; and at the time of the Trojan war (according to the Homeric Catalogue) it belonged to the dominion of Tlepolemus, son of Hercules, who was an exile from Peloponnesus, and who sailed with his army to Troy in aid of Agamemnon (Il. ii. 653–657). Curium, in Cyprus, where General di Cesnola has recently found the treasures which are now in this city, was a colony of Argos (*i.e.*, Peloponnesus), according to tradition; and the king of Cyprus mentioned in the 'Odyssey' (xvii. 443) is called a son of Iasos, a name famous in Argive legends. Fabulous as all these stories may be, they are historical so far as they show a race in Peloponnesus whose traditions are full of maritime enterprise and adventure. Surely no such legends could have clustered round a race of Dorian kings.

TWO CALVINISTIC MINISTERS.*

THE impression produced by the first of these books is a vivid sense of the power and compact organization possessed by the Calvinistic Church in New England. Its roots struck so deep in the political and social existence of past generations, its powerful metaphysics so trained and strengthened the minds of its adherents, it required and it produced such a strength of conviction and such a power of endurance, that it fitted them to be citizens of no mean city; and it is nowise a figure of speech to say that the Westminster Catechism produced the American Revolution. What did cold and hunger and poverty matter to a man whose entrance to a near heaven was secure to him as the threshold of his own meeting-house? What heed was he likely to pay to Orders in Council, or any government but of his own choosing, who had fought the battle of freedom and foreknowledge, of election and depravity, and found his own peace in the "covenanted mercies"? They were not agreeable or tolerant or perhaps *tolerable* individuals, but they were capital material to make a state out of. They burned their neighbors with composure for the greater glory of God; they looked forward hopefully to the heaven whose transparent floor should enhance their joy by the sight of the torments provided for sinners and unbaptized infants; they accepted fully the statement that few should be saved; the pleasant things of life disappeared where they lived—but what modern creed will furnish us with such an enduring fibre?

Dr. Woodbridge was a worthy successor to the powerful and pitiless men who made Northampton and the beautiful region thereabout the headquarters of pure Calvinism. He was born in Southampton in 1784, and had on both sides an ancestry beginning in England as dissenters and continuing here as strong Calvinists. The matter of his descent, like a good deal of the book, is confusedly stated, but we make out that he was the seventh John Woodbridge in a direct line. As a very young man he lived a fair life, and began early to study law. His mother and a friend were earnest in his behalf, and are characterized by Mr. Clark as follows: "Those wrestling mothers! A scene for a painter!" At twenty-six years old, in 1810, he had been "converted" during a revival and was settled in Hadley, where there was but one church, and the parish and the town were conterminous. There he remained for twenty years, administering orthodoxy pure and undefiled; fighting the perilous "New Divinity," which taught that attendance on the Lord's Supper was a means of grace; training the farmers, who formed a large portion of his parish, "to think, to discriminate, so that they understood the distinctive difference between Sabellianism, Pelagianism, Socinianism, Arminianism, Unitarianism, as well as the more modern forms of error from German rationalism." How many of our readers are competent to that? At Hadley, according to Mr. Clark, "sometimes gathering into his grasp masses of inspired truth, he hurled them with herculean strength"; here he made pastoral visits, when, calling up each member of the family, "he spoke to each one in regard to their soul's interest in the presence of the others"; here he "preached all day long on the Deluge"; here he refused to concur in the ordination of those whom he found unsound on the cardinal points of "God's absolute sovereignty and man's freedom, and, notwithstanding his absolute depravity, his full responsibility."

After twenty years of this life he accepted a call to the Bowery Church in New York. This church had sunk into a truly shocking condition. "Doing seemed to have been thought of more importance than believing," and both attendance and money were scanty. Dr. Woodbridge was not the man for the place, and left it after six years' vigorous application of orthodoxy to their spiritual and temporal needs, tried two other places, and finally returned to Hadley in 1842 to take charge of a part of his old parish. Here he worked fifteen years longer, consistently setting forth everlasting punishment, and endeavoring to "alarm the sinner and awaken the weeping solicitude of the Christian." After his wife's death the old man went to live with his children in Chicago, and died in 1869 in his eighty-fifth year, a strong and upright man whose convictions one may respect without sharing them.

Dr. Kirk's biography is in marked contrast to Mr. Woodbridge's. The times change, and we change with them, and Dr. Kirk, though holding suitable opinions on death and damnation, was by nature more inclined to persuade than to threaten. He was of Scotch descent, and, like Dr. Woodbridge, began with the study of law. In March, 1822, a friend persuaded him to call on Dr. Spring, whose directions were: "Leave your law-office. Go to your room. Determine never to leave it except as a Christian or a corpse." The result of three days of this regimen was a satisfactory "conversion," and young Kirk entered the Theological School at Princeton in a few months. He was first established in Albany, where there was a *split* in the Second Presbyterian Church, and the Fourth Church was organized under his ministry. It met in an old hall in a poor part of the town, and "the first sign of the influence of the church upon the community was manifest when people began to paint their houses and fences."

Here, as elsewhere throughout his life, Dr. Kirk was a firm believer in revivals, accepted their machinery and trusted their results; and Mr. Mears says "the methods of Moody are substantially those of Dr. Kirk." After eight years' work at Albany he went on a long visit to Europe, whence, it must be confessed, his letters are singularly uninteresting, but where he gained a facility in speaking French to which his friends allude with an almost awe-struck admiration. Two or three years were spent, after his return, in assisting sundry revivals and preaching here and there with great acceptance, until, declining many other calls, he came to Boston to organize the Mount Vernon Church in 1842. He preached here for thirty years to a devoted and admiring congregation, using the accredited formulas but bringing a power of facile oratory to their exposition which made him a successful and renowned preacher. He says of himself, "I aimed at reaching the emotions, and shall while I live," and his personal gifts of voice and presence were effective aids. He was popular, attractive, and successful; if there were severe trials in his life, if he had any mortal liabilities, they do not appear in the biography, and a certain lack of human interest inevitably follows.

HILLEBRAND'S FRANCE UNDER LOUIS PHILIPPE.*

THIS work could scarcely have appeared more opportunely—in the midst of a fresh struggle between the powers for evil and the powers for good in France, and on the eve of a victory for the latter. The present volume treats of the first seven years of Louis Philippe's reign, or, as Hillebrand aptly calls it, the "storm and stress" period of the bourgeois monarchy. At first sight the reader might be disposed to think seven hundred pages a too liberal allowance of space for seven years; but the author assures us that the remaining volumes will be planned on a smaller scale, and pleads the necessity of introducing in the initial volume all the characters and starting all the springs of action. This he has done with the exception of the philosophical and clerical movements, socialism, and finance, which are to find a more appropriate place in volume second. Both plan and execution, we are persuaded, will meet with hearty approval.

Prof. Hillebrand is evidently no friend to the philosophic treatment of history. He inclines, we think, too much to the opinion that the historian who depicts political leaders at work, who sums up results and assigns to them immediate causes, has done enough. For such a conception of the historian's functions there is at the present day a certain transitory *raison d'être*. It is the symptom of a reaction against the excessive tendency to generalize and to philosophize at the risk of sublimating conscious political action under self-appointed leaders into mere ethnic psychology. So far as the author's treatment is a rejection of ethnic fatalism and a vindication of the claims of the personal element in politics, we can only wish him success. But Hillebrand is too clear a thinker not to be willing to admit that there are such things as national character, inherited instincts, limitations imposed upon every leader by his age and his associates, and that it is a part of the historian's duty to exhibit the vital structure of the past under light that has been, so to speak, carefully polarized. There is all the more danger of misunderstanding the recent past because it is recent. No cultivated reader is likely, for instance, to misjudge the temper of the age of Louis XVI. The *ancien régime* has acquired for us sharply-defined outlines and permanent colors. But who shall depict for us the age of Louis Philippe just as it was, and shall make clear to us how nearly it resembles our own, and yet how radical the difference? Who, indeed, unless the professed historian? And that Hillebrand has not attempted it, has not even considered it his duty to make the attempt, is a defect which we regret all the more because of our conviction that he is eminently qualified for precisely such a task. The author of "Zeiten, Völker, und Menschen" has given too many proofs of his skill at generalization and close analysis to plead exemption.

On the other hand, judged from his own point of view and according to his own plan, Hillebrand has executed his work in a masterly manner. Free from all verbiage, all high-sounding phrases, without a trace of that air of superior wisdom and apocalyptic virtue which has infested most German writers since 1870, he treats France and French politics with the kindness and sympathy of a friend who is afraid neither to praise nor to blame. It is easy to read through the lines and perceive that Louis Philippe is not the author's ideal. In his eyes the burgher-king is a hopeless compromise between divine right and popular sovereignty, a station on the road to Cæsarism on the one hand and a true republic on the other. Yet Louis Philippe is dealt with fairly, and his many good qualities obtain ample recognition. Hillebrand's ideal, so far as he can be said to have one, is unquestionably Casimir Périer. In fact, the first three hundred pages are little more than a warm tribute to the memory of the great Frenchman who piloted the ship of state through the stormy years 1831 and 1832, and made Louis Philippe's reign a possibility. No one can read these pages without conceiving a high admiration for Périer, so energetic, so clear-sighted, so loyal to his principles and his country, so prematurely cut off. Next to Périer, Talleyrand comes in for the largest share of praise. There is something almost touching for its quaintness in the character of the veteran diplomatist, a relic of the *ancien régime*, unable to shake off wholly its prejudices and traditions, yet never failing to repress them when the real interests of France demanded the sacrifice. Those who are specially interested in Continental politics will do well to compare Hillebrand's treatment of the Belgian imbroglio and of the chief actor on the Belgian side, Van de Weyer, with Laugel's account in his 'Grandes Figures Historiques.' The two authors do not disagree, but they present the subject from different sides. No less interesting and valuable are Hillebrand's portraitures of Lafayette, Guizot, Thiers, and Broglie. The true strength of Thiers and the organic weakness of the other three are shown clearly and justly. The vibrations of parliamentary life, the portentous looming-up of the fourth estate, the romantic and fatal episode of the Duchess of Berry, the first appearance of Louis Napoleon on the stage at Strasbourg, the several *attentats* upon Louis Philippe, the shameless demagogism of the republican press—these and all the other factors in the internal life of the nation are set forth in a manner that evinces the author's careful study, his thorough mastery of details, and his accurate sense of proportion.

In respect to his judgments upon the foreign relations of France during these seven years Hillebrand enjoys a double advantage. In the first place, he has had access to German and Italian archives containing the reports and other confidential communications from the various foreign representatives in Paris to their home governments. These reports embody occasionally facts hitherto unpublished, but their chief value consists in the new light they throw upon the motives and conduct of the French leaders, and upon the varying phases of opinion in the capital. A notable instance of secret history thus brought to light is the account of Broglie's famous circular rescript, excepting Piedmont from the so-called "non-intervention" policy, and the *démentis* to which it gave rise (see pp. 552–555, and especially the notes). The duke's convenient faculty of forgetting is exposed in anything but flattering colors. The tergiversations and intrigues of Louis Philippe himself are also laid bare. The despatch of October 18, 1833, from Baron Werther, Prussian Ambassador, to Ancillon contains an extract from an alleged secret memorandum dictated by Louis Philippe to his private secretary (quoted p. 558, note) which, when connected with the cipher instructions to the frontier prefects and to the division-commanders at Metz and Châlons, and with the pretensions of the French representatives at Frankfort and Turin, renders it highly probable that the king was at that time busy with the scheme of a Rhine and South-German confederation under the protectorate of France. We cite this passage, partly to show the author's fulness and partly to justify our previous strictures. If there be any one point more than another calling not merely for statements but for explanation, in every French history written since 1870, it is precisely this "Spuk" of an alliance between the minor German States and France against Austria and Prussia. It sounds to us in this year 1877 so much like a chimera that the historian is under obligation to show how it was a sober possibility, in the eyes of Frenchmen at least, in 1833, and even as late as June, 1870.

In the next place, the author is not a Frenchman but a German. His familiarity with French life and ways and character is too great to require our commendation, yet he himself remains a disinterested and impartial observer. His tone is throughout friendly to the real interests of France. He is incapable of taking a chauvinistic pleasure in the mistakes and misfortunes of a rival nation. He evidently shares the belief, although he does not publicly express it, that a strong and united France is a necessity to Europe—no less, but no more, a necessity than a united Germany or a united Italy. His manliness and perfect good sense are among the most attractive features of his work.

The Cyclopædia of Biography: a Record of the Lives of Eminent Persons. By Parke Godwin. New Edition. With a supplement, brought down to August, 1877. (New York: G. P. Putnam's Sons. 1878. 8vo, pp. 821 and 332.)—The first edition of this book appeared in 1851; the second in 1866, with a supplement by George Sheppard; who is the author of the new supplement we are not told. We reviewed the second edition at the time of its appearance, and pointed out a large number of errors and other shortcomings. None of even the most glaring errors to which we called attention has been corrected in the original parts of the work, the first 821 pages appearing now, so far as we can judge, without the alteration of a letter: George Washington, for instance, is still stated to have been born in Fairfax (instead of in Westmoreland) County, Virginia, and Prince Poniatowski to have fought bravely in "1812, 1813, and 1814," though he "was drowned in attempting to cross the Elster" at the close of the battle of Leipsic in 1813. None of the notices omitted has been inserted, so that this "comprehensive" record of eminent persons again gives—to use our former words—"all the Artaxerxeses, but no Xerxes; all the German Conrads, but none of the Othos, Maximilians, or Leopolds; all the English Henries, but neither William the Conqueror nor William of Orange; all the French Charleses, but none of the Philips, not excepting Philip Augustus; a number of Spanish Alphonsos, but no Philip, not even the Second; all the Turkish Achmets, but no Mohammed (Sultan), Solyman, or Selim; no Attalus, Herod, Ptolemy, or Seleu-

* 'Geschichte Frankreichs von der Thronbesteigung Louis Philipp's bis zum Falle Napoleon's III. Von Karl Hillebrand. Theil I. Die Sturm und Drangperiode des Julikönigthums, 1830–1837.' Gotha: Perthes; New York: Westermann. 1877.

cus," etc., etc. Nor does this unaltered condition of the original work much surprise us, considering the amount of alterations in the old plates required to fill up the gaps and obliterate the mistakes. What surprises us is the coolness with which the preface to the edition of 1866 is, without the change of another word, made to be a preface dated "Riverside, August 29, 1877," and, though *nothing has been supplied*, to repeat these words: "In the present edition an attempt has been made to supply the few notable names that had been omitted." The separate statement concerning the "Supplement," however, is correct, since that has really been made "copious," being more than doubled in extent. The new matter in it is also on the whole incomparably better than the old, and it is to be regretted that side by side with a large number of readable and generally correct notices of persons of all countries, now added, the poorest titles of the "Supplement" of 1866 have been left standing in all their deformity. Thus, on the same column which contains twenty-three lines on the banker Mirès we find this notice of Poland's greatest poet, Mickiewicz: "Mitzkievitch [*sic*, sing.] Adam, a Polish poet and professor of the Slavonic language [*sic*, sing.] in the college of France. D. 1855"; and directly after twelve lines on Abdul-Aziz, the following biography: "Abdul-Medjid, Khan, sultan of Turkey, b. 1822; d. 1861." We are not even told when the poet was born or when the sultan ascended the throne. Priessnitz reappears as "Pressnitz," and Nakhimoff as "Nachimoff." Oscar I. of Sweden, Frederic William IV. of Prussia, and Maximilian II. of Bavaria, whom the compiler of 1866 forgot to enter, are also forgotten in 1878, while Frederic William of Hesse-Cassel and Leopold of Lippe, both of whom died in 1875, are duly, or unduly, recorded. Slips in the new matter are much rarer than in the old. We have noticed, among others, the following: Freiligrath is entered as "Freilegrath"; his death is forgotten; so is the birth of Napoleon III.; Benedek, the vanquished of Sadowa, is noticed, though falsely reported dead (the book contains no living persons); "1847" stands for 1848 as the year of revolutions, in "Ferdinand I."; and "September 21" for September 20, as the date of the battle of Chickamauga, in the notice of General Thomas.

Foreign Classics for English Readers. Edited by Mrs. Oliphant. 'Voltaire.' By Colonel Hamley. (Philadelphia: J. B. Lippincott & Co. 12mo, pp. 204.)—There is no author more worthy than Voltaire to form one of a series of foreign classics. He not only stands in the first rank of literary merit among the writers of his nation, but is in every respect an author very characteristic of his nation. Nor is he eminent in literature alone, but is one of the small class of purely literary men whose literary career is an historical event; for however great or small may have been his direct influence in producing the French Revolution—a question which Col. Hamley leaves undecided—there is no doubt that he is the most prominent representative of that tendency of the French mind in the eighteenth century out of which the Revolution grew. But there is another even stronger reason for conferring this honor upon him, viz., that probably no writer of equal eminence in all history has been the object of such violent and unmerited abuse. Col. Hamley has appropriately begun by recalling to memory the unreasoning obloquy with which Voltaire's name was covered in his own time and for many generations after—a feeling which found suitable expression in Dr. Johnson's doubt whether he would rather sentence Voltaire or Rousseau to transportation in the plantations. From this beginning it would not be possible at the present day that a candid review of his life should not, on the whole, have the aim of vindicating his character and influence. His own words (p. 186) in reference to the church which he rebuilt at Ferney with the inscription *Deo erexit Voltaire* are most significant: "The church that I have built is the only church in the universe that is dedicated to God alone—all the others are dedicated to saints. For my part, I would rather build for the master than the valets."

It is not that Voltaire is made out to be a perfect character, any more than an author of the highest rank. He shared in both respects the limitations of his nation and his age. As a man he was not in advance of the society in which he lived; nor, certainly, was he below its standard. As a writer he produced works which we are glad to read at the present day, but which nevertheless nobody need feel himself much the poorer if he has never read. If he is the highest name in French literature, it marks the essential inferiority of French literature that there is not one of his writings which ranks among those which every educated man must know—by the side of "Hamlet" and "Faust" and the "Iliad." Probably to most persons this little volume, which is excellently edited, contains all of this great man which they will care either to read or to know; but the strongest impression gained from it will be that he did a real service to the world in behalf of humanity, a service for which the world has only just begun to be grateful.

NEW YORK, THURSDAY, FEBRUARY 14, 1878.

The Week.

THE Louisiana Returning Board trial has resulted in the conviction of Anderson with a recommendation to mercy, the jury having been out only forty minutes; the conviction was obtained entirely on the Mount Vernon parish returns. He has moved for a new trial on the ground that one of the two colored jurors was a minor, and that therefore the trial took place before eleven jurors, and also that one of the jurors had, a few days before the trial, expressed his belief in the prisoner's guilt. The result seems to make Wells's conviction certain, and appears to have thrown the "visiting statesmen" at Washington into a state of considerable excitement. Messrs. Sherman, Stanley Matthews, Garfield, Eugene Hale, and Harry White have united in a letter to Anderson, expressing their belief in his innocence, and in the falsehood and malice of his persecutors, and their hope that "the sense of justice and love of peace of the people of Louisiana will protect him." Mr. Sherman during the trial, we believe, wrote to him to the same effect, and is now loudly denouncing the court, the jury, and the people of Louisiana and the whole South to the newspaper reporters. The defence put forward for the prisoner by his Northern friends is that the jury was packed to convict; that the judge who tried the case is a defaulter to the United States Government to the extent of $600,000; and that anyhow Anderson's offence, if real, is political, and ought to have been covered by President Hayes's goodness in setting up the Nicholls government.

The unseemliness of Mr. Sherman's course, as a Cabinet officer, in denouncing a State court during the progress of a trial, and writing sympathizing letters to the prisoner, is, of course, apparent to everybody. But it is the natural and inevitable result of his first indiscretion as a United States Senator in going down to meddle in a local election, the result of which was very likely to come before him as a judge in Congress, and in point of fact did eventually do so. Neither he nor Messrs. Garfield and Hale had any business to turn "visiting statesmen," or to form part of any partisan body appointed to superintend a Presidential election in a distant State. The commission appointed by General Grant to go to Louisiana during the count ought to have been composed of men of high standing of both parties, and not of the active, expectant friends of one of the candidates. Therefore the sweeping certificate of character which the "statesmen" gave the Returning Board did not win popular confidence for their performances, and gave the "statesmen" the air of confederates in the eyes of those who believed the Board guilty of fraud. For all these reasons, and others, the new certificate will not now help Anderson; and it follows the first one as a matter of course. We may add that the appointment of Wells, Anderson, and their clerks as custom-house officers after all that had occurred, and in view of the fact that half the voters of the United States believed them knaves, was not only not "civil-service reform," but was just the thing to keep up popular irritation in Louisiana, and provoke the legal attack on them which is now proving successful. It is, perhaps, well for the cause of reform, however, that these little compromise measures, of which the President seems so fond, should not succeed. He will yet have to make his reform "thorough, radical, and complete," or succumb.

As to the character of Judge Whittaker, who presided at the Anderson trial, it is difficult, with the means at our disposal, to pronounce any definite opinion on the charge of defalcation made against him. He is a native of Massachusetts, and the case against him is that, being Assistant Treasurer in New Orleans in 1866, his cash was found "short" by about $1,100,000, which he accounted for in part or in whole by having deposited it in a national bank which failed, and with the managers of which he was accused of complicity. Being indicted and tried for the same, he was honorably acquitted, his friends say, by the jury without leaving their seats; while his enemies aver that this hasty action of the jury was taken in the teeth of the evidence, owing to their being "unrepentant rebels." That he may have defaulted and Anderson still be guilty is, however, not impossible or improbable, as Secretary Sherman apparently thinks.

In any case, a judge that is good enough for the people of the State is good enough for the Returning Board. It is shocking, no doubt, to have a defaulter on the bench—if defaulter he be—but it is on behalf of the whole community that the thing is to be protested against by outsiders, if at all. There is nothing in Anderson's case or Wells's to entitle them to be tried by an exceptionally pure man. Judge Whittaker's charge lies before us, and appears to be extremely careful and fair. The principal point in Anderson's defence is that the forgeries and alterations in the Mount Vernon returns were done by Littlefield, the clerk, to qualify himself to be a Democratic witness, and no language seems to be considered too strong on the part of the "visiting statesmen" in describing the badness of his character. They are right in this; but he was appointed by the Returning Board with a full knowledge of his character. When they gave him the place he was a noted loafer in "stables and bar-rooms," according to his own account, and held a sinecure in the New Orleans Custom-house at $83 a month; of the other clerks, four were under indictment, one for murder and another for obtaining money under false pretences. We believe they are all now, except Littlefield, lodged in the custom-house. That Anderson had less to do with this dirty work than Wells, or perhaps left it all to him, we think is very likely; he is a much more respectable man. That Wells did it cheerfully is not surprising; General Sheridan testified as early as 1867 "that he had not an honest man among his friends." The thing for the President and Cabinet to do now is to let the law take its course. They are not responsible in any manner or form for the doings of State courts, and threats and denunciations will be both unseemly and mischievous. Any embarrassment there is in the situation falls on Mr. Sherman, and he fairly merits it.

The most important contributions to the financial discussion during the week have been a letter of Mr. Belmont's and a speech of Senator Hill, of Georgia, the "Ben Hill" whom Butler was elected "to take care of." The letter is in terms a severe castigation of Mr. Hendricks, who seems to be running a race in demagogy and tergiversation with Mr. Thurman, of Ohio, either of whom is apparently ready to say anything to be on the side of the majority, and both of whom will soon have changed opinions so often as to endanger their sense of personal identity. Mr. Belmont convicts the worthy Hendricks of having in 1874 or 1875—that is, after the demonetization of silver—maintained that the public debt was payable "exclusively in gold," but he now says that when he said "exclusively in gold" he meant "silver," or "silver or gold." What he will say he meant a year hence, of course nobody knows. After disposing of Hendricks, the writer goes on to show that the Act of 1873 was really a pledge to the public creditor, waiving the right to pay in silver; that the right now claimed by the Bland Bill to repeal it and pay in silver, silver having greatly depreciated, is the assertion of a power over private property which a czar or sultan would not dare to claim, and that if this act is not binding on the public conscience, no other is; that the power of Congress over the coinage has to be exercised within the restrictions imposed by the national faith towards its creditors; that the steadiness given to the United States

bonds by the Act of 1873 has been of enormous benefit, owing to the fact that the $1,300,000,000 out of $1,726,000,000 which, according to the best estimates, are held in this country, and nineteen-twentieths of them by savings-banks, trust companies, and private estates, have thus during the last three years of financial disaster been saved from the terrible depreciation which has overtaken every other species of property. He further shows how the perpetration of the pending silver fraud will increase our present burden of interest, and will, by robbing us of our gold and deluging us with foreign silver, put it out of our power to reach bi-metallism in the only permanent way, by concert with foreign nations. The letter ought to be circulated among those of the silver-men who are still in even partial possession of their reason.

Senator Hill's speech was "ringing," and, while eulogizing silver, proposed to make it a legal tender only for amounts under $100. He denounced the Bland Bill in strong terms, declaring it "the pickpocket bill of American legislation." He was also very severe upon those who hold that because we were glad to borrow money during the war at sixty cents on the dollar, we are now entitled, in spite of our bargain, to pay the bonds off in depreciated currency, no matter in whose hands we find them, or what the holder may have paid for them. Some of the remarks which the friends of honest courses have to make on this subject have the simplicity of the exhortation of a prison chaplain to a band of recently-arrived convicts. Mr. Hill's peroration is worth quoting and remembering, especially by the constituency which sent Butler up to Washington:

"There was but one patriotic course for Congress to pursue—call back the people to an honest renewed recognition of the obligations of contract; teach the present generation, teach all generations, that fidelity to truth and law was the best religion, the wisest statesmanship, and the truest patriotism."

Mr. Conkling has not spoken on the Silver Bill, and it is now said that he is going to reserve himself for the debate after the veto. The probability is, however, that he is so absorbed in studying "the mechanism of government," as the *Tribune* says, that he has no time for the products of government. He and others like him enjoy the working of the loom so much that the kind of cloth produced has no interest for them. There are sinister rumors from Washington that there need be no difficulty in sustaining the President's veto, if he will only intimate to certain Senators that he needs their votes on the usual terms; which reminds one of a duel that occurred in California the other day, where, after the first fire, one of the combatants offered to "settle" for $275, and not a cent less. The Senate, in fact, seems to be getting into the condition of the Prætorian guards or the Janissaries, who, in their later days, would never fight without largesses of some kind. At present Senators require offices before they will consent to legislate; as the years roll on they will probably take their compensation in produce, or negotiable securities, or plain money.

It would be nearly correct to say that Congress has during the week not advanced the public business a single step. Everything waits on the passage of the Bland Bill in the Senate, and the debate has still no visible end. Mr. Blaine delivered himself on Thursday, and has since learned, what he might have known before, that the compromiser with his plumper though still short-weight dollar excites the rage of the silver-men even more than the out-and-out "goldite." The Cincinnati *Commercial* calls his plan "the meanest and most foolish and insolent proposition that has come before the American people." The speech was a wasted "effort," except as a test of character. Besides Senator Hill, of Georgia, another Democrat, Senator Kernan, of New York, took his stand on the side of the national honor, on Wednesday week, on which day also Senator Christiancy introduced a well-meaning substitute for the Bland Bill, providing an awkward *modus vivendi* for the two metals, with gold as the standard, and the Senate chaplain made his contribution to the discussion by reminding the Almighty in his prayer that "the silver and the gold are Thine, and the cattle upon a thousand hills"—an argument which has an equal bearing on the duties on hides. On Tuesday the Senate passed a bill which promises to lead to enlarged or wholly new accommodations for the National Library, and a bill for the purchase of the Freedman's Bank Building, by which depositors will be gainers. The House has rejected a Southern war-claim by a non-partisan vote, and has refused to amend the Military Academy Appropriation Bill by cutting off the extra pay of first lieutenants employed as instructors.

"Adjustment" is still the preoccupation of the Virginia Legislature, nor does an agreement between both houses, or between them and the public creditor, seem highly probable. While the House is considering with favor a gross repudiation measure, the Senate has passed a milder one, which provides for the issue of new four per cent. bonds dated July 1, 1878, payable in thirty-four years, but redeemable after ten, and with semi-annual coupons receivable for most State dues and taxes unless in time of war or rebellion. For these the holders of various classes of consolidated bonds, having already tax-receivable coupons at a higher rate of interest, may (which means *must*) exchange the latter; and when this exchange amounts to three-fourths of the consolidated debt, the so-called "peeler" bonds may be likewise exchanged for their face, and other unfunded bonds and stock for two-thirds their face. This is regarded by Virginians who desire the State to fulfil its obligations as a respectable and honorable proposition, and as, at all events, a pledge that the more unblushing designs of the House must fail to receive the Senate's approval. They lay great stress on the tax-receivable coupons, and apparently the holders of the non-consolidated debt may find in this a security which will compensate them for the docking they receive in principal or interest or both; but of course this security has no real basis. The admission of the right of the State to force its creditors to accept less than they were promised leaves their claims at the mercy of the first rascally legislature, which may begin by taking away the receivability of the coupons. That such contracts differ in kind from private contracts has been openly asserted in the Virginia House, which has been asked by one of its members to declare its opinion that the United States Constitutional prohibition against State legislation impairing the obligation of contracts applies "only to the case of private contracts, and not to the public debts of this Commonwealth." General Taliaferro admitted that this interpretation was in accordance with the contemporaneous views of Governor Randolph and Luther Martin, but opposed it as a long since judicially-branded heresy.

It cannot be said that the integrity of Virginia suffers as yet in comparison with that of South Carolina. In 1874 this State arranged a settlement with its creditors under a consolidation act which reduced the debt from about $16,000,000 to $6,000,000. This was not a wanton procedure, but rested upon the well-known fraudulent character of a large and indeterminable proportion of the bonds issued under the carpet-bag régime. Very likely the State profited as much as she was entitled to, especially at the expense of innocent holders; at all events there was supposed to be an end to all further question about the validity of the debt when once the consolidation securities were issued. Now, however, the Bond Commission makes a long report to the Legislature, and though it can find less than a thousand dollars' worth of consolidated securities that have been issued otherwise than "in proper form," it declares that only about $1,600,000 of them are absolutely good, while the rest are tainted. The explanation of the taint goes back to the doubtful character of some of the bonds exchanged for these securities—in other words, to the very occasion and basis of the compromise made in 1874 with the State's creditors. This is a very remarkable mode of impairing obligations, and one to which there is no end or limit. Another concession of 50 per cent. by the creditor, leading to a fresh issue of consolidated bonds, will after a little interval call for another commission, another "going behind the record," and a third repudiation, and so on.

It is clear that the Virginian adjusters have something to learn from South Carolina; and so, let us add, have all compromising creditors.

The events of the week which most concern Wall Street have been the silver debate in the Senate, the war news and its effect on the London money market, and the differences between the trunk-line railroads. The silver debate has not made any clearer the question whether the 412½-grain dollar will be restored as a full legal tender, and reports at the close of the week are as conflicting as ever. In this city the prevailing opinion is, however, that there will be some providential intervention—exactly in what form no one seems capable of even guessing—to prevent such a consummation. Between the conflicting opinions gold has stood at 101⅞a102¼. The agitation of the London market in consequence of the Russian advance upon Constantinople made consols fluctuate between 96⅛ and 95½, closing near the lowest price. According to the vote of the £6,000,000 asked for by the Government for military and naval purposes, this extra credit is to take the form of an issue of Exchequer bills; they will relieve the London market, to the extent of their issue, of an equal amount of surplus money which is now weighing down the discount rate in that market. U. S. bonds continue to return home from the European markets, and, large as is the amount that has already arrived, it has thus far proved insufficient to pay for our heavy exports, and some gold has been sent here; the amount started from London for New York during the week was little, if any, less than $1,750,000. The trunk-line railroad managers have found it impossible to arrange so as to prevent discrimination against New York on Western-bound freights. In Eastern-bound freight one or two large receivers of grain here have special arrangements which enable them to monopolize the business. Report says that they pay 20a22½ cts. per 100 lbs., while the schedule rate is 40 cts. The merchants are becoming aroused, and a lively "war" is expected even before the reopening of navigation. At the close of the week the gold value of the paper dollar was $0.9803; and the gold value of the 412½-grain silver dollar would have been $0.9029.

The Pope died on Thursday last in his eighty-sixth year. We have made an attempt elsewhere to fix his relations to the great political and ecclesiastical changes which occurred during his reign. His death is of great importance as being likely to force on the Cardinals the decision of the question whether the Church shall now relegate herself to a purely spiritual rôle, and give up the hankering after a restoration of the temporal power which has kept her in hot water ever since 1870; and the necessity for this decision will probably exert a powerful influence on the Conclave. But the question is not nearly so important as it would have been even five years ago. Germany has been so successful in her war against the Ultramontanes that Bismarck is said not to care what the Conclave does. The powerful effort made by the clericals to seize the Government in France, probably in preparation for this very juncture, has totally failed, and the party now in power is probably as indifferent as the Germans. The same thing may be said of Austria and, though in a less degree, of Spain. In fact, the only Catholic Power which is thought likely to wish to use the veto to which they are all entitled is the little kingdom of Portugal. The only other question of interest is whether, now that the temporal power is gone, the Italian cardinals will be willing to let a foreigner into the Chair of St. Peter, in recognition of the changed relation of the Pope to the world. It is not likely, however, that they will do so; the church organization is their work, and perhaps the most splendid monument of Italian genius, greater even than the Roman Empire; and they will probably be unwilling to have it carried through the present crisis by other than Italian hands.

There is no doubt that at this writing the relations between Russia and England have passed into a phase of such delicacy that a very slight indiscretion on either side may bring on war. Great excitement was produced in England towards the close of last week by the news that the Russians had entered Constantinople, and it removed the Liberal opposition to the vote for the army and navy and produced a good deal of warlike frenzy in the London mob, and led to the breaking of Mr. Gladstone's windows and those of the *Daily News*. What had really happened was that the Russians had occupied the Turkish line of defences across the peninsula, at Tchadallye, seventeen miles from the capital, so that during the negotiations they were to have the city at their mercy. This really made little difference, as the Turks had no army to hold the line, and the defeat of Suleiman Pasha was virtually equivalent to the fall of the city; but it was accompanied by great reticence on the part of the Russian Government as to the terms of the armistice, and was followed by an intimation from Prince Gortchakoff to the British minister at St. Petersburg that the terms concerned nobody but the belligerents. What was worse still was that news came from Adrianople which made it very plain that Turkey had determined on a total change of policy, had thrown England overboard, and was likely to enter into a close alliance with Russia. On this the fleet was ordered to Constantinople "to protect the life and property of the Christians," and the Sultan was asked for a firman to open the Dardanelles, which was at first refused on the ground that if the fleet came up the Russians would enter the city, but has probably been by this time conceded. St. Petersburg despatches say that this contingency has been provided for in the Russian instructions to the generals commanding in the field, and that if the British fleet comes up the army will occupy the city and receive the British Admiral with great cordiality. This is the situation which at this writing seems likely to be created before the end of the week. The fleet and army will then be face to face, both in a state of considerable irritation, and each with an enraged public at home egging it on; and the slightest misunderstanding on the spot may bring on war.

That Russia has acted with an appearance of sharpness in the matter there is no question. The Emperor pledged himself that he would not occupy Constantinople, except as a military necessity, in order to compel the Turks to submit. The Turks having submitted while the invading army was still north of Adrianople, it was doubtless expected in London that it would come no further southward, but that peace would be made at Adrianople. The Grand Duke, however, took a broader view of the matter, and concluding, not unreasonably, that the cutting off and defeat of Suleiman's army virtually put the capital at his mercy, determined to get within reach of it before he began to negotiate, so as to preclude the Turks from organizing any fresh resistance behind the fortified lines. While, therefore, he received the envoys at Kezanlik with great courtesy, and began talking peace with them, he carried them gently along with him on his march southward, and managed not to have the armistice concluded until he had reached Tchadallye, at the same time sending very meagre information to St. Petersburg of what he was doing, lest he might be interfered with. This is all, undoubtedly a little sharp, but it is what might have been expected and what any other Power would have done under the circumstances. The political crisis it has brought on in London is little short of ludicrous. It appears to have been expected that Russia, at the close of a bloody war, in which she has lost 100,000 men and disordered her finances, would, after having brought the Turk to his knees, be as moderate and conciliatory and as careful of all collateral interests as she was at the Conference in Constantinople last year, and be ready to take England into partnership on equal terms and to submit the terms of peace to her for revision. There appears, too, to be a strong belief in England that the fleet can blow Russia out of Turkey, especially now that the Danubian fortresses, Widdin, Rustchuk, Belgradshik, and Silistria, are in her hands. If any Power can compel her to retire it is Austria, but Austria will not fight for a trifle, and will certainly not fight for "British interests."

THE DESTRUCTION OF CONFIDENCE BY THE SILVER MOVEMENT.

THE great and, within the last three months, increasing number of failures both of individuals and of banks and other moneyed corporations, following on four years of deep depression and wide-spread financial disaster, would of itself be sufficient to make the return of better times slow and difficult. For the thing which brings back "good times," and keeps them good, is confidence, and confidence means the belief of those who have money not only that it is secure in their hands to-day, but that they may part with it by loan or investment with a reasonable certainty that in one, five, or ten years they will receive back what they gave and enjoy a fair profit on its use in the interval. In no country in the world has this confidence existed in so high a degree during the last sixty years as in this, and in no country has it produced such wonderful prosperity. Nothing like the natural progress of the United States since the beginning of the present century has ever been recorded in industrial history, and this progress has not been due simply, or even principally, to richness of natural resources or wideness of area. The soil is as rich in all ways in Mexico and South America, and in Russia, as here; the climate is as salubrious, and the area open to agriculture for all practical purposes as large. But for want of the last and greatest of all blessings, the blessing of security for savings against vexation or spoliation whether by legal or illegal means, no other nation, however gifted by nature, has grown as this nation. In no other has that splendid confidence in the future which we call "energy and enterprise" been developed in so high a degree; to no other shores has there been that flocking of the most industrious and adventurous spirits of every nationality, which has made the records of American immigration so marvellous a story. There have been plenty of financial disasters within the last eighty years, it is true. There have been "hard times" before now, and the recovery after the collapse of 1837 was very slow; but our present trouble differs from all crises which have preceded it in this, that the standard of value has never in any other been dragged into the political arena, and made the football of political parties. There have been various kinds of currency afloat since the Revolution, good, bad, and indifferent, but behind them all there lay gold and silver coin of steady purchasing power, which nobody thought of meddling with for political purposes, and by which the industry of the country readjusted itself after the various forms of paper inflation had failed.

The trifling changes which have been made in the coinage since 1792 have been made until now by experts, with reference simply to the proper supply of small change and the maintenance of durable monetary relations with other countries. That Congress could meddle with the standard of value, or exercise any discretion in the creation of legal tender, for political convenience, or the convenience of any particular class of the community, was something never dreamed of until the outbreak of the war. Indeed it seems a fair question whether, as suggested by our correspondent, Mr. Sterne, on another page, the power of deciding whether gold and silver should be the unit of value was not reserved to the States by the Constitution, and whether Congress has any right to meddle with the standard at all—whether its function is not confined to coining money and fixing the value of the different coins *in relation to each other*. Taken in any other sense the Constitution would give Congress the right to fix the purchasing power of money—or, in other words, to say how much of any other commodities a particular coin is worth, which is absurd. The "value" of a coin means its value in other coins. The notion that Congress could control the standard of value and make anything it pleased a legal tender came in during the agony and peril of the civil war, and served its purpose at the time; but no man who looks into our financial history since then, and who examines intelligently the situation in which we are now placed, can help regarding it as one of the greatest calamities which ever befell a commercial community, and as likely to give confidence a blow from which it will not recover for many years, and which may permanently diminish our rate of material growth. Between 1865 and 1872 the chance of escape from it offered itself by a rapid funding and redemption of the greenbacks while they were still popularly regarded as promissory notes, and before the politicians had begun to perceive fully the use which might be made of the power of issuing them. That great opportunity was allowed to slip by, owing to General Grant's having put in charge of the Treasury at this most critical moment a very ignorant politician, who wasted precious millions, and years more precious still, in redeeming bonds not due. From the consequences of that mistake, which it is no exaggeration to call frightful, we are now suffering. The standard of value has got down into the political arena, and a question which is almost as delicate and almost as independent of legislation as a mathematical problem, and which is fit to be dealt with by nobody but experts, is being decided by a count of noses, has become a text for all the demagogues in the country, and has filled the minds of millions of the needy and unthinking with the possibility of vast improvements in their condition by legislative money tricks. This situation is grave, and the issue from it is not easy to foresee; but the first step towards escape is to be found in a clear perception of its gravity on the part of the intelligent and industrious, and a clear recognition of the fact that it is unprecedented; that, therefore, the complacent optimism which says we shall get out of this scrape as easily as we have got out of others like it before, is no longer warrantable. We have never been in any scrape like this before.

The possibilities with which it is filling the popular imagination in some parts of the country have produced a kind of insanity in which demagogues are revelling. It has, all accounts agree, ceased to be of any use to argue with the silver-men; the very facts which to the rational and sober-minded portion of the community furnish the strongest argument against the performances with which Congress is threatening us, are to them arguments in their favor. The hostility of all the merchants and bankers and solvent traders to the Bland Bill they regard not as the judgment of competent critics, but as the natural dismay of a parcel of tricksters and gamblers at the prospect of having to disgorge and make compensation to their victims. The rapidly-multiplying failures they treat not as signs that the bill will prove mischievous, but as proofs that it should be passed as speedily as possible. The rapid return of United States bonds from Europe and their fall in the foreign markets they jeer at as devices of the "Money Power" to secure the fruits of its conspiracy in 1873 and defeat the great popular effort to undo its work. In fact, the ordinary weapons of persuasion are at this moment as powerless with the majority in Congress and at the West as they would be in a lunatic asylum, or as they were during the madness of 1792 or of 1871 in Paris. When General Trochu refrained during the siege from sending the National Guard to attack the Germans outside, they said the "*grédin*" was in league with the enemy, and did not like to let loose the only force which meant fighting. When at last he sent them out and they got a sound thrashing, they said the villain had sent them out because he loved to see "the people" slaughtered. In like manner, everything which now happens is to the silver-men a trick of the "goldites"; if silver is scarce, it is the result of their "plot"; if it grows too plentiful, it is the result of their spite and malice. In fact, those who are charged with the discussion of this question would be fairly justified in throwing down their arms, and pronouncing discussion useless. It is apparently the doctor rather than the logician or economist who is now needed.

There are some reasons for fearing that out of this weariness and despair further mischief may result if they produce anything like acquiescence. Some of the supporters of sound currency in the press—the Cincinnati *Gazette*, for instance—are already preparing for total surrender, by saying that this is a people's government, and that if the people decide to remonetize silver, the only thing to be done is to accept their decision and do our best to make

the silver standard a success. It is in this spirit that our greatest danger now lies. The silver movement cannot be made successful by your exertions, brethren. The standard of value is not a question of taste, or philanthropy, or majorities. It is something which neither legislation, nor heroism, nor patriotism can reach. There is, therefore, no use in your "bowing to the popular will" about it. You might as well bow to the popular will about the properties of the circle. If "the people" could settle this question there never would have been any good reason for opposing the silver movement, or any attempt to doctor the currency, for all that would be needed to justify any expedient and make it succeed would be a popular majority in its favor. If we remonetize silver, we shall lose our stock of gold and be deluged with French and German silver, no matter how pious we are; if we pay our bonds or interest in silver we shall lose our credit for a century, no matter what the people say or think. If we part with our gold, as Mr. Belmont showed in his excellent letter the other day, the hope of creating the double standard by concert with the European Powers, the only feasible mode of doing it, will be destroyed, for we shall not have the means of resorting to it.

Moreover, we must not suppose that by accepting the Bland Bill, and making the best of it, we shall satisfy the silver fanatics. On the contrary, there is every reason for believing that we shall embolden them to try other experiments of the same sort. The silver movement began with rational bi-metallists; it has been ever since passing more and more into the hands of extreme men who are burdened with no financial theories whatever, and whose ultimate aim is repudiation and unlimited government money of some sort; and any sign of submission will give this class more and more strength and enterprise, and spread the poison of communism, already very rife, further through the ranks of the workingmen. In addition to this, too, it will probably take a year or two to demonstrate fully the folly of the measure. These two years will be years of alarm and uncertainty and commercial disaster, and before they are passed the timidity of capital will have increased, the reluctance to embark in any new enterprise or to lend money will have spread, and we shall have to try the next experiment in the midst of a paralysis and confusion of which our present condition gives but a slight idea. What wisdom calls for now is that we shall resist still, and to the utmost, at every stage. If the bill is passed over the President's veto, or he should be captivated by any of the "compromises" now offered, such as Mr. Blaine's or Mr. Christiancy's, every effort should be made to localize the folly by State legislation. The sane States, which contain the capital of the country and most of its manufacturing industry, such as New England, New York, and Pennsylvania, should legislate promptly, making gold exclusively the standard of value, and, if thought desirable, making silver a legal tender at its bullion value in gold. This would meet the lunatics and criminals with the only argument which lunatics and criminals understand—the argument of impossibility. It would save the business of the country from a prodigious aggravation of the existing disorder, and would cause a restoration of confidence, by removing that dread of the wild-cat majorities in Congress which is now so fatal to all enterprise.

PIUS THE NINTH.

THE death of Pius IX. has produced more sensation than that of any of his predecessors in modern times, partly owing to the length of his reign, which of itself gave him a certain pre-eminence over them, but mainly owing to the trials through which the Papacy has passed under his rule. Pius VII. excited a good deal more sympathy throughout Europe, and undoubtedly played the *rôle* of a martyr with more dignity and patience; but then this sympathy was largely made up of hatred of Napoleon. Outside the comparatively small politico-religious sect known as "Ultramontanes," the sufferings of Pius IX. have called out nothing that can be called commiseration. His fulminations, too, against the "sub-Alpine monarch," as he called Victor Emmanuel, for despoiling him of the patrimony of the Church, have been deprived of all weight by the belief, which has long been widely diffused among those who were most interested in Papal matters, that these fulminations were purely official; that privately the Pope esteemed Victor Emmanuel; and that he had retained through all the stormy years which had elapsed since he himself first roused the enthusiasm of the Italian Liberals, in 1848, a soft place in his heart for the gallant king who had at last rid Italian soil of foreign rulers—who had, in short, accomplished the work which he, in the first moments of his pontificate, had dreamed that, priest as he was, he might share. It may be fairly questioned, too, whether his abandonment of the Liberal cause in 1848 was not an absolute necessity of his position—whether, defended as it was then, it was possible for anybody who was *ex-officio* conservative to help it; for it must be admitted that, legitimate as was the great uprising of that year, and ripe for it as Europe was, the materials for success of any kind did not exist in the Liberal ranks. The leaders of the movement in every country were mostly either conspirators embittered by persecution, or speculative philosophers who had dreamed so much as to have lost their sense of the possible. In Italy, in Germany, and in France the situation was essentially the same. The popular movement was headed by half-crazed zealots, of whom the military men took easy reckoning as soon as they had recovered from their first surprise, and at whose head a High-Priest professing to represent the most stable of all institutions, and to speak with the voice of indisputable Authority, would have cut a figure almost farcical. It is not to Pio Nono's discredit that he should have quickly recognized his mistake, but there are many reasons for believing that he never wholly cast out the noble aspiration which led him into it, and that the booming of the Italian guns at Palestro and Custozza rekindled in the old man's breast the smouldering fire of the earlier days.

His prolonged and, considering everything, remarkably successful efforts to strengthen the purely spiritual authority of the Papacy look, now that the amazement they at first excited is over, like a recognition on his part of the fact that the temporal power was soon to leave him, and that as a purely spiritual chief he might make demands on the faith and obedience of believers which, when trammelled with responsibilities of a grossly misgoverned principality, he could not decently put forward. The French occupation he must have recognized as a mere preface to his final overthrow as a secular potentate. It left his rule a mere name; and the presence of the king at Florence was a sure sign that he was really on his way to Rome, and that the union of Italy under one head was not only inevitable but near. Mad as the performances of the Vatican Council seemed at the time, would anybody pass the same judgment on them now that he did then? The authority it claimed for the Church and its earthly head then certainly appeared monstrous, not because its propositions were any more abstruse or indigestible than many others already firmly embedded in the body of Roman theology, but because it was supposed that the Catholic mind was no longer as receptive towards dogma as it once was, and that the promulgation of fresh and startling truths would too severely strain the faith of the faithful. It certainly seems now as if the Pope in this matter had been wiser than his critics. The dissent and insubordination which showed themselves immediately after the Council, and which then seemed so formidable, have almost faded out of sight. The Old-Catholic movement, from which so much was expected, has come to nothing. When such leaders as Dr. Döllinger and Bishop Reinkens—already old men—disappear, it is probable we shall never hear much more of their following. On the other hand, as far as the rest of the Church is concerned, the infallibility proclamation has acted very much like the successful quelling of a mutiny or an insubordinate army. It has broken in the clergy and the laity to a submission and discipline they have never known before. It has made resistance of any kind to Papal authority look more hopeless than it has ever looked before. It has completely extirpated all the traditions of the national churches, and converted the Papacy into a true spiritual Cæsarism, whose law-making power no man disputes any longer.

It is true, doubtless, that the success of the Ultramontanes has been due in a measure to the existence of a state of things which at first sight seems unfavorable to all spiritual authority. The Old Catholics have failed not because the world is more disposed now than ever to submit to prelatical pretensions, but because the indifference about dogma is very great, and the hostility to it not strong enough to make men take much trouble to display it. In Luther's day, when a man revolted against the church he was bred in, he could not be satisfied without setting up another. In ours he does not care enough about the matter to supply himself with a new organization. He simply goes his way, keeps his belief to himself, and if there is no church to suit him he connects himself with none. The prevalence of this lukewarmness takes the life out of all dissent, and makes the promulgation of new doctrines comparatively easy. On the other hand, the really earnest and sincere believers, who in other days would have had a sore struggle in accepting anything so strange and non-rational as the Pope's infallibility—that is, the large body of Christians who are ready enough to inherit articles of faith, however strange, but do not like adding to the number themselves—are in our time too much troubled about the whole fabric of belief to care much about any alterations in it that do not seem to imperil it. They are frightened by Materialism, frightened by the assaults made not on the Catholic Church only, but on all faith in the supernatural and invisible, and shrink back with horror from the world which modern Science seems to offer them, in which Memory would seem an encumbrance, Hope would have nothing to feed on, and Love itself become the seed of useless pain. To these—and they are a great host—the pretensions, however exorbitant, of any institution which seems to stand for and maintain the connection between the visible and invisible world, and to guarantee man's immortality, are readily forgiven, even if they are not applauded. They are a host, too, whose ranks will be easily and largely recruited as long as bread is won in bitterness and sorrow, and in every human life "the sweet bells of morning" cease to ring at noon.

The Pope was perhaps, therefore, more a man of his time than he seemed to most of us ten years ago, and yet he was the last and greatest relic of the Middle Ages. We shall never again see a compound of the priest and king, or the strange spectacle which he, good and gentle as he was, afforded us of earthly battalions in the pay of Christ's representative raking his enemies with repeating rifles, and sacking towns *ad majorem Dei gloriam*. Perugia and Monte Rotondo left "damned spots" on the Pope's white hands which all the waters of Jordan could not wash out, and yet they were but projections into modern society of ideas which fifteen centuries of theological cultivation of morals had sanctioned, and which to the whole Catholic world to-day have nothing strange or shocking in them. Fifty years hence they will seem as atrocious as heretic-burning, and our descendants will be reading of the temporal papacy as we now read of the Order of St. John or of the Knights Templars. The death of Victor Emmanuel and of the Pope and the dismemberment of Turkey in the same year may be said to mark the close of an era. With them the Old Europe left by the treaties of 1815 has finally passed away, and a new Europe with new problems to solve and new forces at work, both social and religious, has taken its place. As we see it, those of us who can recall the Europe of 1848, in which both Pio Nono and Victor Emmanuel first appeared on the scene, must acknowledge that the gains of the thirty years have been very great. It is not only that new states have arisen on the ruins of mediæval despotisms, but that the friends of progress have been sobered and disciplined by experience. Those who now long for better things see with clearer eyes and labor with steadier hands. It is pleasant to remember this when one recalls the vast and flaming battle-fields on which the old régime passed away. It is pleasant to remember that the year which witnesses the death of the last temporal Pope and of the first King of Italy will probably witness also the final extirpation of Asiatic rule on European soil.

THE CONSTITUTIONAL AMENDMENT ON CITY GOVERNMENT.

THE last Legislature passed the Amendment to the Constitution providing a general plan of municipal government for the cities of this State. It has to be passed by the present Legislature also, in order to be prepared for submission to the people at the next election, and at this writing it seems likely that the present Legislature will not pass it. The amendment may be said to have met with the approval of all that portion of the community which really desires to see city government improved, except as regards the fifth section, which provides for the election of a Board of Finance by taxpayers exclusively. The well-meaning who object to this do so either on the ground that this restriction of the suffrage would not raise the character of the board, or on the ground that, whether it would or not, no amendment with this restriction on it has any chance of adoption by the people. To meet the views of this class it has been proposed and advocated by Mr. Bradford Prince that the suffrage section shall be submitted as a separate amendment, so that it may be voted on without endangering the remainder, which is acknowledged to contain valuable features. But certain members of the bar, belonging to the Committee of Fifty organized for the support of the amendment as reported by the Commission, have written an opinion, in which Judge Comstock concurs, that this Legislature has no power to break up the amendment and submit it in parts; that it must submit it as it received it from its predecessor, and that any such change as is proposed would make it a new and different one, which, in its turn, would have to receive the approval of two Legislatures before being voted on by the people. It may be taken for granted, therefore, that it will either be submitted as it is, or be allowed to drop.

It is easy to understand why the Legislature should be unwilling itself to embody it in the Constitution, if it had the power to do so; why it should be unwilling to submit it to a popular vote is tolerably hard for the ordinary mind to comprehend. All those who think the suffrage section ought not to be adopted, no matter for what reason, are, as far as our observation goes, sure that it will not be adopted, so that the submission would be to them at worst nothing more than an act of common courtesy to the very large and respectable body of citizens who believe in it, and to the Commission which gave a good deal of time and labor to framing it. The only thing that its opponents can possibly fear from the submission, therefore, is that it would pain the people to be asked to vote on anything of the kind. But is not this taking a very superfine and wholly unreal view of popular susceptibilities? Nobody who knows the people of this State really supposes that their feelings would be hurt by being asked to cast their ballots about anything not frivolous or ridiculous. On the contrary, if the proposal of the Commission be as offensive to the popular feeling as many politicians think it is, the voters will be glad to have a chance of formally stamping it with their disapproval, and in this way the matter would be finally set at rest and the responsibility of rejecting the plan of the Commission placed on the only shoulders competent or authorized to assume it. For we have no hesitation in saying that, considering the increasing gravity of the problem of city government in this State, nobody but the people at large ought to venture to reject any well-considered and properly authorized attempt to solve it. It is not claiming too much for the report of the Commission to say that it is such an attempt. What the people think about the matter is something on which the wisest and shrewdest politicians may be mistaken; we know what blunders this class occasionally make as to the drift of popular sentiment. When the popular judgment can be so readily had, it seems unreasonable and unwarrantable to refuse to ask for it, particularly when, if obtained, it might serve as a useful guide in subsequent efforts to provide our cities with a better government.

The report of the Commission shows beyond dispute that the proposed mode of electing the Board of Finance is no innovation; that the principle on which it is based has long been recognized in

the government of the smaller municipalities of the State. We have drawn attention in these columns to the various devices adopted in all the charter legislation of the last twenty years, such as commissions and boards of apportionment, to withdraw the city funds in whole or in part from the control of universal suffrage; or, in other words, to do covertly or by indirection what the amendment proposes to do openly. The arguments, therefore, which have been most freely used against it, that it is an innovation and that it would deprive a large body of voters of rights they now enjoy, may fairly be pronounced worthless. They are refuted by notorious facts. What this portion of the plan of the Commission seeks to accomplish, and all that it would accomplish if it succeeded, is the creation of a better body than now exists for the supervision of city expenditures. It would, in other words, if it answered the expectations of its authors, put the city treasury in the keeping of a board of citizens of character and repute, place it out of the reach of the General Committee of Tammany Hall, which is probably the most discreditable organization which has ever controlled the government of a civilized community, and is about as much influenced by universal suffrage or by public opinion as King Koffee Kalkalli.

There are two good results which the adoption of the Amendment *without* the restricted suffrage would bring about, and two only. It would put a stop to charter-tinkering at Albany and to the annual interference of the Legislature with city affairs, and might possibly thus increase the sense of responsibility of the citizens themselves with regard to municipal business. It would also stop the practice of running in debt for the current expenses of the city government. That these would be important gains we do not deny, but they might be achieved and leave the fundamental evil of municipal affairs still untouched—viz., the levying of enormous taxes, to be expended by a low class of officials in a wasteful and corrupt manner. The leading misfortune of New York to-day is essentially the same as that under which it labored twenty years ago—viz., that vast sums of money are levied from the citizens for which no adequate return is made. The streets are not properly cleaned or paved or policed; the administration of justice in its lower branches is ignorant and corrupt; the whole government is honeycombed with sinecures and jobbery, and the public works are used for the reward of party services. The Tweed Ring did not create these evils; it merely aggravated them rapidly. The Constitutional Amendment, if shorn of the suffrage section, would not cure them, and for the simple reason that a board of Finance such as the Amendment provides for, elected by universal suffrage—that is, by the constituency which elects the present city government—would be in no respect superior to the late Board of Supervisors or the present Board of Aldermen. Why should it? Its members would be nominated in precisely the same way, and its powers would be so great that the eagerness of the class of persons who now control the city government to get hold of it would be unconquerable. It would become, in short, from the very first a ring of jobbers drawn from both parties, like the old Board of Supervisors, probably most of them men without property, and animated by that contempt for property-holders which seems to be the latest fashion among American demagogues; and, worse still, it would be embedded in the Constitution.

The one hope of salvation for the city lies in bringing home to the bulk of the voters two things—first, that they are taxpayers, and, secondly, that municipal affairs are business affairs, to be managed on business principles. The election of a Board of Finance by universal suffrage will not do this. It will bring no new sentiment or idea or influence to bear on city affairs. It will not create or foster any new way of looking at them. It will not bring home to the resident workingman that he is any more interested in the proper conduct of municipal business than any tramp who begs by day and sleeps in the station-house at night. It will simply be a rearrangement of the old materials of the kind which is attempted at Albany every winter, with the difference that this one would be permanent. The plan of the Commission, perhaps, would not produce any improvement; it may be that the evils of government in a city peopled as New York is are ineradicable; but it is quite certain, or certain as anything can be in politics, that creating a new Board, differing from the Board of Supervisors mainly in name, will make no essential change in the situation.

The flippant demagogy of the Democratic speeches against the suffrage section of the amendment is brought into bold relief by the universal satisfaction with which the withdrawal of the prisons and canals from government by popular election is hailed by all parties. What is this but a practical and sensible recognition by the people of the State that there were some important places which universal suffrage is not fitted to fill directly? Why is there no mourning over the loss by "hundreds and thousands of estimable citizens, clerks, artisans, and young professional men," of all voice in the management of our prisons and great public works? Why should great cities be given up to the dominion of sentimentalists and idealogues any more than the penitentiaries and the canals?

WASHINGTON GOSSIP.

WASHINGTON, February 11, 1878.

THE debate on the Bland Silver Bill has reached the languishing point, so that one begins to hear people say that it will not amount to much whether it passes or not. Its supporters generally acknowledge that it will not relieve the existing commercial distress, and its opponents (many of them) say that, while it is a bad thing, the country will somehow survive it—business will put itself upon a gold basis in spite of silver legislation, and the present worshippers of the "dollar of the fathers" will be so disgusted with their idol after they get it that within three years they will banish it to the uttermost parts of the earth and call for greenbacks instead. The "green goddess of irredeemable paper," as the late Mr. Vallandigham was wont to call it, is the real object of adoration among the silver-men. The report of the Silver Commission itself is an undisguised plea for "fiat money," to be issued on a *per capita* basis. The Ohio inflationists, a few years ago, called for an issue of paper money equal to "the wants of trade." Senator Jones proposes that it be made equal to the census, which is still more vague; and that is what the bulk of his followers are after. I met one of them yesterday. He is a member of Congress. He is wild of eye, honest of purpose, restless of motion, and mad as a March hare. He knows just enough of political economy to be dangerous to himself and others, and he can retail till the crack of doom the theories of "fiat money" which Senator Jones and the Hon. Mr. Bland have furnished in a "job lot" in the pages of their mischievous report. I beg the merchants, bankers, manufacturers, and all citizens who have anything to lose to beware of this disguised legion, who are pushing the Silver Bill only to gain new vantage-ground for greenbacks. They will be just as much opposed to specie resumption after silver is remonetized as before. They want no metallic money whatever, and no metallic basis whatever. Their strength, fortunately, is not so great as that of the Silver Bill itself, which counts among its advocates a great variety of misinformation, thoroughly honest and well-grounded in the belief that specie is a desirable feature of a permanent currency. Nevertheless, the danger will be ever present, till gold resumption is reached, that these madcaps may get possession of the Government long enough to work their theories upon the American people, and for this reason the earliest opportunity should be embraced by every man and corporation to put his or its business upon the basis prevailing in the commercial world. This is not a difficult thing to do at present, and, if the Bland Bill becomes a law in the shape given to it by the Senate Finance Committee—*i. e.*, with the free-coinage clause stricken out—there will be two or three years, while the mints are running on silver, within which this voluntary change may be effected.

I remarked that the silver debate has reached the languishing point. There are signs of weariness and of a desire for change on both sides; yet the demon of bankruptcy and threatened bankruptcy continues to lash an unwilling Congress forward to an act which a majority of members deem unwise, and which they would like to find some excuse to avoid. There can be no doubt that large and important sections of the country are crazy on this subject, and that they will continue so until a revival of business takes place, or until they get the "dollar of the fathers" and find it does them no good. Among the opponents of the bill one frequently hears it said that, but for the disastrous blow to the public credit, it would perhaps be wise and statesmanlike to let the silver-maniacs have their way, free coinage and all, in order that they might by experiment get

all such nonsense out of their heads for all future time. The fact that the public credit is inseparably linked with the measure frustrates this benevolent design, and keeps the President up to the mark (as I am fully persuaded) of vetoing the bill on its first passage. Whether it can be passed over a veto, is the standing conundrum of Washington City; but I am inclined to think it cannot. The next step of the silver-men will be to make silver legal tender to the same extent that greenbacks are. This would be equivalent to a repeal of the date of resumption, as it would precipitate a run on the Treasury for gold on the first of January next, and would cause every outstanding greenback to be presented for redemption in order to get the premium of gold over silver before the new silver dollars could be coined. Of course the Treasury, with $100,000,000 or less of gold, could not expose itself to a draft of over $300,000,000, stimulated by the temptation of 9 per cent. premium. It must necessarily refuse to execute the Resumption Act.

The silver discussion has temporarily withdrawn attention from the President's attitude to the Republican party, or, rather, to the Republican majority in the Senate. The conviction of Anderson and the imprisonment of Wells at New Orleans have, however, fallen like a bomb-shell in the ranks of the "visiting statesmen," and much uneasiness has been manifested in high quarters. It is generally believed that Wells will be convicted also, and that both culprits will be sent to the penitentiary. This movement, so far as one can judge from the conversation of Southern politicians, has no bearing upon the validity of the President's title, but is intended to make the alteration of election returns a costly and reprehensible trade hereafter. Nevertheless, it has stirred up many smouldering fires, and it may possibly have the effect to bring the President "into harmony" with the Republican Senators for the purpose of common defence. Such harmony would imply the abandonment of civil-service reform, the surrender of appointments to Congressmen after the old method, and a re-establishment of the "machine," which has been considerably disabled since the 4th of March last. It is not likely, however, that Wells and Anderson have any disclosures to make which will injuriously affect the President or any member of his Cabinet; for, although Secretary Sherman was among the "visiting statesmen," and may be considered their chief, he is too sagacious to leave any footprints in the company of felons. When the doors of the penitentiary close on Wells and Anderson, and the New Orleans Custom-house loses their valuable services, it will make little difference what they say by way of inculpating others, unless they can produce contracts in writing, bills of exchange, or other instruments capable of being identified. It may be safely assumed that they have nothing to show except the fact that they have been retained in important Federal offices.

The visit of Gen. Bristow to this city on the President's invitation, and the state dinner given in his honor, have no significance beyond what appears upon the surface. They do not imply that Mr. Bristow is to be offered a seat in the Cabinet, or that he is to be the Administration candidate for the next Presidency. What does appear upon the surface is the fact that the President regrets having given heed to the request of the ex-President that he should never recognize Bristow in any way, a request which was not responded to at the time it was made, but which, nevertheless, seems to have produced some impression.

The lobbying forces of the several Pacific Railroads are collecting in formidable array. The most numerous are those of the Union and Central Pacific, whose common object is called a settlement with the Government on the score of the subsidy bonds, but might more properly be styled a plan of compromise offered by a solvent debtor to obtain the profits, without incurring the risks, of fraudulent bankruptcy. The Texas and Pacific subsidy is already slain to all intents and purposes, and if its friends will now join in requiring payment in full of the other subsidy, there will be a new and notable illustration of the proverb that when rogues fall out honest men get their dues.

THE WIFE OF CHARLES I. OF ENGLAND.

PARIS, January 25, 1878.

HENRIETTA-MARIA of France, Queen of England, is chiefly known to the present generation in her own country through the eloquent funeral oration of Bossuet. As long as the French language endures, and even if it ever becomes a dead language, the famous exordium of this oration will be remembered. "He who reigns in heaven, and on whom depend all empires, to whom alone belong glory, majesty, and independence, can alone glory in dictating laws to kings and in giving them, when he chooses, great and terrible lessons, etc. . . ." But a religious sermon, even on the death of a woman who was daughter, wife, and mother of kings, can hardly be looked upon as an historical document. The oration of Bossuet really tells us more about the spirit of the seventeenth century in France than about Henrietta-Maria. The good Madame de Motteville speaks occasionally of her. I found long ago in the wooden boxes of the Quai Voltaire a book with this title: 'Histoire de très-haute et très-puissante Princesse Henriette Marie de France, Reyne de la Grand' Bretagne, avec un Journal de sa vie,' without any author's name; but I have ascertained that this book, published in 1694, is the work of a priest, Father Cotolendi. It is chiefly a homage to the religious sentiments of Henrietta-Maria and an account of her life after her return to France. In England we must cite the 'Lives of the Queens of England,' by Miss Agnes Strickland, and the 'Letters of Henrietta-Maria,' published by Mrs. Anne Everett Green. These letters are translations from the French, and Comte de Baillon gives us now for the first time their original text in a new work on Henrietta-Maria. Mrs. Green discovered these letters in the British Museum. She found there a manuscript containing copies of letters made by a person who evidently hardly knew the French language. The letters had been transcribed without any order, without any regard for the dates, nor even for the unity of each letter. Many letters, which covered several sheets, had been divided without any reference to the end or to the beginning of the phrases. The names had been replaced by pseudonyms. The copies had evidently been made by order of the queen, and the names of her best friends had been changed into those of Pym, Hampden, Essex, etc., so as to deceive the persons who might have found them.

Henrietta and Charles I. had a common cipher. The queen wrote her letters to her husband in French, and she herself made the translation in cipher, when she did not confide this care to Lord Jermyn. When Charles received the letters the cipher helped to restore the original French. The king himself always answered in English. Count Baillon does full justice to the skill with which Mrs. Green reconstituted the original letters of the queen. He has added to the previous collection of these letters in the Harleian collection copies of many letters written from 1625 to 1660, and found in the archives and collections of London, of Paris, and of St. Petersburg. He has used also a manuscript of the memoirs of Father Cyprien de Gamaches, one of the queen's almoners, who never left her for many years.

The first letter of M. de Baillon's collection is significant enough (it is in manuscript at the National Library of Paris). It is addressed to Louis XIII. on the 6th April, 1625. Henrietta thanks the King of France for his good offices in arranging her marriage with the Prince of Wales, and adds: "I give your majesty my word and my faith, in conscience, that if it pleases God to bless this marriage, and if he gives me the grace of having children, I will make no choice in order to educate and wait upon these children except of Catholic persons." She takes the same engagement in a letter addressed on the same day to Pope Urban VIII. It is well known that the Duke of Buckingham came to France to accompany the young queen to her kingdom, and that Marie de Médicis accompanied her daughter to Amiens, where she fell dangerously ill. When she recovered, the queen mother took leave of her daughter and gave her secret instructions which had been prepared by Father Bérulle, and which are kept in copy in the French archives. These instructions are chiefly religious: "Thank God every day that you are Christian and Catholic. . . . You are a descendant of St. Louis. . . . Be firm in the religion in which you have been born, for the defence of which the saint, your ancestor, exposed his life, and died among the infidels. . . . You have received, for the sake of the Holy Virgin, the name of Mary. . . . You belong to God; be always wholly his."

These first letters, these instructions, give us, so to speak, the key to Henrietta's life. Her devotion to her native country, the associations of early life, the memories of the past, all combined to estrange her from a country where she was almost immediately surrounded with enemies. She had the tenacity of her mother, and she had not inherited the elasticity and the intelligence of her father. Religion was always to her more important than politics; it would be perhaps more just to say that she only looked on politics through a religious veil. The queen refused to appear at the ceremony of the coronation on the 7th February, 1626, because she would take no part in an Anglican ceremony, and M. de Baillon is probably right when he says that from that moment she was considered as a mere foreigner, and that the English people deeply resented what it considered a mark of contempt. The Duke of Buckingham inflamed Charles against the French-followers of Henrietta, and on the 7th August, 1626, Charles wrote this letter, so unworthy of a

king: "Steenie: I have received your letter by Dick Graham. This is my answer: I command you to send all the French away to-morrow out of the town, if you can by fair means, but stick not long in disputing; otherwise force them away, driving them away like so many wild beasts, until you have shipped them away, and so the devil go with them." The French followers of the queen were expelled from Somerset House in the most brutal manner. A man threw a stone at the head of the handsome Madame de St. Georges (one of the queen's favorite correspondents, whom she always calls Mamie Saint Georges), but fortunately did not wound her. Henrietta, separated from her French household, considered herself almost in exile. Bassompierre—the famous and handsome Bassompierre—was sent by Louis XIII. to the English court; the details of his mission must be read in his 'Ambassades.' His instructions obliged him to try to effect a reconciliation between Charles and the queen, and he was constantly opposed in his object by Buckingham.

Henrietta was happier after the death of the king's favorite; for eighteen years, says Madame de Motteville, she was "happy as wife, as mother, and as queen." The history of her later misfortunes is well known; in her long conversations with Madame de Motteville, Henrietta-Maria always attributed the fatal issue of the duel between Charles and the Parliament to the betrayal of the Countess of Carlisle. When Charles had resolved to arrest the "five members," he told his secret to his wife. Before going in person to Parliament he embraced her, and said to her: "If in one hour precisely you have no bad news, you will see me again stronger and more powerful than ever." He then left with a hundred gentlemen, and lost some time on his way receiving petitions from various people. Meanwhile, the queen was closeted with Lady Carlisle; after a while she imprudently said to her: "At the present moment the king is, I trust, the master in his own realm, and such and such men (naming the five members) are arrested." The countess left the apartment, wrote a letter to Pym, and sent it in haste. The king was already approaching the house of Parliament with his guards; Pym, however, received the letter in time, and he and the threatened members left before the entrance of the king. Speaking of Charles I., the queen assured Madame de Motteville long afterwards: "I have lost him by my own fault." Henrietta left England for Holland on the 23d of February, 1642. Civil war soon began, and the letters of that period written by the king and his wife became valuable historical documents. The daughter of Henri IV. could write to her husband: "Walk straight on and God will help you; if you do not take care of those who suffer for you you are lost, and if you forget them it is such a vile action that I am sure it cannot come from you. Beware of yourself, as those who speak to you with boldness are generally right in your eyes."

Madame de Motteville will always be the best authority with regard to Henrietta-Maria. You will find in the book of the Comte de Baillon the account of the scene which took place when the news of the execution of Charles I. was broken to her at the Louvre; but the venerable Father Cyprien de Gamaches writes in that peculiar religious style which envelops all human events and affairs in the same solemn generalities. Motteville is simple and more lively. She goes to see Henrietta in the monastery of the Carmelites in the Faubourg Saint Jacques, where the unfortunate widow had found a momentary asylum; she asks her if she has any message for the royal family: "As soon as she saw me she asked me to kneel by the side of her bed, gave me her hand, and with a hundred sobs which interrupted her speech, she besought me to inform the queen of her state, and to tell her that the king her lord, whose death was making her for ever the most unhappy person in the world, had destroyed himself because he had never known the truth; that she advised her never to irritate her people if she had not the power to conquer them completely; that otherwise the people became like a ferocious beast; that she advised her above all to give her confidence to those who can tell the truth and labor to discover it." Mademoiselle de Montpensier—the grande Mademoiselle—insinuates in her memoirs that Henrietta-Maria was not much moved by the terrible fate of Charles. But Mademoiselle, though she had much courage, did not show much sense during her long and agitated life. She was not the best judge of character. She would not condescend to marry the Prince of Wales, and she offered herself afterwards to Lauzun.

From the time of the death of Charles I. Henrietta's life was almost exclusively given to piety and to good works. She took no part in active politics, neither in England nor in France. She spent almost all her time in the convent which she established in a house at Chaillot, and which she bought from the heirs of Marshal Bassompierre. She visited England after her son ascended the throne. Her only object was to propose the marriage of her daughter with the Duke of Orleans. The sight of London, of her apartments at Whitehall and at Somerset House, became a torture for her. Her health was much enfeebled after her great misfortune. She wept constantly and fell in prayer. She thanked God for having made her not a queen, but an *unhappy* queen. Her piety had become a sort of exaltation. She returned to France as soon as the affair of the marriage of her daughter with Monsieur had been arranged. The ceremony of the marriage of the young Henrietta-Anne took place at the Palais Royal the 31st of May, 1661, and Henrietta-Maria, who had always lived with her daughter, had to separate herself from her. It is wonderful to read in Madame de Lafayette's charming life of Madame, and in Saint-Simon, the account of the short career of the new Duchesse d'Orléans. One kind of martyrdom was spared to Henrietta-Maria. The words used by Bossuet in his famous oration, "Madame se meurt, Madame est morte," did not ring in her ears. She died before her daughter, without much pain, and almost passed from life to death as she would have passed to sleep, at the end of 1669. The volume of Comte de Baillon will be found chiefly valuable for its latter part, the correspondence of Henrietta-Maria, which occupies nearly half the volume.

Correspondence.

THE ENCYCLOPÆDIA OF BIOGRAPHY.

To the Editor of The Nation:

Sir: The 'Encyclopædia of Biography, noticed in the *Nation* of this week, to which my name is attached, was prepared some thirty years ago, as one of a series of brief, popular "hand-books," without any pretensions to completeness. It has since been enlarged and changed, as I understand, but I have had nothing to do with it, and am in no way responsible for its publication, about which I was not even consulted.

Yours very truly,

Parke Godwin.

19 East Thirty-seventh St., New York, February 8, 1878.

PRESIDENT HAYES AND HIS CABINET.

To the Editor of The Nation:

Sir: In your article on "The Art of Politics," in your issue of Feb. 7, you bring out an idea of great value, it seems to me, to all Presidents who, like Hayes, endeavor to carry on reform. I refer to your statement that such a President supremely needs a "united Cabinet."

The real strain upon Hayes—and it is an immense one—is essentially moral in its nature. The vital question with him is: "Have I the stability to resist the great waves of disapproval and discontented ill-will that daily roll over me from the armies of politicians?" The fearful stress and strain upon the resolution, the manhood, of a single person breasting such waves, should find relief by the support of a Cabinet that was a unit in point of purpose and sympathy. It seems to me this should be the virtual requisition upon each member of it: "Your paramount duty is to give me sympathetic, whole-hearted support in my reform measures." If a President found it impossible to gain such support for many measures, let him seek it for two or three, or even one. Let minor issues or results be sacrificed to the great ones. A President surrounded by a Cabinet thus presenting a solid front to the country, would have at hand a moral power vastly helpful to himself and vastly influential with the people.

M.

Hartford, Conn., February 10, 1878.

THE WOODRUFF EXPEDITION.

To the Editor of The Nation:

Sir: In your issue of Jan. 31, 1878, appears a communication, signed "Navy," warning parents and guardians from allowing the young to have their characters and morals endangered in the "Woodruff Expedition."

"Navy" refers enquirers to naval officers, and especially to those who have visited foreign ports "on a school or training ship." I am a naval officer, and have served in practice-ships visiting foreign and domestic ports, and desire to bear testimony entirely opposite to your correspondent "Navy." I know of nothing in a practice-cruise for midshipmen, or in the Woodruff Expedition for students, which will be more injurious to their moral characters than the training and instruction pursued in fitting youths for any other profession or business, unless that, perhaps, of a school of divinity.

In making this statement, I speak not only for myself, but also for a large number of officers who think as I do, and who are surprised at the unusual views held by your correspondent "Navy."

Respectfully yours,

AN OFFICER OF THE NAVY.

WASHINGTON, D. C., Feb. 4, 1878.

[This case seems to be one in which an unlimited amount of testimony can be adduced on both sides, if one will only take the pains to collect it, because there will be no agreement as to what excesses and practices are dangerous to morals. The defence has the great advantage of having a strong interest in the manufacture of public opinion in its favor, whereas no one in the Navy or out of it has any personal interest in opposing it. It has been said, we do not know whether on official authority, that one of the reasons for discontinuing the practice-cruises of midshipmen to the Mediterranean was the difficulty of preventing the young men from contamination during the visits to foreign ports, and we believe that this is a case in which prudent people will take the safe side. We have, nevertheless, thought it well to submit the foregoing letter to an eminent naval officer of the widest experience, and we herewith print his comments.—ED. NATION.]

"No man sends his son from home in his early youth to a distant college, or training-ship, or counting-house, where he will be free from parental control and become a law unto himself, without the gravest concern for the temptations and demoralizing influences to which that son must be subjected. In a well-ordered training-ship, such as the practice-ships of the Naval Academy, where the greatest effort is made by judicious officers to protect cadets from vicious influences, and where the time and thoughts of the cadets are fully occupied by healthful and engrossing pursuits, the opportunities for vicious indulgence and the temptations to it are greatly diminished, and I believe that a young gentleman in a naval practice-ship, where the discipline is exact and the supervision careful, is far safer than he would be at a college or in a counting-house. In an ordinary cruising-ship, such as I served in in my early youth, the midshipmen were left with but little restraint to encounter the most dangerous temptations, and the moral risks incurred were such as might well alarm their friends. I know almost nothing of the Woodruff Expedition, and therefore can express no opinion in regard to it. As those who embark in it will pay their own expenses and be under little or no discipline, and may have no engrossing pursuit, they will encounter the temptations to which young men going far from home are subjected. So far as the practice-ships of the Navy are concerned, I fully concur in the opinion expressed by 'An Officer of the Navy.'"

HOW CAN A STATE BE FORCED TO PAY ITS DEBTS?

TO THE EDITOR OF THE NATION:

SIR: You think it can by a change in the Constitution, giving creditors a right to sue. There have been some similar, if not exactly parallel, difficulties which may be worth considering before you waste your powder on an amendment. The tenants of the Patroon, near Albany, were liable to process, yet for years they resisted the very reasonable claims on them which had, through the good nature of the Patroon, been left to accumulate too long. Process of law was found to be a worthless remedy, and compromise was successfully resorted to. To-day many communities, county and municipal, neglect to pay, and are not sued, and never will be until, like Secretary Boutwell's constituency, *they grow up to the amount* of their inflation and can conveniently stand it. Numberless bondholders of large railroads have waited and are now quietly awaiting payment while the railroad managers pay themselves out of the earnings for the debts *to* themselves which they have put upon their roads.

Why is it that these various classes of creditors submit? Simply because it costs more than they think it would come to if they sued. If a law was passed to-morrow giving retrospective right of process against the States, its only effect would be the bad one of deluding some more simpletons into lending money on the strength of it, and when pay-day came the creditor would need a long purse, an india-rubber neck, and a ball-proof jacket if he tried to issue process and sell out a State's property.

What, then, is the remedy? Some who lived in China half a century ago, before there were either English colonies there or consular courts, remember one *large business centre where no debt of any sort could be collected by law, and where the bad debts incurred were so small that they did not form an element in commercial calculation.* Cannot we get a hint from this as to the true remedy?

Railroads, counties, cities, and now it seems States, have had a credit granted them which they did not deserve. Let us recognize the fact that creditors have, under *any* laws you can frame, a very limited remedy against any of these classes of debtors, and instead of seeking a remedy in *more* law, let us find it as we used to in *old* Canton, by giving less credit, and looking more sharply into the character and means of those we trust.

To-day trust companies, savings-banks, and other institutions, managed too much by salaried agents, have lent more millions upon inflated real estate, not worth now near the mortgages, than all the defaulting States owe. There is law enough; but to-day the inflationists are trying to water the currency, first with silver, and, when that fails, with rags, in the vain hope of giving a fictitious value to the pledged property, and thus making it nominally worth the mortgage, with a remainder to the speculators who led us into this muddle. Instead of too little law for the collection of debts, we depend too much on law already. For the past debt let us compromise with some before they get too callous to their disgraceful situation, and let us pursue dishonest corporations by combined action. For the future, let those who have accumulated capital find some safer uses for what they have left near home, among their own neighbors and those they know are trustworthy. Let them try to make the seaboard States more prosperous by using capital at home, even at low rates of interest, and let the more distant communities wait for their improvements until they can make them, if not wholly, more largely out of the surplus which they themselves will accumulate in those fertile regions now well supplied with means of communication. Silver bills, paper mills, and changes of the Constitution will be tried in vain to check the evil by one party or the other. Common sense based upon the immutable laws of political economy will some day (perhaps after more years of suffering under the quackery we resort to) come to the rescue.

As I should be torn to pieces by the fanatics for change of laws if I confessed my nationality, I take the friendly covering familiar to my ears forty years ago under the shadow of the Bocca Tigris, and subscribe myself

FAN-QUI (Foreign Devil).

THE POWER OF THE STATES OVER LEGAL TENDER.

TO THE EDITOR OF THE NATION:

SIR: The meeting of merchants held a few days ago at the Board of Trade and Transportation endorsed and strengthened the position taken by the banks and bankers, that as a matter of voluntary action they will trade and transact business on the basis of gold alone. Something more than this can, however, be done, and that something very much more effectual.

During the war we heard very much about the latent powers in the United States Constitution which from time to time manifested themselves in most surprising forms. Now, let us call forth the reserved powers of the States and localize as much as possible the consequences of cheap money and dear commodities, and so let a fluctuating currency, uncertain values, and absence of commercial and financial credit—as chickens and curses are said to do—roost at home.

The Constitution of the United States says: "No State shall make anything but gold and silver coin a tender in payment of debts." This implies that the States, not the United States, shall have control of the subject of tender, as it has of all matters of contract, subject to the limitation that such tender must be "gold and silver coin."

The extent to which either shall be a tender is not set forth. Now, pray, what is to hinder all the States not affected by the silver theory from passing a law as follows?

Section 1. On and after January 1, 1879, all debts, obligations, and contracts, express or implied, shall be discharged and dischargeable only in gold coin of the United States of America, issued under Section 3,511 of the Revised Statutes, at their nominal value; and to the extent only of twenty dollars shall such debts be dischargeable in silver coin of the United States of America, issued under Section 3,513 of the Revised Statutes of the United States (trade-dollar). And such gold coin shall be the sole legal tender in payment of all debts, public or private, at their nominal value, when not below the standard weight and limit of tolerance provided by the United States

Coinage Act, and, when reduced in weight below such standard and tolerance, shall be a legal tender at a valuation in proportion to their actual weight; and such silver coin shall be a legal tender at their nominal value for any amount not exceeding ten dollars in any one debt, if such debt exceeds such amount, and the minor coins of the United States shall be a legal tender at their nominal value for an amount not exceeding twenty-five cents in any one payment.

Section 2. All judgments, decrees, and orders of the courts of justice rendered after January 1, 1879, for the payment of money shall be payable, and the interest thereon shall be payable, in gold coin as aforesaid, except so much thereof as may be payable in silver coin, as hereinbefore provided.

Section 3. On all contracts, express or implied, or damages for wrongs to property or persons, made or committed prior to January 1, 1879, which shall come up for adjudication after said date, the courts shall reduce the currency to the value of the gold dollar as it stood when the cause of action accrued, and upon such amount compute the interest in gold.

In the case of the State of New York the following additional section would be necessary:

Section 4. Chapter 73 of the laws of 1875, entitled "An act to establish specie payments on all contracts or obligations payable in this State in dollars, and made after January 1, 1879," is hereby repealed.*

Section 5. This act shall take effect immediately.

This would be the effectual way to answer the United States Congress in advance of the passage of the Bland Bill, and shut the door to much of its evil consequences. Every intelligent physician will, when he has a case of inflammation to deal with, try to localize its effects. Since the subject has been under discussion I have been reflecting as to the means of accomplishing such a result as to the silver inflammation. In this I have been much aided by a letter received from a determined opponent of the demonetizing of silver act of 1873, in which he made quite an ingenious argument that Congress had no power over legal tender at all.

The States which send to Congress members who believe that coining silver is a good thing can try the experiment, and grow, as the speeches of their representatives promise, prosperous upon its results. We, who believe that calling ninety cents a dollar will not make it so as to future transactions or unmake the moral obligations of past ones, may be permitted by this piece of legislation to suffer alone the consequences of our notion. Hereafter we would treat with the States who think otherwise as all nations treat with those who wilfully debase their currency, and say, "You must deal with us in our currency, not in yours." Thus, England trades with Turkey in pounds, shillings, and pence. We have localized what we believe to be a financial disease, and if our friends who now differ from us are in the right as to the expediency of the Bland measure, they get all the benefits of a silver, and we all the injuries of a gold, standard.

Of course it is idle to suppose that the Bland Bill will maintain two standards. A Western politician who has not even seen a twenty-dollar gold-piece in circulation since 1862 will admit the truth of the Gresham law, that a cheaper currency will drive out the dearer of the same nominal value, as one of the few truths, if not the only truth, comprised in that "tyrannical capitalist, bondholder, and coupon-clipper" series of inventions called political economy.

Respectfully, SIMON STERNE.

614 FIFTH AVENUE, NEW YORK, Feb. 7, 1878.

PROFESSOR WALKER ON BI-METALLISM.

TO THE EDITOR OF THE NATION:

SIR: "Hertzka's Translator," referring to the proposition of the bi-metallists, as he states it, "that legislation can control natural forces for definite results," adds: "Prof. Walker nowhere discusses this issue, nor does he present it to his readers." This statement, though not, I am sure, so intended, is likely to do me grave injustice if not corrected.

In fact, I start the question as to the power of a fixed legal rating to keep the metals in concurrent circulation at the foot of page 257 of my book on money; on page 258 I quote M. Cernuschi's vigorous statement of the bi-metallists' claim; on page 259 I express the opinion that "economists have been too much disposed to treat slightingly the agency of law in determining the demand for, or the supply of, articles of commerce." Mr. Mill is then quoted in admission of the practical effects of the laws prohibiting the export or melting of the coin; and the remark is added, "But while law can do something in the way of affecting values, it cannot do everything; and what it can do is rather by way of directing or diverting economic forces than of squarely opposing their current." M. Hertzka is then quoted at length in refutation of M. Cernuschi's claim that a legal rating as wide of the market rating as 1:1 could be established in the coinage, and concurrent circulation be still maintained. On pp. 262–3 the opinion is expressed that Hertzka's refutation of the 1:1 assumption is complete; but that with a legal rating near the market rating the tendency to divergence in value might be restrained through a considerable period of time, and against considerable changes in the conditions of production of the one or the other metal. "Just so soon and just so surely as silver, for instance, tended to become cheaper, from causes affecting the supply, would the desire of every debtor to pay with the cheaper metal operate upon the demand for that metal, bringing it back towards the legal rating." Whether this restraining force would prove sufficient wholly to withstand the impulse to divergence, would depend much on the volume of indebtedness from time to time maturing, and thus creating a demand by preference for the cheaper metal. The subject is further continued to page 267, closing with a quotation from the late Mr. Bagehot respecting the scheme of the Latin Union, "which made gold and silver legal tender; which established a fixed ratio between them. In consequence, whenever the values of the two metals altered, these countries acted as equalizing machines. They took the metal which fell, they sold the metal which rose, and thus the relative value of the two was kept at its old point."

Now, all this may not attain to the dignity of a "discussion," in the estimation of "Hertzka's Translator"; but I certainly have, within the limits of my capacity, "presented the issue" to my readers, and have done so, I believe, with perfect fairness and good faith. It is very hard to be posted in the *Nation* as having dodged so vital a question when I have given to it ten pages, with the results of my best study and reflection.

My critic is much disaffected at the illustration derived from the driving-in-span of horses of different rates and styles of movement. I do not see why the illustration is not appropriate and effective. The mono-metallist asserts that gold and silver cannot remain in concurrent circulation, because each has its own sources of supply, subject to peculiar conditions, and its own demand, also subject to peculiar conditions. Hence it is unreasonable to suppose that their value in relation to each other can long remain at any one ratio.

I answer, there never were two horses of precisely the same rate and style of movement; yet horses are harnessed and driven by pairs. A pair of horses are brought up to my neighbor's door. Were they to be driven separately from here to Hartford they would probably not accomplish any one mile of the thirty-six in the same time. Even when driven together they do not, however perfectly matched or well handled, take one step exactly alike. Yet they leave my neighbor's door within a fraction of a second together in the morning, and bring up in front of the hotel at Hartford within a fraction of a second together at evening. All the way each horse has been exerting by far the greater part of his force in a direction to move the carriage forward in accord with his mate. Another part of his force, very small, indeed, in the case of well-trained horses, has been exerted divergently, in a way to check his mate and rack the carriage. Yet, if the harness, the pole, the carriage, and the driver's hand are strong enough, the horses will accomplish the journey together almost as well as if God had made them mates instead of man. Now this, as I understand it, is "controlling natural forces for definite results"; and if one man in his sphere can do this, why may not the collective might of the nation do this in its sphere?

But, says my critic, "Whatever restraint the driver exerts over the horses is won at the expense of the carriage, the harness, and the driver's arm." Granted; and I thank him for so happily completing the illustration. Each horse of the pair moves with somewhat less freedom, and hence with less force, in span than singly; just as he moves in single harness with less freedom and force than when galloping over the fields without bit or rein. Yet his being harnessed is the very condition of his accomplishing any useful purpose. So the harnessing of two horses together is at the expense of a certain loss of efficiency in each, as well as of rack and strain to carriage and harness; yet men find it for their interest to drive horses together, in spite of this initial and continuing expense.

I do not think it necessary to apply the illustration, point by point, to the case of bi-metallism, the yoking together in the coinage of two metals which have, naturally, each its distinct economic course. The

* This repeal is made necessary because, by an unfortunate wording, the act is made to follow the course of national legislation, in the interim, upon the subject of tender.

success of the undertaking will depend on the strength of the impulses to divergence, compared with the restraining power of the legal-tender principle. The latter will be more effective the larger the body of indebtedness from time to time maturing.

I cannot accept the distinction, in principle, which "Hertzka's Translator" draws between the views of M. Cernuschi and those of M. Wolowski. The difference between these two authors is wholly as to the degree of efficacy which they severally attribute to the legal-tender principle. M. Wolowski asserts for law a power to restrain the tendency to divergence between the values of gold and silver, to such an extent that powerful causes operating through long periods to produce divergence may be brought within very narrow limits in their actual effects. The wider the adoption of a legal rating, the closer the approach to absolute conformity. "Add," he says, "to the natural *solidarité* which unites the two metals called to work together in the same office, the legal *solidarité* which would result from the adoption, in common by all the civilized states, of the same ratio between the two kinds of money, and the slight oscillation to which the relative value of gold and silver has been subject these sixty-four years* will become still more rare and more restricted."

M. Cernuschi, with less caution and less judgment, declares that any legal rating, no matter how wide of the market rating, will suffice to hold the two metals in concurrent circulation. But he appeals to the same principle to accomplish this as does M. Wolowski. The only difference between the two is in their estimate of the forces which tend to produce divergence and the forces which tend to secure conformity.

Respectfully yours,

Francis A. Walker.

New Haven, February 8, 1878.

SILVER MORALITY.

To the Editor of The Nation:

Sir: Your remark that there is a thread of knavery in the silver movement in all its phases I have demonstrated to be true over and over again. This is my method: In arguing with the "silver-man," my first question is: "Are you in favor of putting into the silver dollar as much silver bullion as a gold dollar will buy?" In more than ninety-nine cases out of a hundred the answer is "No." The ostensible reason why men in the West favor the remonetization of silver is that remonetization will make a return to specie payments easier, "because," say they, "it will broaden and make firmer the basis on which the Government will stand when it shall begin to call in its legal-tender." The real reason why men in the West favor remonetization is that it will give somebody an opportunity to cheat somebody, and we fondly and foolishly imagine that we in the West are the somebody who is going to do the cheating, and that you in the East are to be our victims. Right here is the trouble. If the silver movement were merely a delusion and nothing more, it would pass away under the rays of sound argument as the mists of the morning before the rising sun. The trouble is deeper. As matters now stand, you may prove to a "silver-man" by argument as relentless as a demonstration of Euclid that the silver movement is immoral and at war with the highest well-being of the nation, and he is a "silver-man" still. The silver movement has strength because there is a low morality among the people both in private matters and public matters.

During the period of inflation, men made, or thought they made, fortunes when scaling their expenses by and basing their calculations upon the greenback as a standard. When times began to change, they still continued to spend and calculate upon the old inflation basis. The result has been mountains of broken promises and myriads of defaulters. Defaulting, cheating, and the like, because of their frequency, have ceased to be reprehensible. The man who in his larger transactions habitually breaks his promises and cheats his creditors who are at a distance, retains his place in society; he is a good neighbor and a real sociable fellow. He comes to be looked upon as not a bad sort of man, though he is a "little sharp." When this is the condition of society at large in its private dealings—and certainly this is the condition of society in the West—it would be surprising if such a society were to attain to high political morality, or be in favor of honest money. Mr. Editor, how shall this condition of things be remedied?

An Old Subscriber.

Notes.

D. APPLETON & CO. have in press a 'History of Opinions on the Scriptural Doctrine of Retribution,' by Dr. Edward Beecher.——Sheldon & Co. will shortly publish a religious novel, 'Ernest Quest, or the Search for Truth,' by Mrs. S. R. Ford.——From the publishers of *Scribner's Monthly* we have received a framed impression of the head of Lincoln engraved for the February number of the magazine. The artistic merit of this portrait is considerable; and while the last photograph of Mr. Lincoln need not therefore be the best, it was, to judge from this sympathetic copy, a more than ordinary success.——Harper & Bros. send us bound volumes of their *Monthly* (vols. 54, 55), *Weekly* (vol. 21), and *Bazar* (vol. 10), all for the year just elapsed. The permanent value of the *Monthly* is incontestable, and we cannot say that the *Bazar* is not worth the space it occupies on the shelf, in spite of the temporary duration of fashions. The *Weekly* holds a place between the two, but still asserts its utility in the household, if only as a never-failing source of amusement for the younger members. We have been struck again with its peculiar effectiveness in fixing in mind the political character of the period which it covers. This twenty-first volume, for instance, begins amid the echoes of the Presidential struggle, and then pictures successively the Electoral Commission, the inauguration of President Hayes, his untried Cabinet, his "policy" (before which Mr. Nast gracefully succumbs), his order to office-holders, the opening of the war in the East, the short and sharp conflict with the Nez-Percés, MacMahon's fruitless *coup*, the silver mania, the death of Morton. Such was 1877.——During the past week Houghton, Osgood & Co.'s Riverside edition of the British poets was enlarged by five volumes, embracing the ten which formerly contained Scott's complete poetical works. The plates seem to us to show much fewer signs of wear than some of the previous volumes of this excellent series.——The annual report of the State Geologist of New Jersey for the past year shows how wisely that small State is governed, and what practical work the Survey is doing for the development of her great and in some respects unsurpassed natural resources. This brief pamphlet has a general interest from its chapter on the glacial drift in New Jersey. The terminal moraine of the great Northern ice-cap is minutely traced from its southernmost point at Perth Amboy (40° 30') across the State on the one hand and across Staten Island and Long Island on the other. A shaded map shows its course very distinctly. The Survey has in preparation a topographical map of the country between First Mountain and the Hudson River, on the scale of three inches to a mile.——Macmillan & Co. will shortly publish a 'Life of George Combe,' one of the most philanthropic and widely-read authors in the English language, by Charles Gibbon. It will contain a fragment of an autobiography.——Prof. Ten Brink's 'History of Early English Literature' is, according to the *Academy*, about to be translated into English by H. M. Kennedy, at present in Leipsic.——Devotees of the ceramic art will learn with regret of the death of Mrs. Fanny Bury-Palliser, author of the 'China-Collector's Pocket Companion,' of a 'History of Lace,' and of other useful and agreeable works. She was a sister and a colaborer of Joseph Marryat, the well-known authority on china and porcelain, and of Captain Marryat the novelist.

—We recently called attention to a translation of Roscher's 'Political Economy,' by Mr. J. J. Lalor, to be published by Callaghan & Co., of Chicago. Mr. Lalor has just received a letter from Roscher, in which occurs the following passage, stating his views upon free trade; it will be read with interest as defining the position upon this subject of the so-called "Historical School" of Political Economy, of which Roscher is regarded as the leader: "As in other departments," he says, "so in this, I regard freedom as the rule, from which any one who asks for an exception has the burden of proof against him. Therefore, in cases of doubt freedom should always be taken for granted. But in practice there are exceptions—very few at advanced and at the same time flourishing styles of culture, but in yet undeveloped or decaying nations more numerous in proportion as they are further removed from the highest stage of development." It is proper to add that Roscher's views on this subject are not contained in the original work, but will be given in the forthcoming third volume, of which he is to furnish two chapters (on International Trade and Paper Money) as appendices to Mr. Lalor's translation.

—Cassino, of Salem, who is in the way of becoming a publisher as well as an agent for naturalists, has promptly brought out the second part of

Professor Eaton's 'Ferns of North America,' the character of which is well sustained. On the first plate the rare and ambiguous *Asplenium ebenoides* figures—rather too stiffly—by the side of the common ebony spleenwort, *A. ebeneum*. As to its conjectured hybrid origin, we doubt if it has a particle of the blood of the latter, or of the walking fern, in its free veins. The three little moonworts are well rendered, and the woolly-lip fern is best of all. Mr. J. Williamson sends us specimen-etchings (of the rare bristle fern) which are to illustrate a popular hand-book of the Ferns of Kentucky, to be published in May by J. P. Morton & Co., of Louisville. The figures are not bad.

—The *American Almanac* for 1878, edited by Mr. Ainsworth R. Spofford, the efficient Librarian of the National Library, and published by the American News Co., deserves more than a passing mention. Mr. Spofford's resources for the compilation of such a work are almost unapproachable, and in the main we can praise the judgment with which he has selected his material. The book opens with a very readable account of the history of almanacs, which is presently succeeded by an elaborate description of the national capital that would serve very well as a tourists' guide. Of the rest of the contents we shall only be able to enumerate the more novel or important features. The Constitution of course is given, and a list of the members of the 45th Congress, with the committees; also, tables of the several Presidential elections, by electoral votes and by popular vote in each State; a brief history of national political conventions, and an historical sketch of the electoral system of choosing the President, from which last it appears that the Convention disapproved almost unanimously of an election by direct vote of the people, but voted three times (once unanimously) to give the election to the two houses of Congress; once to a body of electors chosen by the State legislatures; and finally to electors chosen as these legislatures might order. The executive officers of the United States; the personnel and fees of our consular service; and foreign legations in this country, are usefully named. Commercial and financial statistics are abundantly provided. Exports and imports, internal revenue receipts for 1833-77, railroad statistics, a chapter on "Strikes, Past and Present," tables showing the price of staple commodities for the period 1825-77; commercial crises in England during the present century; the English tariff (shade of Protection even as mitigated by Fernando Wood!) printed on a single page, and not filling that with its twenty-two articles; municipal indebtedness and taxation, 1866, 1876, showing an "increase of debt, about 200 per cent. average, of annual taxation about 83 per cent., of valuation about 75 per cent., of population about 33 per cent."; the Bank of England and its discount rate from 1694 to 1877; the Bank of France and how the milliards were paid; the British debt; the price of Government loans in London, December 1, 1877; the U. S. currency-value of gold, and gold-value of currency, 1862-78—such are the chief matters in the above-mentioned departments. Among "burning questions" of the day postal savings-banks, the income-tax, and metallic currency occupy a large space. In giving a history of the income-tax Mr. Spofford betrays the only bias of which we can confidently accuse him. He unquestionably thinks the tax ought to be restored, and adduces this communistic argument: "It is evident that only about a million of the population [the 250,000 taxpayers and their families] were interested in having the tax repealed, while the remaining 39,000,000 out of 40,000,000 of people in the United States were interested in having it maintained." Mr. Spofford does not explain what he means by "interested," nor does he cite a single consideration bearing on the reasonableness of the opposition to the tax. Not so when he narrates the history of demonetization, when he gives the arguments *con.* with a voluminousness that must surprise those bi-metallists whose stock in trade is "surreptitious" and "Shylock." He also gives the arguments *pro*, and we cannot positively say what his own convictions are—as ought to be the case. In connection with this exposition, Mr. Spofford furnishes important statistics of the coinage of the U. S. mint, tables of the gold and silver product, of silver fluctuation, and national bank circulation; and other facts relating to the currency, including a history of the Latin monetary union.

—The first annual report of the Virginia Commissioner of Agriculture marks an era in the history of that State. The department over which he presides was created only last year, and the duties imposed upon him bear the usual relation to the compensation which the rural mind everywhere thinks sufficient for scientific services. The Commissioner is allowed a salary of $1,500, and is expected to edit a hand-book of the geological formation of the several counties; to superintend the analysis of fertilizers, and to try as a judge manufacturers whose compounds fall below their pretensions; to look after diseases of the crops and report remedies; to "have in charge the mining and manufacturing interests" and establish a cabinet of minerals duly "labelled and arranged" for "public inspection"; to encourage horticulture and fruit culture; to report on the dairy and on the culture of wool, and "give his attention" to irrigation and the subject of fencing; to distribute seeds, etc. He is allowed a clerk at six hundred dollars, one thousand dollars for the purchase of chemical apparatus, and the department is credited besides with $1,900 (in all $5,000 per annum) for contingent expenses, including the pay of a chemist and geologist! Dr. Pollard, whose bonds are fixed at $10,000, does not make a wry face over this adaptation of means to ends, but goes bravely to work, doing the best he can. On page 11 he remarks that he is "reliably informed that a proper geological survey of each county in the State would involve an expenditure of from thirty to forty thousand dollars," and that as Dr. Ruffner, the accomplished Superintendent of Public Instruction, has made *en amateur* a great many field notes and geological sections, and offers his material freely to the department, it would be well if he could be made an assistant without prejudice to his regular duties, and with the mere payment of his expenses. The report is a summary of the vast half-developed resources of one of the most favored States in the Union, and imperfect as it confessedly is it is one of the best hand-books for emigrants we have ever seen. But one thing is lacking, and that is a statement that Virginia intends to pay every farthing of her honest debts. Perhaps that can be prefixed to the next report.

—The chapter on labor in Virginia is perhaps the most significant in the report. Dr. Pollard says it has become too much the custom to denounce the negro as thriftless and lazy, whereas the true Southern policy is "to elevate and encourage this race in every proper manner, not to debase and abuse it." He adds from his own experience as a farmer under both régimes, of slavery and freedom, "that the negro, *if promptly paid and fairly dealt by*, is as *good a laborer as he ever was*"; and that, while some will not work, "the majority of them, and enough to till the lands," will; and he concludes with this interesting comparison:

"An argument used against negro labor is that white hands accomplish most work. This is more than doubtful. In the report of the Massachusetts Board of Agriculture, Charles L. Flint, Secretary (we forget the volume), will be found an account of the cost per acre of cultivating corn and other crops in that State, with a statement of the number of days it took to pull the fodder and cut the tops of an acre of ground, how long to plough the crop, and how long to hoe it. At the time of reading the report we made a calculation, in connection with another farmer, of how long it would take to accomplish the work here in Virginia, and came to the conclusion that our negro hands would do more work per day than the white laborers of Massachusetts."

—New York has sustained a serious, and in some ways irreparable, loss, in the death, on Saturday evening, of Mr. Theodore Roosevelt, whom the President recently nominated for the collectorship of this port. He was during the war, though then a young man—he has died at forty-six—one of the most indefatigable supporters of the Government in every way but service in the field, and, above all, a constant promoter of all schemes for the alleviation of the suffering and distress arising out of the war. He devoted himself during the greater part of it to the collection on behalf of the soldiers, and under their orders, of the sums allotted by them from their pay for their families, and saw that it reached them without loss or expense. Ever since 1865 he has been a leading aid of all the best charities in the city. The Children's Aid Society had no more liberal friend and faithful worker, and it is safe to say that there is hardly an organization for the promotion of any great public interest, philanthropic, or artistic, or scientific, for which he has not labored diligently and energetically, paying both with his purse and person without stint. His success in raising money for public purposes was very remarkable—we remember hearing one gentleman say, half jocosely, that Mr. Roosevelt's absence on a short European trip would save him $1,000—and of course it would not have been possible if he had not himself been ready to head every list handsomely. Inherited fortune, as well as his own success, enabled him to retire early from active business, and indeed gave him largely the control of his time when in business, and he brought into his service of the public a soundness of judgment and a freedom from illusions which to many enterprises were of inestimable value, but which never cooled in the least his own hope or courage. In fact, it is a rare thing for any modern city to have such a citizen, and rarer still for one with so much devotion to the public service to make so few mistakes. He was not himself a man of high culture, but nobody was more keenly alive to its value or readier to re-

spond to its demands, and we believe the mere fact that New York could even in these later evil years produce him, and hold his love and devotion, has been to hundreds of those who knew him and watched his career a reason for not despairing of the future of the city. He was, too, physically so vigorous and manly a man that there was every reason for believing as well as for wishing that he would reach old age; and his untimely end, in the midst of everything that could make life attractive, is perhaps as striking a reminder as his friends could receive what shadows we are and what shadows we pursue.

—If the historical literature of 1877 is distinguished in any department it is perhaps in that of the biography of historical characters, of which there appears to be an unusual number. Two works are devoted to Simon de Montfort—that of Prothero and the translation of Pauli. Of more modern characters there are Ewald's 'Life of Sir Robert Walpole'; Ranke's 'Memoirs of Prince Hardenberg'; Lodge's 'Life of George Cabot'; Mazade's 'Cavour'; Trollope's 'Pius IX.'; and Pierce's 'Life of Charles Sumner.' Sime's 'Life of Lessing' may also be mentioned; and Villari's 'Machiavelli e i suoi tempi' is a work of great importance—the first volume, the only one published, reaching the year 1512. In the same field as the 'Life of Cabot' is Prof. Adams's 'New England Federalism'; and the period of another of these biographies, that of Walpole, finds excellent illustration in Dr. Doran's 'London in the Jacobite Times.' Knight's (Catholic) 'Life of Columbus' is also praised as a careful and scholarly work.

—The study of primeval history has also received important contributions in McLennan's 'Studies in Ancient History' (containing his valuable papers on primitive forms of marriage) and Morgan's 'Ancient Society,' a work which stands in the first rank in this field. Squier's important work on 'Peru' may also be mentioned in connection with these. On early history we have the first volume of Brugsch's 'Aegypten unter den Pharaonen.' There is not much else of the highest value in ancient history; but Mason's 'Persecutions of Diocletian' (rehabilitating that monarch) is of great merit, and Hirschfeld's 'Untersuchungen auf dem Gebiet der römischen Verwaltungsgeschichte,' though rather in the line of antiquities than of history, is nevertheless indispensable in the history of the empire. A second volume of Kremer's valuable 'Culturgeschichte des Orients' has appeared. We will note also the third volume of the translation of Ihne's 'History of Rome,' embracing from the Second Macedonian War to the capture of Numantia (B. C. 133).

—The most important work in mediæval history is Perrens's 'Histoire de Florence,' of which the three volumes published reach the year 1300. Not history, but materials for history, is Janauscheck's 'Origines Cistercienses' (vol. i.), containing a copious collection of documents illustrating the history of this most interesting of the monastic orders. A previously unknown chronicle of Adam of Usk (1377–1404) has also been brought to light and published; it is very important for the reign of Richard II. The second volume of Skene's 'Celtic Scotland' is devoted to the Church and Culture. Mr. Froude's papers on Becket in the *Nineteenth Century* deserve also to be mentioned. For students of genealogy and chronology there are Grote's 'Stammtafeln' (408 in number), to which is appended a 'Calendarium medii ævi.' There are also two valuable republications: Finlay's 'History of Greece' since the Roman domination, in seven volumes, and the first volume of Green's 'History of the English People,' enlarged and provided with notes, etc. Wattenbach's 'Geschichte des römischen Papstthums' is also mainly confined to the Middle Ages. Hertzberg's 'Geschichte Griechenlands,' covering nearly the same ground as Finlay's, is brought down (in vol. iii.) from 1470 to 1321.

—Two companion works, somewhat opposed in their point of view, Freeman's 'Ottomans in Europe' and Creasy's 'Ottoman Turks' (a republication), belong, like two or three of those just mentioned, to both mediæval and modern history. Another republication is Dyer's 'Modern Europe,' in five volumes, brought down to the war of 1870. Of the first rank in modern history is Gardiner's 'Personal Government of Charles I.,' extending from 1628 to 1637. The second and third volumes of Kitchin's 'History of France' complete the work; it is especially good in political history. Vulliemin's 'Histoire de la Confédération suisse,' by a veteran Swiss historian, is perhaps the best brief history of that country, and would be a very good book to translate into English. For the early part of the sixteenth century we have Philippson's 'Heinrich IV. und Philip III.,' and the second volume of Gindely's 'Thirty Years' War'—especially valuable as being from a Bohemian pen. A new work of the Heeren and Ukert (and Giesebrecht) series is Hillebrand's 'Modern France,' of which the first volume was noticed by us last week. The tenth volume of Taxile Delord's 'Second Empire' completes the work (the author has died within the year). Parkman's 'Count Frontenac' is the most important work in the field of American history. Lastly, we will mention the first volume of Friedrich's 'Geschichte des vaticanischen Concils,' extending to the year 1869; and, as a companion, Cardinal Manning's 'True Story of the Vatican Council.'

SCHLIEMANN'S MYCENÆ.—II.*

WHEN we say that the treasures found at Mycenæ may safely be assigned to the heroic age, we are still far from assigning a definite date either to them or to the age itself. "The heroic age" means the indefinite period before the Dorian invasion, when the forms of government and the civilization described in Homer prevailed in Peloponnesus. At present we have no means of settling the date even of the Dorian invasion, which, indeed, was probably a long and difficult struggle rather than a triumphal march. The line between the Homeric civilization and the Dorian is nevertheless a very marked one, far more definite, indeed, than any positive date could be in so wide a field. We have now an unexpected and welcome view of the art of a most interesting age, one whose legends have played a greater part in the world's education than those of any other, but which, as an historic period, was supposed to be for ever buried in oblivion. It is too soon to begin to be dogmatic about the lessons which this discovery teaches in the history of art. It is enough for the present that Homer is now amply justified in his accounts of works of art with which the Achæans were familiar, and that we are now sure that Agamemnon could have found in his treasure-chamber at Mycenæ all the arms and ornaments with which he is said to have arrayed himself for battle. Even if nothing has been found equal in design and beauty to the shield of Achilles described in Homer, still we have enough to show that the poet was not drawing a purely ideal picture entirely beyond his own experience. The intercourse of the heroic Achæans with foreign lands, which the traditions (our only authority) constantly indicate, renders it more than probable that no small part of the best works of art found in Mycenæ may have been either directly imported from abroad or made at home by foreign workmen. The Phœnician traders doubtless brought to Greece whatever articles were likely to be bought by the Achæan princes, to whom they thus opened the rich markets of Assyria and Egypt. The first chapter in Herodotus tells of Phœnician merchants landing in Argos with Assyrian and Egyptian wares, and the well-known kidnapping and slave-trading propensities of the Phœnician race (witness Io and the two women kidnapped from Egyptian Thebes, Herod. ii. 54) may have made it as easy for the Achæans to import artisans as works of art. Nestor had in his employ a man, called both a goldsmith and a coppersmith, named Laerkes (Od. iii. 425), but we have no hint whether he was a Greek or a foreigner. That some articles of ornament were made in Mycenæ itself appears from the stone moulds there found, which were evidently made for casting gold and silver (pp. 107–109). As most of the ornamental goldwork is *repoussé*, it was easy for inferior workmen to produce good work by the use of artistic forms. The whole question of the relation of the art of Mycenæ to foreign art will gain much light from the study of the new treasures which General di Cesnola has brought home from Cyprus. This island, in which Greeks, Phœnicians, Assyrians, and Egyptians were in close intercourse at a very early period, now suddenly assumes a new importance in the history of art and in ethnology. We may pride ourselves as Americans that we now have in our country the most ample materials for studying this new subject; and we may also notice with satisfaction that Dr. Schliemann appends to his name on the title-page of 'Mycenæ' the title, "Citizen of the United States of America."

Every one will notice the rudeness and childish simplicity of the bas-reliefs on the sculptured tombstones compared with the more artistic work in gold and silver. Compared even with the sculpture of the Lions' Gate, the figures on the tombstones surprise us by their primitiveness. On the other hand, Dr. Schliemann (p. 85) calls special attention to the "marvellous accuracy and symmetry" which he finds in all the spiral ornamentation of these tombstones, which shows that they are not careless or unstudied attempts of beginners. Sculptures are more likely to be the work of native than of foreign artists, and perhaps these may

* 'Mycenæ: A Narrative of Excavations and Discoveries at Mycenæ and Tiryns. By Dr. Henry Schliemann, Citizen of the United States of America; Author of 'Troy and its Remains,' 'Ithaque, le Peloponnèse et Troie,' and 'La Chine et le Japon.' The Preface by the Right Hon. W. E. Gladstone. M. P.' Maps, plans, and other illustrations, representing more than 700 types of the objects found in the Royal Sepulchres of Mycenæ and elsewhere in the Excavations. New York: Scribner, Armstrong & Co. 1878.

prove to be the most genuine Achæan productions that have been found.

We have already described the manner of burial practised at Mycenæ, especially the partial cremation, and contrasted it with the Homeric accounts of burning the dead (see the *Nation*, No. 603). It is singular that the Greek poets after Homer sometimes call a tomb πυρά, or *funeral-pile* (*e.g.*, Soph. El. 901). This is now explained by the Achæan custom of burning the dead, so far as this was done at all, within the tomb itself, and leaving the remains undisturbed after the extinction of the fire.

We now recur to the interesting question which we postponed, whether there is good reason to believe that Schliemann has discovered the actual bodies of Agamemnon and his fellow-victims. What has been said will, we trust, do something to show how far this question admits of an answer. First, it is plain that these magnificent entombments must be placed in the heroic age, in which the names of Agamemnon and his family are conspicuous above all others. Secondly, none but royal personages of the highest dignity and of the greatest wealth could have been buried in such state. We are, therefore, compelled to believe that these remains and these treasures were buried during the most flourishing period of the Achæan monarchy of Mycenæ—that is, at about the time which tradition assigns to the Trojan wars. When we ask, further, whether this does not make it highly probable that these are the remains of Agamemnon and his friends, we have to reply that there is no evidence that can bear the test of scientific scrutiny leading us to so definite a conclusion as this. We are here dealing with a class of facts entirely different from those which establish the two conclusions stated above. In the first place, we cannot feel justified in maintaining the historic character of even the Homeric story of the murder of Agamemnon and Cassandra. We know how that story grew from the Homeric foundation, under the hands of lyric and dramatic poets, into the elaborate tale of horrors which we find in the 'Oresteia' of Æschylus; and who can tell how much it grew during the generations of epic bards which preceded the Homeric age? Again, we are by no means justified in believing that the only kings of the Pelopid race who reigned at Mycenæ were the two sons and the grandson of the founder, especially when that founder was the grandson of Zeus. The tendency of legend to concentrate upon a few famous names the history of many generations of unknown kings who died and left no name, is well known; and we may reasonably suppose that the meagre royal annals of Mycenæ are no exception to the rule. Indeed, the fifteen adults whose remains were found in the five tombs of the Agora, not to mention the three problematical children, far more than exhaust the whole list of important royal personages with which the legends of Mycenæ supply us, especially when we exclude Clytemnestra and Ægisthus. While, therefore, it is fair to conclude that these fifteen or more persons were all of the royal race and of the golden age of the monarchy, they are as likely to have been persons unknown to fame as the particular legendary personages whose names were saved from oblivion by the poets.

But it will be said that we have the express testimony of Pausanias that in the second century A.D. he was shown at least the sites of certain tombs at Mycenæ which were believed to be those of these very heroes. What now is the account of Pausanias? He says (ii. 16) that there is a tomb of Atreus, and tombs of Agamemnon and his companions. The one of Cassandra (he says) is called in question by the Lacedæmonians of Amyclæ; but there is a distinct one of Agamemnon, one of his charioteer Eurymedon, and a "single tomb" for Cassandra's twin infants, who were slain with their parents by Ægisthus. It is doubtful whether he adds that there is one of Electra, the text being very uncertain. This shows a belief among the local guides, probably from Argos, in five, or at most six, tombs. But this meagre tradition had no conception of the five tombs in which fifteen royal princes and such immense treasures are now found buried. The fact that Pausanias speaks of "the same tomb" as containing the two infants shows that he understood the others to hold single persons. Now Atreus, Agamemnon, and possibly Electra, are the only persons in his list who could possibly have been buried in such royal state. As to the twin infants, their very mention shows how utterly the local traditions had abandoned the whole story of Cassandra as it is told by both Homer and Æschylus. It is plain, therefore, that Pausanias heard at Mycenæ very much such a story as we should expect, about certain tombs which no one had seen for centuries, buried in the ruins of a city which had already been destroyed six hundred years, and containing the bodies of men who were supposed to have lived at least twelve hundred years before his time. Tombs, as well as other relics of heroes and demigods, were as common in Greece as those of saints are in modern Europe. Pausanias himself saw at Argos the tomb of Linos, son of Apollo; the finding the colossal body of Orestes filling a coffin ten feet long, and its removal to Sparta, are well known; the Theseum, now standing in Athens, is a monument erected over a huge skeleton, believed to be that of Theseus, which was found in Scyros with a spear and sword by its side, and brought to Athens in 468 B.C. by Cimon, son of Miltiades. Among the sacred relics seen at Delphi by Pausanias was the stone which Kronos had swallowed in the belief that it was the infant Zeus; and among the treasures stolen from the temple by the Phocians in the time of Demosthenes were the necklaces of Helen and of Eriphyle, the latter having been one of the wedding presents of Harmonia, wife of Cadmus and daughter of Ares and Aphrodite. Such was the value of Greek tradition attached to tombs and relics. In the case of the tombs of Mycenæ, strange to say, the truth has turned out far more wonderful than the fiction. But the fiction is none the more authentic for having erred for once in this direction.

What seems to be the strongest proof of the "Agamemnonian hypothesis" (as Mr. Gladstone terms it) is the supposed evidence that at least some of the persons buried in these tombs were murdered. When the evidence is sifted, the proof of murder will be found to rest chiefly on the statement that one, at least (perhaps all three), of the bodies in the First Tomb was buried "in strange and indecent fashion," a man more than six feet tall being squeezed into a space only five feet and a half long. The insult to the illustrious dead seems to be admitted on all hands. But let us examine this flagrant outrage. The tomb was hewn from the solid rock, 21 ft. 6 in. long, and 11 ft. 6 in. broad. This ample space was lined on all sides by a stone wall 3 ft. high and 2 ft. broad, and over this was built "a *slanting* wall of schist plates joined with clay," 6½ ft. high, projecting at the bottom a foot more than the stone wall, thus narrowing the breadth of the tomb by three feet on each side, and reducing the breadth of 11½ ft. to 5½ ft. (p. 294). Now, even if we suppose the mummy which was found squeezed into this space to have once been Agamemnon, and admit that he was murdered, are we to believe that Clytemnestra would have had these two stone walls, about 66 feet long, built around a tomb merely for the purpose of adding a last insult to her royal husband by squeezing his head between his shoulders? Could not all the horrors of that "human slaughter-house" devise some simpler means to so small an end? If, on the other hand, the murdered king was buried in a tomb in which these walls were already built, all proof of personal insult is gone. We would suggest that a simple solution of the mystery may be found if we suppose that this wall was built, not to insult the dead, but because the bodies were to be buried in a half-sitting posture, with their backs or their heads and shoulders resting against the slanting wall. We know very little about the position in which the other bodies in these tombs were buried, as they have all crumbled to dust except a few scattered bones; and what we do know does not agree with what we find in Homer about the burials of the heroic age. In the Third Tomb were found three bodies (of women, as Schliemann thinks, p. 164) "literally laden with jewels," one of which had upon its head the splendid gold crown, the gem of the collection (p. 185), and another wore a "magnificent golden diadem" (p. 186). Is it not at least within the bounds of probability that bodies thus crowned for burial would be placed in a partly erect posture? As this tomb had its walls artificially narrowed like the other, we are bound to assume the same insulting motives here also; and as all six of the tombs are thus narrowed (two, however, having perpendicular instead of slanting walls), we should carefully consider at the outset how far this outrage theory will lead us. It is now a remarkable coincidence that thirteen of the fifteen bodies in these tombs were buried with their *feet to the west;* and it may have been a reason for elevating the head in burial that thus the hero was made to turn his face towards the West, that region of romance and hope, where were the "Happy Isles," which Hesiod makes the home appointed after death for the "divine race of heroes who are called demigods," the very race whose tombs have now been opened. "These live, with minds free from cares, in the Islands of the Blest by the deep-eddying Ocean; happy heroes! for whom the fruitful earth thrice in the year bears in rich abundance its delicious fruits" (Hesiod, 'Works and Days,' 158–172). If this theory is tenable, it explains the "outraged" condition of the single body which is preserved, without any assumption of violence except that which the downward pressure of from twenty to thirty feet of earth and stones would naturally inflict in three thousand years. Such a pressure would squeeze the head of a body inclined as we have supposed between the shoulders precisely as this head now appears, and would also cause the mask which covered its face to be jammed down over the eyes like the one now found (p. 333).

Indeed, what has seemed strangest in the present condition of this mask is this appearance of having been subjected to an angular rather than a perpendicular pressure ; as Schliemann says (p. 311), "The lower part of the forehead has been so much pressed *upon the eyes and nose* that the face is disfigured." At the same time the nose and mouth and one of the eyes are perfectly visible, which could hardly be the case if the pressure upon the face had been perpendicular. It must be remembered that the body itself was reduced by the tremendous pressure "to a thickness of 1 in. to 1½ in." (p. 296). If, now, it had been lying flat on the floor of the tomb, could the mask exhibit its present appearance ?

Until further evidence is found, we are inclined to the belief that the tombs of Mycenæ contained the bodies of royal persons whose names are unknown to us; that, although possibly some of them may be among those who are mentioned in the heroic legends, there is as yet absolutely no proof of this ; that there is no evidence that any of these persons were murdered, or that any of them were buried in an insulting or ignominious manner ; that these royal tombs were closed and covered with earth at least before the Dorian invasion ; that the knowledge of the treasures buried in them, originally confined to a few trusty persons, gradually died out, and was extinct long before the Argive conquest ; that this ignorance of the true character of these tombs saved them from pillage (except, perhaps, on a single occasion) while Mycenæ was deserted ; and that Pausanias heard only the vague tradition then current in Argos, that *there were tombs* in Mycenæ attributed to Atreus and to Agamemnon and his fellow-victims. Finally, we believe that Dr. Schliemann has made the most important contribution of the present century to Greek archæology.

RECENT POETRY.

THOSE who are eager to see the muse of America produce epics lofty as her snow-clad mountains, vast as her rolling rivers, and equalling in several other ways several of her other natural features, may point with some pride, at last, to the Michigan poem entitled "Teuchsa Grondie" (Detroit : E. B. Smith & Co.) Physically measured, it fills an octavo volume of nearly five hundred pages ; it is divided into twenty-eight cantos, each dedicated to a different friend or group of friends, the last canto being inscribed to the whole citizen soldiery of the United States. It is written by Levi Bishop, Esq., of the Detroit bar ; and aims to tell the complete legendary history of that city. If epic art consists chiefly, as some critics of Milton have maintained, in the unstinted use of high-sounding proper names, then neither Milton's list of fallen angels nor Homer's catalogue of ships can be held equal to "Teuchsa Grondie." How can mere Greek or Hebrew appellatives compete with these Indian names that roll so freely from Mr. Bishop's pen ?—

> "The chiefs and sachems understand
> And soon obey the high command.
> The fiery warrior Ish-ko-dah
> Is coming with black Kah-gah-gee ;
> The spider chieftain—Sub-be-kah,
> With lordly bison—Pez-he-kee.
> Sage Ko-ko-ko-ho rolls his eyes,
> And comes with quiet Che-to-waik ;
> Loud Shan-go-dah the foe defies
> And comes with serpent Ken-na-beck,
> And Wa-be-no-ka proudly meets
> With seignior chiefs of mighty name ;
> These stately Mus-ko-do-sa greets
> With others now unknown to fame" (p. 275).

We should say, however, that if Mr. Bishop could get even this moderate number fairly established on fame's rolls, he would accomplish something. It is a tale of war that the poet tells, varied by pestilence, famine, hunting, missions, and dreams. Teuchsa Grondie is an Indian village, whose supposed history from 1565 to 1665 is here laboriously given. The village life was gay, it seems, though it had to forego some of the delights of cities :

> "No horses graced that paradise,
> For servitude or proud review ;
> And, hence, no 'Running on the ice,'
> Or racing 'On the Avenue'" (p. 74).

Indeed, the environs of the woodland village could scarcely be called attractive, as thus painted, at nightfall :

> "The owl whoops out a doleful note,
> The frighted curs in terror whine,
> No more sweet Wa-won-ais-sa sings ;
> Unnatural wolf-howls wildly float,
> The evening star forgets to shine,
> The pappoose to its mother clings" (p. 31).

The crowning battle-piece of the book opens as follows :

> "What earthly comfort can compare
> To that which comes on gilded wings
> As round us gathers black despair,
> And hope anew upon us springs ?
> Ah, listen ! On the northern plain
> Loud bursts the war-whoop from afar ;
> Ah, welcome, Kan-ne-tow, again !
> Thrice welcome, brave Tai-go-ne-ga !
> The Hurons rush upon the field—
> The friends of ruined Matchedash ;
> And with them fearless Wyandot ;
> A hero every man appears ;
> Ho-dé-no-sau-nee, die or yield !
> Now comes the final thunder-crash ;
> Now tremble, haughty O-to-quot !
> Ah, Teuchsa Grondie, quell your fears" (p. 427).

It reads like a battle of philologists—Max Müller and Fitzedward Hall pelting each other with hard words—or like Bret Harte's scientific society upon the Stanislaus. What "chunk of old red sandstone" could be a missile so fearful as this discharge of Otoquots and Matchedashes ? Yet we seem to miss here the name, previously celebrated, of Ko-ko-ko-ho, an appellation so irresistibly suggestive of Béranger's "Co-co-coquérico." Perhaps it is the self-same warrior, or he may be a myth of all nations, and may originate in the domestic barn-yard. At any rate, by turning back a few pages, we find that the hero is already sunk beneath the flood of battle, and not likely to reappear :

> "Into the flood fierce Do-ka-tee
> Is thrown by Wa-be-no-ka brave ;
> The Iroquois, with demon glee,
> Drags Ko-ko-ko-ho to the wave" (p. 424).

But we must pass to other themes, only remarking incidentally that late researches prove the Indian race not to be dying out after all, so that Mr. Bishop's epic may yet prove only the precursor of a long line of similar octavos.

'Leedle Yawcob Strauss, and other Poems,' by Charles F. Adams (Boston : Lee & Shepard), is a volume differing from Mr. Bishop's in this, that it is intended to be funny, and loses through that evident design. It is the unconscious humor that is irresistible. This book contains many short poems, mostly in German dialect ; it is copiously illustrated, and has a portrait of the author, who thus visibly disclaims identity with an eminent statesman bearing a similar name. We should predict for this book great popularity in England, where every American book that exhibits a grain of fun is caught up eagerly for some railway library of "American Humor." Since these collections already cover the whole range from 'The Autocrat of the Breakfast Table' to Josh Billings, it would seem hard if there were no place for little Jacob Strauss.

'Album Leaves,' by George Houghton (Boston : Estes & Lauriat), has the rare merit of containing not a single poem that extends to more than a single verse. Both this and 'Verses by L. B. T.' are thin volumes of quiet rhymes, printed doubtless "by request of friends," and not also inspired, let us hope, by that hunger which Pope couples with such requests as a twin motive. 'Poems of the Old South, illustrated' (Boston: W. F. Gill), is not a book to fire the tardy zeal for the preservation of that relic ; for though it contains two or three good poetic names on its title-page, yet neither poetry nor illustrations can be said to rise much above mediocrity. But when we remember how few really good lyrics were called forth by the war of the Rebellion, why should we expect more from the pending contest for the Old South ?

There is a tendency in this country to the production of long and rather ambitious poems. Mr. S. P. Putnam's 'Prometheus' (Putnam) has really something of grandeur in its conception, but is crude and unequal in execution ; and one has to turn back, every now and then, to the preliminary "argument" for the key. We there find that "in the evolution of Life Jove represents the beginning of the power of Free Will, but Free Will seeking solely self-aggrandizement. Prometheus symbolizes Moral Insight ; Venus, Asia ; Apollo, Love, Reverence, Imagination without Moral Insight." The scope of the poem suggests Horne's 'Orion,' which had, however, a single fine line in it. That would be too strong an expression to apply to this book ; but it has some fine thoughts, and that is saying something.

'Angelo,' by Stuart Sterne (Hurd & Houghton), is an effort less ambitious than the poem just mentioned, and is more successful in proportion. It is founded on the loves of Michael Angelo and Vittoria Colonna, and shows much power in conception and execution. The tone is pure and noble, though the great sculptor sometimes laments his fate in too many words, and the heroine, on one occasion, tells a lie with too great facility. The versification is commonly smooth, though too often broken by halting lines, like these :

> "From off Marietta's pretty lips, like to" (p. 63).
> "The lustre of her golden hair, shading" (p. 32).
> "Others bending their swifter steps in haste" (p 6).

The action goes clearly and resolutely on to its climax, with few conceits or ornaments by the way ; and the most graceful special passages

grow directly out of the main narrative. Thus, it is the sudden interruption of Vittoria's approach that makes Michael Angelo's hand tremble, and gives us this glimpse at the artist's work :

> "He swiftly put the quivering chisel down,
> Lest one more stroke, too hastily made, should turn
> The delicate moulding of the Cupid's lips—
> That looked as from sweet flowers they just had sipped
> Fresh dew and honey, and curved gently upward
> As with the sunny smile of happy dreams—
> Into the downward lines of drooping sadness" (p. 79).

The newspapers say that "Stuart Sterne" is really Miss Gertrude Bloede. Be this as it may, this writer has certainly given evidence of real poetic power, but is likely to suffer, like all our younger poets, from winning praise too easily.

It is impossible not to feel respect for the dramatic poems of Mr. Edwin Leighton, jr., they are so honestly and faithfully worked out, and show withal some such genuine traits of dramatic power. In 'At the Court of King Edwin' (Philadelphia : Lippincott), as in 'The Sons of Godwin,' there is a strong and well-devised plot, and we are led along, step by step, with real interest. But the interest is mainly in the plot itself ; the speeches are sometimes dull, the wit is not brilliant, there are few original images or detached thoughts, and there is, indeed, little to help us by the way. All this suggests the doubt whether it is a safe thing for even a man of ability to begin with long poems, instead of first training hand and ear by shorter ones. The name of the book naturally recalls Sir Henry Taylor's 'Edwin the Fair.' The king is a different Edwin, and there is a difference of a few centuries in the period ; yet a comparison is possible. There is really a stronger grasp in the American poem, but in all other respects it is inferior—less readable, less varied, with fewer special passages to enjoy ; while the lyrics, which in 'Edwin the Fair' are fresh and graceful, are here tame and wooden. We should be inclined to prescribe to Mr. Leighton a studious cultivation of the lighter aspects of his art, even if this involves abstinence, for the present, from long dramatic poems.

We have from England a little volume whose thoughtfulness and grace might well merit a wider fame than the author has yet attained. It is 'A Sheaf of Verse,' by Henry G. Hewlett (London : King). Among the most attractive of these poems should be named a series of twelve sonnets on the twelve months, a poetic calendar, which, being based on the English climate, may be said to make the best of extremely poor materials. In dealing with June the author has greater advantages, and we quote that sonnet :

> "JUNE.
>
> "An English wife, whose passage o'er the line
> That severs maid from matron leaves its trace
> In wiser innocence and chastened grace ;
> With queenly eyes, love-loyal, frank, benign,
> That warm unheating, and unglittering shine ;
> A touch of cool, bright color on her face,
> A shape that curves half hide and half define—
> Figures our June, the summer's resting-place.
> Promise is perfected without excess ;
> The leaf fulfilled, the bud not overblown ;
> The beams of noontide in this kindly zone
> Bless and burn not ; half-tints of pink and pearl
> Shimmer from wild-rose cluster, woodbine-whorl ;
> The wavy woods are dim for leafiness" (p. 40).

Another book to which one can turn with hearty pleasure bears the rather quaint title 'Firm Ground : Thoughts on Life and Faith,' by George McKnight (Sterling, N. Y.) There is something strange and refreshing when we receive from a quiet country village, without the aid of any city publisher, a book so rich in thought as this. The author is understood to be a young physician. The mottoes to his hundred sonnets show him as a reader of the best authors, but his thoughts are absolutely his own. In his series of sonnets he has worked out many of the hardest problems of the age, and always with a sweetness and candor that win our love ; while his bold touches often carry us to the very heart of thought, though with a perpetual tendency to the larger and more hopeful view. And sometimes, though more rarely, there are really fine imaginative touches, as in the following sonnet, which will bear much study :

> "DEATH THE RENEWER.
>
> "'Twas in far ancient days it did befall :
> The forms of Nature, filling all the space
> Of their abode, had lost their youthful grace ;
> The years were sadly withering great and small.
> And when the gods met in their council-hall
> To choose out one among their mighty race,
> Who should renew the faded earth's wan face,
> None could perform the task among them all—
> So strictly do the laws of Fate restrain
> Each to his proper work—save one alone ;
> Death felt the arduous duty was his own.
> Therefore, the sacred synod did ordain,
> And for all time was passed the high decree,
> That Death thenceforth should the Renewer be" (p. 70).

It is easy to say of Mrs. Louise Chandler Moulton's poems (Boston : Roberts) that their prevailing tone is of monotonous and tender melancholy ; but there are few ballads of the war as genuine and touching as "A Woman's Waiting" ; and among the more personal poems there is a great range of excellence. Some seem merely literary and almost artificial, while in others it is impossible to mistake the real human emotion. The lover in the poem of "Looking Back," for instance, is so painted in four lines that he becomes a real person to us ; and the sudden stab of the last couplet deals his death-blow :

> "LOOKING BACK.
>
> "I may live long, but some old days
> Of dear, deep joy akin to pain—
> Some suns that set on woodland ways
> Will never rise for me again :
> By shining sea, and glad, green shore,
> That frolic waves run home to kiss,
> Some words I heard that nevermore
> Will thrill me with their mystic bliss.
>
> "O love ! still throbs your living heart—
> You have not crossed death's sullen tide.
> A deeper deep holds us apart ;
> We were more near if you had died—
> If you had died in those old days
> When light was on the shining sea,
> And all the fragrant woodland ways
> Were paths of hope for you and me.
>
> "Dead leaves are in those woodland ways—
> Cold are the lips that used to kiss :
> 'Twere idle to recall those days,
> Or sigh for all that vanished bliss !
> Do you still wear your old-time grace,
> And charm new loves with ancient wiles ?
> Could I but watch your faithless face,
> I'd know the meaning of your smiles" (p. 73).

Mr. Stedman's new volume, 'Hawthorne, and other Poems' (Osgood), shows that careful literary execution which should always win the respect of contemporaries, even while the poet's place in the hierarchy of genius is yet undetermined. The ode on Hawthorne, especially, is a brave flight of song, and has many touches of eloquence and of careful discrimination. It labors under that slight flavor of remoteness and out-of-placeness which seems now almost inseparable from the form of the ode. Hard as it may be to say why this particular mode of literary structure should grow obsolete, there is always a vague suspicion of the fact. This mars the reader's satisfaction, as when reading a poem in hexameters. After all there is a sense of relief in turning to the minor poems, although none of them may in this case yield quite so much as the ode. The most musical lines in the volume are doubtless to be found in the "Song from a Drama," beginning

> "I know not if moonlight or starlight
> Be soft on the land and the sea,
> I catch but the near light, the far light
> Of eyes that are burning for me" (p. 86).

This gives a hint of Swinburne, but it also recalls a song of Mr. Stedman's own, which appeared in an earlier volume, and far surpassed Swinburne in delicate and tender feeling—the song called "Stanzas for Music" and beginning

> "Thou art mine, thou hast given thy word."

That song is, to our thinking, the high-water-mark of this poet up to the present time. It should be added, in respect to the volume before us, that it gives several specimens of Mr. Stedman's translations from Homer and Æschylus, and they exhibit so much talent in that direction as to increase the regret that his version of Theocritus remains unfinished.

But, after all, when we turn from the best of these other volumes to the collected poetry of Holmes (Osgood : Household Edition) we may well profess to have come back to "firm ground" once more. Here is at least a secure literary foothold : effective execution, inexhaustible wit, and tact that rarely fails. The extraordinary brilliancy that has now for a half-century kept this author's occasional poems and *vers de société* above all other American work of the kind—finding in England no rival except in the short-lived career of Praed—still holds its own unquenched, as the recent Whittier dinner showed. The only source of regret is that these delightful trifles have now so multiplied that in turning the leaves of the volume we find the more serious poems almost submerged, though it is after all on those that the solid fame of the poet rests. Lowell once wrote of Pope : "Measured by any high standard of imagination, he will be found wanting ; tried by any test of wit, he is unrivalled." This limitation can never be justly made in the case of Holmes ; but the hasty or careless reader of this book might be disposed to make it. He should, indeed, read the book carefully twice ; once for the humorous poems, and again, leaving them rigidly out of sight. He will find in the smaller series of this winnowed selection a wealth of imagination, of beauty, and

of tenderness. Among all these serious poems, we suspect, "The Chambered Nautilus" will stand out as conspicuous as Bryant's "Waterfowl" on the pages of that older poet; and had Holmes written as little as Bryant his reputation might have been as great. It seems a hard decree, but an author's fame, after all, depends hardly more on what he gives than on what he withholds.

Report of the Commissioners to Manage the Yosemite Valley and the Mariposa Big-Tree Grove (1877).—Within the limits of sixteen pages Mr. Ashburner, the Secretary of the Commission, gives a succinct and clear account of the discovery and occupation of this far-famed valley, of the establishment of the reservation, the origin of the commission, and a history of its troubles in securing possession. To these we need not now refer, possession being at length complete, and the faithful guardian from the first, Mr. Galen Clark, in charge. The Commissioners now "desire to secure the services of a competent engineer—one familiar with the laying out of parks—for the purpose of having a careful survey and plot made of the Valley, with reference to its being gradually improved according to some definite plan. On this plot roads and trails which might be necessary in the future would be laid down, and reservations made for hotels, stores, and other houses where they would least interfere with the landscape and beauty of the Valley." They also propose that the private rights in the trails, upon which heavy tolls are now charged, should be bought up; and every visitor to the Valley will agree that this is desirable.

As the Commissioners intimate that the task, which they have well fulfilled to the limit of their ability, has been a somewhat thankless one, they may not favor a proposition for the increase of their charge. But as we note that the "Mariposa Big-Tree Grove" has been managed without anxiety, we are bound to suggest the establishment of two other small reservations of a similar kind. These are: 1, of a square mile or two of *Sequoia gigantea*, or Big-Tree forest, in the King's River district, where these gigantic and unique trees, instead of occurring in detached and very limited groves, intermixed with and much outnumbered by other trees, are said to constitute whole forests. A patch of this forest ought to be sacredly preserved. Considering their situation, and the great and ever-increasing demand for lumber, it is probable that these forests will soon be attacked, and in time share the fate of their kin the Redwood. 2. Not many years ago a similar reservation of Redwood, *Sequoia sempervirens*, could have been secured, almost in the neighborhood of San Francisco, without expense or conflict with any private interest. Now, all the most available forests of this noble tree—second only to the Big Tree of the Sierra Nevada in hugeness, and superior in beauty—have been appropriated, and the process of demolition is fearfully rapid. It would be useless, and indeed senseless, to complain of this. The lumber is most valuable and is much needed. Still, by going farther north, to the interior of Mendocino Co., or even to Humboldt Co., large tracts of unappropriated and magnificent Redwood forest may be found, a square mile of which could well be spared for the purpose now, and would be an inestimable bequest to posterity. Will the Big-Tree Commissioners, or the State of California, take this matter in hand?

Fine Arts.

ELEVENTH EXHIBITION OF THE AMERICAN WATER-COLOR SOCIETY.

I.

ALREADY this young and enthusiastic society, in the dozen years of its existence, has conquered a place of note in American, and we may say in international, esteem; for its members and their works have forced the attention of certain intelligent explorers among the French and English and Italian connoisseurs, and commanded that sort of curiosity which in matters of civilization is victory. When an expert out of the earliest water-painting school in Europe declares, without a thought of flattery, that our Society is more advanced than his native Society—as a London expert readily did on the opening night—it is at least a sign that the time has come when we can invite comparative analysis. The fact is that the eclectic study which has been the habit of this generation of our artists tells much sooner on a light and rapid mode of painting than on a more solid one. The pictures which we are beginning to put in our churches, the statues and historical pieces which our Government and our States are beginning to command, and our more elaborate easel-pictures, are still very lacking in Americanism, in solidity and vigor. But in the kindly opportunity offered by water-color painting we already display very gracefully the American quickness of taking a hint; and our artists, who have long been acutely conscious of all that was best in the practice of the various foreign schools, are now able to reflect directly the lustre of the best teaching with a sincerity which the absence of any clannish *parti pris* has but helped enormously.

It is true that our water-color painters are so few in number that they are obliged to admit many contributions of a low standard in order to eke out an exhibition; but the difference in style between the handful of genuine students and the conventional workers who exhibit alongside is so great that the practised eye can treat the impertinences of the latter almost as if they were invisible, and the successes of the real artists are frequent enough to give a prevailing tone that quite dominates the exhibition.

Perhaps no contributions have had quite so much *éclat* this year as the absence of certain contributions. The always-unexpected Mr. Homer, so certain to do something that nobody could have anticipated and that no inferior artist could do, this season does nothing. He produced last year some powerful effects of the blotchy order, some abrupt eulogiums of Japanese fan-painting, some cries of irreconcilable color, that excited the liveliest attention of the public. We believe that none of those who so readily celebrated the originality of these striking works expressed their gratitude by acquisition, and the leader of the invading school has withdrawn into his tent to ponder on the bad faith of the champions of bric-à-brac. Certain foreign contributors, however, have planted the standards and the disturbed colors of the orientalists, and the Exhibition does not quite lack the peculiar and stimulating accent which it was the wont of Mr. Homer to confer on the yearly display.

We observed among the saving works of the Academy's collection the pure and healthy landscapes of R. Swain Gifford. "The Salt Vats at Dartmouth" (258), by this artist, are painted with a direct, transparent, temperate vigor that is the merit and the justification of water-color. The atmosphere, apparently represented by one uncovered sweep of the brush, is exquisitely fluid and breathable. The sense of uncontaminated open-air nature wraps the whole picture. Aquarelle here seems to resemble the photograph in its contempt of half-measures, its direct fidelity to what is in the field of vision, and its just poise of values. The color is of wholesome sweetness, and the composition, in which the tent-like sheds of the salt-works make a pyramidal series over a low sea-side plain, has a quaint charm. A similar easy sincerity distinguishes the little idyllic bit, "Early June Day on the Coast" (442); here is simply a squarish bowlder under a bush; but the sun which is warming it is the real June sun struggling with coolness, and the winnowing air is potable. Art thus understood is like those systems of philosophy in which matter does not exist in its own solidity, but in our sensations. For the painter, such a rock, such a tree, and such a cloud-sprent sky are not evident by their substance, but by their privilege of expressing the diaphanous fluidity of light and ether. A falser theory of art would have cleared away the air and arrived at their hardness. Mr. Gifford also sends a composition, a Venice scene (17), in which the intention to give pleasure is more evident, more deliberate. In this vibration of fluttering painted sails, and bubble-like cathedral domes, and soaring campaniles, and bronze lion-wings, all melting in the warm gold of a Venetian afternoon, his painting shows the deliberate voluptuousness of a true Venice collegian. The picture seems to want to suggest all it can, and to tell of the colors of Veronese and Robusti that are behind the walls of the Ducal Palace. There is a sense of apparatus; but the ambitious dash towards a more complicated satisfaction of the color-sense is well taken; the painter's strength does not fail him, nor trip itself up, in the more pompous work. In the elaborate "Venice," as in the dewy Yankee landscapes, there is perfect self-possession and singleness. In all his pictures of this year the artist seems to lay, if we may so express it, the thin peeling of painted air which defines what we see of an object in its purity upon the paper, without any linings, thickenings, or patches.

Mr. Richards, astonishing as his trained hand ever is, can hardly be said to show at his best in the large colored boards he has latterly been covering. The Conanicut coast-view (363) will serve as an instance of

what we mean. It is a surprisingly clever piece of scene-painting; it was executed in four days, though the dimension—some five feet across—would seem to demand weeks of toil when the precision of the workmanship is taken into account. There is a secure determination towards largeness of stroke, along with a studied composition and a careful focussing of the high-light. The result is a fine drawing, decidedly hard. Mr. Richards gives no evidence of succeeding in dashes at grandiose landscape in the style of a Rubens. The admiration of his spectators has never been fascinated by feats of grace, or intoxicated by feats of vigor, but rather educated by feats of microscopy. In his greater works the wrinkled hills of the middle ocean have been diagrammed and protracted and surveyed, as they are by the instantaneous photograph. This scientific method of analysis is what has made his fortune. His hand, a little cramped, or perhaps, rather, free within definite restrictions, will not soon become graceful or flowing. Enormous ability is shown, it is true, in great solid cartoons like the "Conanicut." But it is a burgher-like and commonplace prospering; the happy surprise which the spectator would get from inventiveness and fire is altogether wanting, while inventiveness and fire are just what is demanded in great feats of strength executed in four days. His little "Coast-view" (170), with a wrinkled sea perceived far beneath the feet, its crape-like surface furrowing in finer and finer corrugations, while the burnishing path of the sun obliterates their roughness in the middle portion and contrasts with the craggy rocks in front, is in the vein for which this artist has always been admired, and will please the whole of his large and faithful following of disciples.

Concerning a picture so careful, and we do not hesitate to say so fascinating, as Mrs. Stillman's "Bloom-time" (66) the critic of flesh-painting hardly knows what he had better write. This work, a life-sized figure in a certain system of surroundings, contradicts the paint-methods by which flesh is represented, with a sort of diametric opposition which shows that it is not a case of ignorance or inability but of conflicting theory. The well-known means by which the facts of anatomy are expressed, the support of bone and muscle asserted, the illusion of solidity conferred by vigor of tones, are absolutely ignored. There is no effort to get the different features on different planes, no attempt to get the embowering blossoms at different degrees of distance. It is a transparency of a head on an enamel of apple-flowers. And yet it is a painting which betrays poetry, spiritual exaltation, intellectual vigor, and the charm of cultivation. What, in fact, lends a charm to this decorative manipulation is the sense that the artificer has thoroughly saturated her fancy with the work of the early Christian fresco-painters, the "master-mosaists," the glass-stainers, and by a supreme effort, which is itself a sign of power, has cast off like a slough the erudition of art that has grown upon us since those fresh days and seized us like a possession. This study repeats the poesy of thought, as well as the complete technical innocence, of Orcagna and Gozzoli. It appeals only to travellers, to a curious élite, to a corner of cultured cognoscenti. But since it really does transfer the look of things that attracts us in the works of art's delicious infancy, the painting has a searching charm like a page of music played by one who has a right to play it because he has found it out in its organ-loft.

A DICTIONARY

OF

Music and Musicians

(A.D. 1450–1874),

BY EMINENT WRITERS, ENGLISH AND FOREIGN.

EDITED BY

GEORGE GROVE, D.C.L.

The want of English works on the history, theory, or practice of music or the biographies of musicians, accessible to the non-professional reader, has long been a subject of remark. Of "Methods" and special text-books there is no lack, nor of dictionaries of "musical terms"; but there is no one work in English from which an intelligent enquirer can learn, in small compass and in untechnical language, what is meant by a symphony or sonata, a fugue, a stretto, a coda, or any other of the terms which necessarily occur in every description or analysis of a concert or a piece of music, from which he can gain a readable and succinct account of the history of the various branches of the art, or of the rise and progress of the pianoforte and other instruments, or the main facts and characteristics of the lives of eminent or representative musicians, or the circumstances attending the origin of their chief works.

Such information the DICTIONARY OF MUSIC is designed to give. It will contain articles on musical history and biography; on the science and practice of composition, and the nature, construction, and use of musical instruments; explanations of musical terms, and general information on modern music since the fifteenth century; the whole arranged alphabetically, and so given as to be intelligible to the amateur, as well as useful to the professional musician. Special attention will be paid to English music. Every effort will be made to compress the articles as much as possible, consistent with their being intelligible and readable. Illustrations in music-type and occasional woodcuts will be given.

Among the Contributors to the Dictionary the following may be named:

Sir Julius Benedict; Joseph Bennett, Esq.; J. R. Sterndale-Bennett, Esq.; Mrs. Carr; W. Chappell, Esq., F.S.A.; M. Gustave Chouquet, Keeper of the Museum of the Conservatoire de Musique, Paris; W. H. Cummings, Esq., the Chapel Royal; E. Dannreuther, Esq.; Herr Paul David; J. W. Davison, Esq.; E. H. Donkin, Esq.; H. Sutherland Edwards, Esq.; C. A. Fyffe, Esq.; Dr. Franz Gehring, Vienna; Rev. Thomas Helmore, Master of the Children of the Chapels Royal; Dr. Ferdinand Hiller; A. J. Hipkins, Esq.; E. J. Hopkins, Esq., Organist to the Temple; Rev. J. Percy Hudson; Franz Hueffer, Esq.; John Hullah, Esq., LL.D.; Mr. W. H. Husk, Librarian to the Sacred Harmonic Society; H. J. Lincoln, Esq.; Charles Mackeson, Esq.; Herr A. Maczewski, Kaiserslautern; Julian Marshall, Esq.; Dr. E. G. Monk, Organist of York Cathedral; Rev. Sir F. A. G. Ouseley, Bart., Professor of Music, Oxford; C. Hubert H. Parry, Esq.; Herr Ernst Pauer; Edward H. Pember, Esq., Q.C.; Miss Phillimore; W. Pole, Esq., F.R.S., Mus. Doc.; E. Prout, Esq.; Herr C. F. Pohl, Vienna; V. De Pontigny, Esq.; Dr. Rimbault; Arthur Sullivan, Esq., Mus. Doc.; Dr. W. H. Stone; H. H. Statham, Esq.; Franklin Taylor, Esq.; A. W. Thayer, Esq.; C. A. W. Troyte, Esq.; Col. H. Ware, Public Library, Boston, U. S.; and the Editor.

To be completed in about twelve parts, issued Quarterly.

Insurance Department,

33 PEMBERTON SQUARE,

BOSTON, Feb. 8, 1878.

To whom it may concern:

The undersigned, Insurance Commissioner, hereby certifies that the following is a true and correct statement of the financial condition, December 31, 1877, of the NEW ENGLAND MUTUAL LIFE INSURANCE COMPANY, OF BOSTON, as shown by a personal examination, made by him and recorded in this Department:

ASSETS.

Real estate owned, market value		
Loans on mortgages		
Loans on collateral	317,050 00	
Loans on policies	9,268 50	
Premium notes	1,527,427 25	
Stocks and bonds owned, market value	8,197,412 78	
Cash in banks	274,372 17	
Special deposit at New Orleans	6,500 00	
Interest and rents due and accrued	223,875 05	
Net amount uncollected and deferred premiums	327,551 44	
		$14,466,920 53

LIABILITIES.

Death losses due and unpaid	$12,000 00	
Endowments due and unpaid	29,838 00	
Death losses in process of adjustment	61,855 00	
Death losses resisted	23,312 00	
Net premium reserve	12,553,850 00	
Distributions unpaid	157,399 74	
Premiums paid in advance, unpaid bills, etc.	7,577 16	
		$12,845,841 50
Total surplus		$1,621,078 63

ITEMS NOT ADMITTED.

Loans secured by renewals	$5,000	
Bills receivable	4,000	
		$9,000

SEAL.

In witness whereof, I have hereunto set my hand, and affixed the official seal of this Department, this eighth day of February A.D. 1878.

S. H. RHODES,

Insurance Commissioner.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 21, 1878.

The Week.

THE debate in the Senate on the Silver Bill was brought to a close on Friday afternoon, and the discussion and voting on the various amendments occupied the entire night. Towards five o'clock on Saturday morning the bill was passed by a more than two-thirds vote of 48 to 21. It provides for the coinage of 412½-grain silver dollars, to be "a legal tender at their nominal value for all debts and dues, public and private, except where otherwise expressly stipulated in the contract," and the Secretary of the Treasury is directed to purchase silver bullion at its market price, not less than two and not more than four million dollars' worth monthly, and to coin it into dollars monthly as fast as purchased, the Treasury to have the benefit of the seigniorage; but not more than $5,000,000 shall at any one time be invested in uncoined bullion, and gold certificates of deposit shall not be payable in silver. It further directs the President to invite the Latin Union and such other European countries as he may deem advisable to a conference for the adoption of a common ratio of gold and silver, and of establishing internationally the use of bi-metallic money, and to appoint three commissioners on behalf of the United States to attend such conference. Finally, provision is made for the issue of silver certificates against deposits in the Treasury or Sub-treasuries of the United States.

The principal amendments rejected were those offered by the friends of honest money. By 46 to 21 the Senate rejected Mr. Morrill's proposal that for the first year not more than 25 per cent., and for the second year not more than 50 per cent., of customs dues should be payable in silver; by 46 to 23, Mr. Edmunds's proviso that the act should not interfere with the coinage of gold and subsidiary silver coins as now authorized by law; by 44 to 20, Mr. Morrill's proposal that payments on all uncompleted contracts should be made on the basis of value represented by United States notes at the time the contracts were made; by 44 to 25, Cameron's 420-grain dollar; by 46 to 23, Blaine's 425-grain dollar; by 49 to 18, Eaton's 440-grain dollar; by 46 to 20, Mr. Whyte's proposal to limit the legal-tender of silver to $20, and, without calling the roll, Mr. Burnside's poor-man's proposal to limit it to debts and dues in excess of $500; by 45 to 18, Mr. Sargent's proposal to except customs dues and interest on the public debt from payment in silver; without a roll-call, Mr. Morrill's proposal to retire and cancel five-dollar greenbacks in equal amounts with silver issues; by 46 to 14, Mr. Christiancy's proposal that silver and gold be interconvertible on demand at the Treasury, and that the coinage of either metal for private parties be prohibited, and subsequently a similar proposal by Mr. Butler, of South Carolina; and without a roll-call, Mr. Morrill's fixing the date of June 30, 1878, as the time for the bill to take effect. Mr. Christiancy's substitute was peremptorily rejected, and Mr. Blaine withdrew his as already hopelessly condemned. The bill as amended in Committee of the Whole was then reported to the Senate, when Mr. Kernan moved to amend by providing for the redemption and cancellation of the one and two-dollar Treasury notes. On motion of Mr. Ferry, reissue was substituted for cancellation by a vote of 42 to 25—a pure demonstration on the part of the anti-resumptionists, for the amendment as amended was then defeated by 54 to 10. This ended the struggle.

Other proceedings in Congress have been of slight moment. The old and tiresome question of what bargain was made by or for the President to prevent the Southerners from filibustering against the decision of the Electoral Commission, and whether his course in withdrawing the troops from Louisiana was due to anything but his previously-formed conviction that it was his constitutional duty so to do, was sprung upon the House on Wednesday week as an incident of the debate on the Military Academy Appropriation Bill. Mr. Hewitt made dark allusions to buying and selling the Presidency, and said he had contemptuously refused a Louisiana offer to sell out to Tilden. Mr. Garfield denied any trafficking or bargaining on the part of Mr. Hayes; and Mr. Foster, the next day, denied again that the famous Wormley House interview involved any pledge on anybody's part, or any written document with signatures. On Tuesday Mr. Hale and Mr. Garfield had a good deal to say about the "persecutions" in Louisiana, and hinted that the Government might feel obliged to interfere. On Thursday there was a ludicrous episode in the House occasioned by a communication from Mr. Sherman in regard to the falling-off in the revenues, as brought to his notice by the Commissioner of Internal Revenue. He accordingly recommended a reduction in the appropriations or an increase of taxation. This constitutional proceeding was resented by Fernando Wood as an attempt to dictate to Congress, and for the hundreth time it was shown how the President and his advisers are regarded by that body as hangers-on of the Government, having neither responsibility to the people nor any representative relations to them. It is one more argument in favor of getting the Cabinet on to the floor of Congress as soon as possible.

The leading speakers in the silver debate in the Senate have been Messrs. Bayard, Eaton, Randolph, Hill, Lamar, Kernan, Blaine, Christiancy, Edmunds, and Morrill, six of them, and the strongest, being Democrats. Moreover, two of the Republicans, Messrs. Blaine and Christiancy, proposed compromises which were simply trifling improvements on the original proposition. Mr. Lamar is perhaps entitled to more credit than any of them, as his vote will probably cost him his seat. He presented to the Senate on Saturday resolutions of the Mississippi Legislature instructing the State Senators to vote for the Silver Bill, which, however, he announced his intention of disregarding, in a short speech which for manliness, dignity, and pathos has never been surpassed in Congress. Any man there might be proud of having made it, and we doubt whether there is anything in the history of Mississippi nearly so creditable as having sent such a man to Congress. We trust, however, he will, since he sets his duty so high above all other considerations, go one step farther than disregard the resolutions, and refuse also to offer his resignation, which we have heard he proposes to do. The country needs now in Congress, as it has never needed them before, men who represent the whole Union, as distinguished from particular States and districts. Senators are in a peculiar degree bound to do so. The Republic at large ought to be their main concern. Owing to the practice of office-jobbing, and the increased dependence of Senators on local wirepullers, this has been almost completely forgotten, and in a crisis like this there is hardly anybody in either House to think and speak for the nation. At such a crisis, too, a man of Mr. Lamar's courage serves his State best by thinking only of the country. But how absurd and quixotic his performance must seem to Blaine and Conkling!

When the question of the appointment of a new Collector of the New York Custom-house was before the Senate in December last Mr. Conkling bore the most prominent part in that great debate. According to his principal newspaper admirer, "he spoke for an hour and a half, and his speech was described by those who heard it as being one of the most brilliant, eloquent, and able of his life"; and "his remarks were divided into three heads." During his speech "he was surrounded by piles of documents; his desk and the chairs

in his immediate vicinity were overburdened with books, papers, and letters." "When he alluded to General Arthur and Mr. Cornell he moved up and down the aisle, and spoke at the top of his voice, and clinched every sentence with violent gestures." In short, all his powers were brought into play; the occasion was great, and the man was equal to it. The revered names of "Arthur" and "Cornell" touched the inmost recesses of a rich nature. We are sorry to say that the account of his demeanor during the debate on the silver bill is not equally interesting. It is described by Mr. Nordhoff in the *Herald* as follows:

"Mr. Conkling's course was in melancholy contrast with that of Mr. Lamar. It was not merely that he did not speak, for he had repeatedly said to his friends he did not think a speech from himself on the subject likely to be effective to change the result, but his studied attitude all day and night of indifference to the speeches and movements of the opponents of the bill, his ostentatious display of contempt for the efforts made to check and limit the bad effects of the bill, and his equally ostentatious zeal in encouraging his friend Mr. Jones, of Nevada, and other extreme silver-men, in their demonstrations, were all so marked as to be the general topic of conversation in the galleries and on the floor. Indeed, he went so far that many persons believed he had made up his mind to vote for the bill, and when he voted no it was felt that he must have gone at last against his sympathies."

The New York *Times* has been making some very sneering and unhandsome observations on him for not making "the great effort" during the silver debate, and has also mentioned very discourteously the fact that after making a "great effort" on the formation of the Electoral Commission he kept out of the way, and did not vote when the Louisiana returns came up for adoption. The *Times* is probably alluding to the cruel though widely-believed story that the Great Citizen had been privy to a little plan for throwing out the Louisiana returns and having himself made President for one year, until a new election could be held, which was abandoned at the last moment. We think we can furnish a much more charitable explanation of his silence in the silver debate, and that is that he was studying "the mechanism of government." "One thing at a time," as the *Tribune* says. Mr. Conkling is no "Dutch theorist," and, therefore, makes sure that the "mechanism" is all right before coming to the discussion of ordinary political questions. As to the Louisiana affair, we think his absence must have been due to some accident to his toilette. His hair was probably tumbled, or his collar had gone awry.

Mr. Bayard Taylor's nomination for the German mission has been received with great and justifiable satisfaction, both as being positively good and as saving us from something possibly very bad. Mr. Taylor is very familiar with the German language and literature, and has had some diplomatic experience already, and is a sensible man who has seen a great deal of life and will serve the country with the highest credit. His appointment, owing to his being one of the editors of the New York *Tribune*, raised a very puzzling problem in "the amenities of journalism." Congratulation of an editor on any honor or reward outside his profession, or commendation of any appointment bestowed on him, may of course be readily construed as a compliment to the wretched or insignificant or infamous sheet with which he is connected, and this his professional brethren are naturally apt to shrink from. The *Times* solved the difficulty in the present case very dextrously by observing that, as Mr. Taylor's appointment was "credited" to Pennsylvania, it showed that Mr. Taylor's connection with the *Tribune* was "purely accidental," and it was gratifying inasmuch as it delivered a man of great intellectual calibre "from the necessity of earning a living by the sufferance of Jay Gould." A neater mode of killing two birds with one stone it would be hard to find.

The suit of the United States against Tilden for the recovery of unpaid income-tax, which Mr. George Bliss brought in the very last days of his District-Attorneyship, and left to his successor to prosecute, has been before the court ever since. The defendant, with his accustomed wickedness, demurred, on the ground that the assessor's estimate, on which the tax was levied in the absence of a return, was final, and that the acceptance of the amount so fixed operated as a complete discharge. This plea has, however, after full argument, been overruled by the court, on the ground that the statute provided that the tax was to be levied on the income, and not on what the assessor said was the income. The case will now be tried on its merits, and we shall at last know what Tilden's income really was between 1862 and 1872. The drawback on the proceeding as a purifier of public morals is that it was begun simply as a means of annoying a political opponent in a canvass, and as his chances of again being a candidate are small, it is very doubtful whether it will ever be pushed to a conclusion.

Colonel Bob Ingersoll has lately occupied a good deal of attention in this city, and evidently furnished the theme to a great many metropolitan preachers, for an inordinate number of discourses on the Sunday following his lectures were on Hell, and one minister addressed himself to Colonel Bob directly and castigated him severely. The Colonel's first lecture on this same subject was a great success as far as numbers went, was reported in all the papers, and even reproduced in pamphlet form, and consisted of a droll stump-speech directed against the Christian religion. Encouraged by this he engaged the Hippodrome and made preparations for an audience of several thousands to hear him on Ghosts, but only about two hundred assembled for that purpose. The fact is that, looking at the matter from the business point of view, he ought to have reserved Hell for his last lecture. All other subjects will seem to his audiences who have enjoyed that, like thin claret to a man who has been regaling himself with apple-jack. There is, perhaps, nothing in recent history more curious than the Colonel's rise as a great theologian and the foe of theologians, considering that he passed middle life unknown to fame, and then made his mark by unsuccessfully proposing a doubtful candidate at a nominating convention. The lectures are a rehash of Tom Paine's, Voltaire's, and Theodore Parker's well-known arguments, with an intermixture of Western humor and the usual mushy eulogies on Love.

When it became known that the Senate had, by more than a two-thirds majority vote, passed the Silver Bill, retaining the provision for paying U. S. bonds principal and interest in 412½-grain dollars if the Government shall elect to make such payment, the price of gold in New York fell from 102⅜ to 102, and later to 101⅝; U. S. bonds advanced ¼ to ⅜ per cent., and in London ¼ to ⅜ per cent. (leaving them, however, ⅛ to ¼ below New York prices). By a looker-on in the markets it might have been inferred that the Senate had done something which was not only harmless, but of positive benefit to the credit of the Government. There is, however, such a thing as "manipulation" in the Stock Exchange markets on both sides of the ocean, and in the absence of any adverse speculation a show of sentiment favorable to the Silver Bill might have been brought about at no greater cost than a few brokers' commissions and the risk of a moderate amount of money. If the President, who has rested his opposition to silver remonetization on considerations of the public credit, could be persuaded that the bill would not only not injure the public credit, but would help it, such an outlay as we have spoken of would be a judicious investment. It is true that as the bill passed it was shorn of the free-coinage section, which would have brought silver here from all parts of the world, to be stamped as possessing a value 10 per cent. above its actual value; that an International Conference, after the act goes into operation, was authorized; and that the issue of 412½-grain dollars was restricted to $4,000,000 per month. But with all these modifications the bill contained its repudiating feature; that is, it gave force and, so far as a statute can do it, effect to the declaration that the U. S. Government will save to itself 10 per cent of what it owes. The fact that it cannot begin on this saving at once, and that possibly before the time comes when it can pay silver dollars they will be more valuable than now, does not alter the repudiating intent of the

bill. Whatever the temporary effect of the bill on the markets ought to have been, its ultimate effect on the public credit cannot be doubted. Silver in London advanced to 54½, and closed at 54⅛ to 54⅜. Here the gold value of a 412½-grain dollar advanced from $0.9010 to $0.9063; the gold value of the "paper dollar" (the promise of the Government to pay one dollar) ranged during the week between $0.9768 and $0.9840.

If the bill shall become a law, the 412½-grain silver dollars will be bought by importers to use in paying duties at the Custom-house. For this purpose they can afford to pay .99 to .99½ for them; to the extent that they can be got will they be used for this purpose, and to that extent will all the coin receipts of the Treasury be in silver. For a while the Treasury will pay its interest in gold, but a time will come when the coin it will have will be silver. Then the fact that the bonds are silver obligations will be brought home to every holder of them. If silver shall then be 59*d.* per ounce, it will be the same to the holders as if they received gold, but to the silver agitators it will be a reason for another hostile movement on the "privileged class" which has savings to invest. If silver by that time shall rule below 59*d.* per ounce, then the bondholders will be the sufferers.

The London *Times* discusses the cause of the slight rise in United States bonds on the receipt of the news of the passage of the Silver Bill, and ascribes it to the stimulus given to the market by the report of better New York prices, and by the fact that the worst was now known, and proved not to be so bad as was feared. We are inclined to think, however, that the soundest explanation is that given by the New York *Herald*, which is that as the passage of the bill will permanently stop refunding at four per cent., it raises the value of the outstanding six per cents. by making it sure that they will not be called in, inasmuch as six per cent. in silver will, doubtless, be better than four per cent. in gold. Persons proposing investment in the West cannot be too cautious. The talk of a compulsory reduction in the rate of interest on outstanding loans has already begun, and in Illinois there are the first notes of clamor for a stay law. In fact, nobody can tell in how many new forms the swindling spirit will show itself during the next year or two.

The historian Sybel has published a pamphlet on the financial and commercial situation in Germany entitled "What We May Learn of the French," in which he publishes the Paris stock-list beside that of Berlin. There appears a terrible decline in the securities quoted in the latter this year, as compared with 1872, being little if any short of $1,000,000,000, while the French have escaped almost unscathed in spite of their enormous losses through the war. One of the latest German jokes is, "What shall we do to the French if they seek revenge and attack us again? Pay them $1,000,000,000." Von Sybel ascribes all the trouble to the Chinese apathy of the Germans, their want of national feeling, their want of confidence in the future of the country, and their passionate and unbridled political divisions. He makes no mention of the demonetization of silver, being probably a "gold-bug," "goldite," "money-sharp," and "Shylock." In fact, we believe there is no doubt the unconscionable knave has a little property.

The error of the threatening and distrustful policy pursued toward Russia by the British Ministry has been brought out very clearly by the first attempt to protect "British interests" by force. The entrance of the fleet into the Dardanelles caused the greatest anxiety in London, because there was every reason to fear that if the Turks and Russians joined hands it would never get out again, and the humiliation of its loss or capture would have been incalculable. Then the attempt of a power which had no army to fight with a power that had no fleet and a very large army, fifteen hundred miles from home, began to have a very ludicrous aspect when the time for action came. That England is not ready to go to war, that she has no army, and that the recently-voted £6,000,000 will have to be used not to mobilize but to enlist and equip men for the field, is now freely acknowledged. The *Times* says that the officers are not familiar with mobilization; ambulances, transports, and medical organization are all wanting; and admits that all that Sir Stafford Northcote can do with his £6,000,000 is to shake it in the face of the Conference. By scraping together her whole available force, not over 30,000 effective men could be sent to Turkey, and there they would be reinforced by 30,000 or 40,000 more of the dregs and remnants of the Turkish army; and with this the job of chasing 300,000 Russians out of Rumelia would have to be undertaken. It is difficult to avoid the belief that when the exact nature of the situation dawns on the public in England the Ministry will find it impossible to maintain themselves.

The course of the Anglo-Turco-Russian complication is still obscure, but it seems to have re-entered on a peaceful phase, leaving England again in a somewhat worse diplomatic position than before. Her first error was in treating the Russian desire to command the Turkish line of defences at Tchadallye, twenty miles from Constantinople, as proof of an intention to occupy the city itself. Considering that Suleiman Pasha had escaped to Rodosto with thirty thousand men, and that the capital was occupied with a large body of armed refugees, and that the Turkish communications with Asia were open, there was nothing exorbitant in seeking to preclude the possibility of a renewed and desperate defence of the last Turkish line; and the march of the Russians on Gallipoli, which produced such a panic in London, is now acknowledged to have been due, and to have been directly ascribed by the Czar, to Suleiman's concentrating behind the works of that place. With a little reliance on Russian good faith, therefore, the fleet would not have been sent up to Constantinople under the pretence, at which everybody now smiles, that it was going to "protect the Christians." It was sent up, however, in defiance of the Sultan's prohibition, and this breach of the Treaty of Paris having been committed by her rival, Russia promptly withdrew her threat of occupying either the fortifications or the city. Austria, which showed some signs of irritation, was at the same time calmed down by Bismarck, who came forward at the moment for which he has probably long been waiting, and made everything between her and Russia so pleasant as to leave England once more out in the cold, and to provide for the meeting of the Conference at Baden-Baden probably, but somewhere certainly, within a few days.

Bismarck has at last appeared in the Reichstag, and, in reply to an "interpellation" about the Eastern question, spoke with a calmness and indifference which must have appeared very provoking in war-circles in London. The situation as described by him is in every way satisfactory. Russia, he says, has done nothing wrong, and means nothing wrong. He said there was no cause for anxiety about the Dardanelles or anything else. There would not be any general war. It was Russia's interest to satisfy Austria and England for the sake of future peace and quiet, and Austria and England must take the responsibility of the legacy left by Turkey. The Conference would meet early in March, and would settle everything. In any case, nothing would induce Germany to fight in this quarrel. In the Austrian Reichsrath and the Hungarian Diet Prince Auersperg and M. Tisza have made statements of somewhat similar character. Austria would not consider any arrangement between Russia and Turkey binding which had not the sanction of all the Powers, and, while willing to agree to everything which would ameliorate the condition of the Christians, must object to anything which seemed likely to alter the balance of power in the East to the detriment of Austria. But a Conference would settle everything. In the meantime the insurrection in Thessaly is spreading, and Servia is making loud claims to the benefit of the *uti possidetis* rule, by holding on to her conquests in Turkey, and says she will only surrender them to superior force.

"THE FATHERS" AND THEIR DOLLAR.

THERE has been nothing more prominent in the talk of the silver-organs during the last three months, and nothing duller or drearier in their mendacity, than their iteration that their "fathers" used the silver dollar as their standard, and that it was taken away from them in 1873 by the Coinage Act, and that what they seek now is to have it restored to them. We believe, however, that, with their too common dishonesty, they have carefully refrained from publishing any figures on the subject, being well aware that the facts of the matter, if known, would make the theory of "the fathers' dollar" as ridiculous as the theory that the Coinage Act was passed secretly. The facts are that, from the establishment of the mint and the issue of a national coinage, in 1793, down to 1836, a period of forty-three years, only $1,439,517 silver dollars were coined. At the first-mentioned date the population was, in round numbers, 4,000,000; and allowing one "Father" to each five persons, which is the usual calculation, there were in all 800,000 Fathers, so that they started with less than two silver dollars apiece—or, if we suppose them to have divided with the Mothers, they each had less than one dollar. The Fathers and Mothers, however, went on increasing, while the silver dollars did not, for, strange to say, there was no demand for them. The whole $1,439,517 had been issued before the year 1805, and from that year until 1836 not one was coined. In 1810 the population had reached (in round numbers) 7,000,000, and the supply of dollars remained the same, so that there were 1,400,000 Fathers, and only about one dollar each for them, leaving none for the Mothers. In 1820 the population was 9,000,000, and there were 1,800,000 Fathers, so that there were 300,000 Fathers who had no dollar at all, and the prospects of the Mothers were more hopeless than ever. In 1830 the population was 12,000,000 (it was nearer 13,000,000, but we are throwing off the odd figures), and there were 2,400,000 Fathers, so that there were 900,000 without a silver dollar. In 1836 relief came, and yet very slight relief; for but a few dollars were coined every year, so that only $6,606,321 were issued between 1836 and 1873, and the greater part of these after 1860. In 1860 the population was 31,000,000, and—many people who have been listening to the tuneful silver-man will scarcely credit it, but it is nevertheless true—the amount of silver dollars which had been coined up to that time (we do not say they were in circulation, or even in existence) was only $2,827,320. Supposing them, however, to have been all in circulation, there were 3,372,680 Fathers who had not one silver dollar in the world, and 2,827,320 who had only one dollar each. The Mothers had none, nor the grown-up Sons and Daughters; of course the Aunts and Uncles were equally destitute.

How, then, it will be asked, did the Fathers carry on their business? What did they settle their accounts in? If the silver dollar was the dollar of their hearts, why did they not clamor for more silver coinage? Well, the fact is they carried on business in *gold*, or in bank-bills redeemable, or supposed to be redeemable, in gold. In short, they were "goldites," "gold-bugs," and "gold-sharps." This is a sorrowful truth, but truth it is. The official records do not lie, strange as it may seem to some gentlemen out West, who have lately been lying much, and to whom it probably seems natural that everything and everybody should lie. The Mint from the very first year began coining eagles, half-eagles, and quarter-eagles. It issued eagles every year down to 1805, when it stopped until 1838. It issued half-eagles every year except 1816, 1817, down to 1873—the year of the "conspiracy"—and has issued them every year since. It issued quarter-eagles every year down to 1808, when it stopped until 1821, and then resumed; paused again until 1824, and then resumed once more, and has continued ever since. In 1850 it began coining gold dollars; in 1855, three-dollar gold pieces. We finally come upon the damning fact that before the year 1873 the Mint had coined and issued $816,422,042 in gold, against $8,045,838 in silver dollars. We take no count here of the small silver "change." Of course there was a good deal of that issued, say $150,000,000; but this does not furnish a standard of value or a means of carrying on the trade of the country, being merely used for small purchases. So that what the silver-men would have us believe, although the more intelligent and rational of them do not believe it themselves, is that while the United States were growing from a nation of four millions to thirteen millions, and increasing their trade and industry in an unprecedented ratio, they carried on business with a standard composed of one million and a half of silver dollars, and that they rose into a nation of forty millions, with a corresponding increase in wealth, on a basis of eight million silver dollars; and that the eight hundred million dollars coined in gold during this period were a mere luxury; and, finally, that when silver was demonetized in 1873, none of this eight millions being in circulation and very little of it in the country—even the small change being all gone—it helped to bring about the great decline in the value of silver which began in 1875.

This leads us to say a few words in conclusion about the "standard" of a country as distinguished from its "legal tender." This is probably the only point in the controversy on which the silver-organs, and especially the Chicago *Tribune* and the Cincinnati *Commercial*, have not been guilty of wilful falsehood, and falsehood repeated over and over with dull pertinacity. On this we do not think they have been wilfully untruthful, because we do not believe they have been able to get the distinction into their heads. When you find a silver-editor talking of "standard" and "legal tender" as if they were synonymous terms, and you stop him and point out the important difference between them, he gazes at you for a moment in a dazed, bovine way, and then begins repeating in the same sing-song, "Standard and legal tender, legal tender and standard, all the same." No one, however, who has not got a firm hold of this distinction, and cannot keep his hold of it, ought to open his mouth in public about currency, any more than offer to repair a watch or navigate a ship, never having learnt watchmaking and never having been at sea. The standard of value is a measure, created by popular consensus, which people use—*i.e.*, have in their minds—in buying and selling, and contracting or settling their current accounts. It may be legal tender also, and generally is; but it may not be the *only* legal tender, and sometimes is not. Legal tender, on the other hand, is the money or other commodity in which it is *lawful* for a man to pay or offer to pay his debts, if he pleases; it *may* be also the standard of value in general use, and generally is, but it sometimes is not. For example, in California gold has always been the standard of value. In buying and selling, and contracting and settling accounts, Californians have had gold and gold only in their minds when making their bargains, and have meant gold in their figures. Nevertheless, greenbacks have since 1862 been a legal tender—that is, a currency in which a man owing money to another *might* pay his debts. So strong, however, has been the popular consensus in favor of gold, that any man who attempted to use paper as the standard by availing himself of its legal-tender quality would have been disgraced. So also most or a great many of the foreign merchants in this city have for many years used gold as the standard in all their sales and purchases and contracts, even if they actually squared their accounts in greenbacks. That is, if they paid in greenbacks they did so with gold in their mind, giving greenbacks at their value in gold.

The history of American coinage since 1793 is another illustration of the distinction. Silver was down to 1862 a legal tender as well as gold, but it was not the standard. Nobody had it in his mind in buying or selling except in very small amounts, or in keeping his accounts or making contracts *de futuro*. What every one meant and thought of in talking of prices was prices in gold. He may have paid in bank-bills or checks, but they were checks or bank-bills redeemable in gold. He did not think of silver, or call for it; had he done so, of course it would have been coined and brought into use in large quantities. All this time silver was a legal tender; that is, a man might, if he pleased, have paid any debt in it, just as during the last fifteen years he might in California have paid his debts in paper; or just as here he might dur-

ing the same period have paid it in gold. So that the truth is, as we have said, the Fathers were "goldites." They used no silver except in small change; they had none to use, and did not call for it. They did all their business for sixty-seven years on a gold basis, and thought only of gold in making their contracts. The standard of the United States, in short, was from the foundation of the Government to the outbreak of the war the gold standard, and there was only *one* standard, although there were *two* legal tenders. Every child ought to have this distinction worked into his head, no matter what time or trouble it may take, and all the grown-up people whose minds are still flexible enough to entertain new ideas, ought to work at it until they grasp it; and until they have done so, especially if editors, keep dead silence about currency questions.

SOME MEMORANDA ABOUT LOUISIANA AFFAIRS.

THE fresh outbreak of excitement about the Louisiana Returning Board seems to show that a good many well-meaning people have forgotten several important things, to which we shall take the liberty of recalling their attention.

1. That it was widely believed, and with good reason, before the meeting of the Electoral Commission, that the Louisiana Returning Board had been guilty of fraud, and that no one could take the Presidential chair with a satisfactory title who owed it to the discretionary counting of persons in whom so little confidence was felt as the members of that body. The great reason for rejoicing over the appointment of the Commission, and its decision that it could not go behind the face of the returns, was, therefore, not simply that it put an end to strife and turmoil, but that it relieved President Hayes from all dependence on and obligation to the disreputable Republican politicians of Louisiana, and enabled him to repudiate all connection with them and responsibility for them.

2. That it was much to be regretted that he should have unnecessarily renewed or prolonged this connection by giving the two principal members of the Board high offices in the Custom-house, thus giving color to the charge that he was indebted to them, and perpetuating the irritation which their connection with local politics had caused, and, as it were, snubbing the whole body of New Orleans merchants who have dealings with the Custom-house, and who believed both Wells and Anderson to be dishonest. It was rendered the more objectionable by the fact that the Custom-house in that city had long been sunk in far deeper corruption than that of New York City, and stood in far greater need of a reformatory break with old practices and management.

3. That the charge that the prosecution of Wells and Anderson is "a breach of faith" implies that President Hayes withdrew the troops in consequence of some pledge from Governor Nicholls and the Legislature. If, however, they are the lawful Governor and Legislature, they were entitled to the control of the State without any pledge, President Hayes not being an armed invader, but the chief officer of a Constitutional Government, and bound to act in all things according to law. If they were not the lawful Governor and Legislature, no pledge could have justified his surrender of the State to them; so that no matter in what light we regard them, it is very impolitic of the Administration or any of its members to talk of any pledge as having influenced the President's action. To do him justice, he has again and again averred that he did in Louisiana only what it was his constitutional duty to do; and General Garfield, who was one of the "visiting statesmen," has within a week repeated this statement in the House. Consequently, his doing it can have bound no one to follow or avoid any course of conduct.

4. That, in point of fact, no pledge or promise not to prosecute anybody for past "political offences" was, as has been alleged, made either by Governor Nicholls or the Legislature. The resolution of the Legislature promises not "to persecute any one for past political conduct." But legal prosecution is not and ought not to be held to be "persecution," and criminal offences are not "political conduct." The offence with which Wells and Anderson are charged is the offence described in the Louisiana Revised Statutes, "of publishing as true any false, altered, forged, or counterfeited public record, knowing the same, etc., with intent to injure or defraud any person or any body, politic or corporate," and is punishable by imprisonment at hard labor for not less than two or more than fourteen years. By the same statutes, having knowledge of such a crime without communicating it to some committing magistrate or district-attorney is punishable by a fine and imprisonment with hard labor. To cite these statutes is to show the extreme impropriety—to use a very mild word—of the President's claiming any immunity for anybody from their operation.

5. That under the American system of jurisprudence, the proper defence against wrongful or false charge is a trial in open court by a jury under the procedure fixed by the common and statute law; and the only remedy for defects in such procedure, or the misconduct of the judge or jury, is an application for a new trial or an appeal to a higher court. The notion that such protection or remedy is to be found in appeal to the sympathy or gratitude of the President of the United States, or to any other great man, is as novel as it is mischievous, and seems to be borrowed from the practices of the various Oriental monarchies and khanates. It becomes more absurd when the court complained of is a State court, and when the prisoner for whom this extraordinary privilege is claimed is simply a member of a Southern Returning Board. The degree to which the public mind has been bemuddled on this subject is shown by the following passage, which we extract not, as might be supposed, from *Blackwood's Magazine* or the *Kreuz-Zeitung*, but from a leading American newspaper published in the city of Boston:

"It is not believed at Washington that either Anderson or Wells was criminally connected with the alteration of the Vernon parish returns. They will both be found guilty of the deed which they did not commit. If the general Government cannot legally or constitutionally interfere to prevent such a travesty of justice from being executed as the imprisonment of these two men, there is a gap in the practical working of our institutions which should be filled. Probably some way will be found to head off the plots of those who would thus revive old sectional feelings."

It is here forgotten that the belief of persons in distant cities about the value of evidence which they have not heard is of no consequence under American law, and that "the gap in the practical working of our institutions" which prevents the President from revising the decisions of State courts was left there purposely by the founders of the Government, the excellence of which is, indeed, largely due to the number and magnitude of similar "gaps." If the President has had to consult the Attorney-General as to whether he can interfere when he dislikes the result of trials in State courts for breaches of State law, it furnishes a new and strange illustration of the degeneration of our political thought wrought by the carpet-bag régime.

6. That the fact that the State judge who tries an offence was a defaulter before he went on the bench is a proof of great laxity of public morals on the part of the community which elects or tolerates him, and is an evil to be remedied by State opinion; but that the judge's character gives a prisoner tried before him a right of appeal to Washington is a grotesque idea, which has some of the marks of convivial origin. So also is the idea that, though the President or Cabinet would have no right to protest against such a judge trying cases in which they felt no interest, they may lawfully protest or interfere when he tries somebody whom they esteem and believe innocent; the fact being that, if entitled on this ground to interfere with State courts at all, the poor and helpless defendants whom they do not know, have a far better claim to such interference than the rich and conspicuous ones whom they do know. Every man in Louisiana deserves as good a judge as Anderson, and whatever is done to protect one person against such an officer ought to be done for all.

7. That so long ago as 1867 General Sheridan made a report to his superiors in Washington on the state of things in New Orleans, in which he described J. Madison Wells, after prolonged observa-

tion, as "notoriously corrupt," as "a political trickster and dishonest man," and declared "that he had not one honest man among his friends," and he therefore removed him from the State governorship. He also charged him with lobbying an appropriation of $4,000,000 through the Legislature for the repairs of the levees, "in order to finger some of the money himself." That in 1872 the Congressional Committee, after examination on the spot, pronounced the action of this same Wells and Anderson on the Returning Board "arbitrary, unjust, and illegal," and that there is no good reason for believing that either of them has since then grown in grace or improved morally in any department of human activity. That though this may not prove, or help to prove, that they committed the offence for which they are now on trial, it does furnish strong evidence of the impropriety of any attempt to raise the proceedings against them into the rank of a national concern, or plunge the President and his Cabinet into attempts to save them either by means of unlawful acts or unseemly language. Finally, that the practice of telegraphing or writing from great distances that trials which cause you annoyance, or in which a person whom you like or trust is the defendant, are "outrages" or "travesties of justice," is not only un-American but would in any country or under any system of jurisprudence be considered somewhat silly.

PARTY DISSOLUTION AT WASHINGTON.

WASHINGTON, February 18.

THE general impression with regard to the Silver Bill and the veto is that the President has not sufficient influence left in the Senate to secure the one or two votes necessary to prevent the passage of the bill. I do not believe, however, that this is by any means certain. If a determined effort should be made during the next ten days to obtain votes by the President directly, or by Mr. Sherman, there is no saying what might be the result, and many hitherto thoughtful civil-service reformers will probably within that period begin to doubt whether on the whole it is not better to have the effort made to influence the Senate, even at the expense of a little principle, than to trust the credit and honor of the country entirely to the mercy of Congress uninfluenced by the Executive. There is little doubt that a successful veto would be a death-blow to the silver agitators; the process of getting any measure of importance through Congress is so tedious and cumbrous that once blocked it is difficult to begin over again; and the Bland Bill would probably share the fate of the inflation measure vetoed by General Grant, if only the necessary votes to support the President could be found. It is all wrong, of course, to bribe Senators with offers of patronage, and civil-service reform does not lie that way. But then, cynical persons will say, Are we getting civil-service reform? Is it civil-service reform to keep Wells and Anderson in office at New Orleans, and to send McLin to New Mexico, and to offer Arthur a consulship to get him out of New York? Is it worth while, in order to get such reform as this, for the Executive to throw away its control over legislation, and so let Congress ruin the credit of the country? These are questions which just now are passing through the heads of a good many supporters of the President, who sincerely believe in his civil-service policy—as announced. It is a curious illustration of the contradictory impressions the President produces upon people with whom he comes in contact, that there are intelligent men here who will assure you that he will never veto the bill; that he is at heart in favor of remonetization; that the Stanley Matthews resolutions declaring the bonds payable in silver were introduced in order to give him an easy way out of his difficulties, by enabling him to shelter his approval of the Bland Bill behind a recorded declaration of the two Houses on the subject. All doubts of this kind will be very soon set at rest; but they are interesting as showing that the great mystery of the campaign of 1876, as to the exact nature of Mr. Hayes's real convictions and beliefs on political subjects, is still unsolved. One thing, however, the silver debate has made very clear, and that is that the general policy of the Administration during the past year has reduced it almost to a position of isolation. It has not pleased the civil-service reformers, it has disgusted the Radical Republicans, and it has not detached a single Democrat from his party allegiance.

Indeed, the present condition of the political atmosphere at Washington is more remarkable, to any one who takes a philosophical interest in government, than at any time since the close of the war. Every negative sign points in one direction—to the disruption of the old parties and the creation of new ones. There is nothing on which either organization is united or has the slightest conviction. Democrats will tell you this as well as Republicans. The vote on the Silver Bill shows a very even division of parties on the currency question; there are no party lines any longer on the tariff. Mr. Wood's bill was concocted precisely as General Schenck would have concocted one ten years ago—not as a measure of civilized and enlightened taxation, but as a compromise of interests, combined with what you have recently called the "happy-thought" system. For instance: "Free-traders want Free-trade; Protectionists want protection; happy thought—have both. Increase free list, tax raw materials, please everybody." But nobody is pleased. So with regard to internal taxation: there are no party lines, and a Democratic House proposes to re-enact the income tax, which was the subject of the universal execration of the Democratic party through the war. As to civil-service reform, neither party can be said to be in favor of it, and, what is more, neither party believes that the other has any real intention of carrying into effect its professed intentions with regard to it. As to the South, the total impossibility of doing anything to reverse the action of the Executive prevents it from being really a question of moment. All these negative indications point to a disintegration of parties; are there no signs pointing to the appearance of a new one? Everybody disagrees with everybody else about the old questions; are there no new subjects upon which there is an agreement? If there were any body of men, however small, in either house of Congress who acted readily together in opposition to both parties, in favor of some distinct policy, there would be reason to look for the rise of a new organization. So far as measures of reform are concerned, there is certainly no sign of anything of the kind. Such members of the House as Messrs. Hewitt, J. D. Cox, and Randall Gibson, to mention three of the best representatives of that body, who probably think alike at bottom on most political questions, have no positive platform to stand upon. Messrs. Lamar, Hill, Randolph, and Bayard in the Senate are in the same plight. What sort of a position have these gentlemen been put in during the past four months? Simply that of opposing an iniquitous scheme of spoliation supported by two-thirds of their colleagues. There are no men in Washington who are better qualified by training and experience than those I have mentioned to be foremost in a new party movement—in favor of some rational policy in the interest of the whole country; but instead of that, they are reduced to wage a losing fight against Communists and Repudiators.

But while there are no indications at Washington of a formation of a new party such as reformers have been dreaming of, there are certainly signs enough of a movement such as reformers never contemplated. During the past five years we know very well that in the South large bodies of men have become accustomed to act together in the interest of a "reduction of the burdens of taxation," by means variously known as "readjustment," "scaling," and repudiation. In almost all the leading Southern States long-continued commercial and industrial depression has resulted in the formation of a party pledged openly and firmly to cut down State debts. A national party of the same sort has undoubtedly shown its head at Washington, and unless it is killed now will gather force. The sort of talk lately indulged in by Senator Voorhees and Mr. Bland, and their followers, is precisely like that of the Southern repudiators; and, I may add, closely resembles the harangues sometimes heard in that metropolitan cradle of liberty—Tompkins Square—from Mr. Justus Schwab and Citizen Maddox. This party has an organization, a treasury, energetic leaders; it knows what it wants. In short, we cannot any longer say that we are without a new party, and an active and powerful party; one made up of defections from the old parties; but it is not a party of reform, but of national dishonor and humiliation.

Meanwhile, what is Congress doing in its numerous other fields of activity? It is, of course, busily engaged in preparing the appropriation bills in committee; but beyond this there does not seem much probability of any general legislation at this session. Subsidies have been killed, or at any rate scotched, by a resolution of the House; and on no other subject is there any agreement. With regard to the appropriations, the Democrats in the House deserve great credit for their honest efforts at reduction of expenses in every direction. But it is evident that their efforts are also frequently misguided. They have an ideal in mind which is not an ideal fit for the adoption of a government of the size and complexity of ours. The majority in the House is, it should be remembered, a rural majority; it comes from parts of the country in which the "simplicity and economy of our forefathers" are kept in view as the best attainable standard in the conduct of life. In the zeal with which these members endeavor to restore a state of things which never

existed, there is something even more touching than in the attempts of certain municipal reformers to purify and reorganize the primaries in cities. Grave doubts exist in their minds as to whether anybody, under any circumstances, ought to spend more than $2,000 a year; and whether Government expenditures on anything above the grade of absolute necessities is not immoral. Every legislator brings to Washington with him a certain standard of living, a scale of expense, which he involuntarily applies to the Government; it is obvious that the scale brought up from the impoverished South must be a very different standard from that which used to be applied in the palmy days of the Republican régime, when legislation was in the hands of a part of the country where luxury and wealth were common, and where money was easily made and lightly spent. The new spirit of economy has come just in time, and if we are to have no choice between corruption and waste on the one hand, and misguided economy on the other, the latter is unquestionably the least of the two evils. The worst effect of the new spirit is shown in connection with appropriations for national objects of an important character, which have no active lobby in their favor, and which may therefore be attacked with impunity. Government surveys, Government expenditures for professional or technical objects, are scrutinized with a more jealous but less instructed eye than in the old days before the panic and the Democratic "tidal wave." Persons connected with branches of the public service in which expenditures of this sort are needed complain bitterly of the restrictions under which they are placed, and sigh for the good old times when money could be got for the asking, and deficiency bills were looked upon as a matter of course.

Possession of one branch of Congress, however, combined with the prospect of the speedy possession of the other, has already begun to sap the reforming zeal of the Democrats to a great extent, and the passion for investigation which, on the eve of an important Presidential campaign, possessed the party, shows signs of waning. The general investigation of all the departments set on foot a month or so since has thus far resulted in nothing, and it is not supposed that much will come of it.

A very important measure has been introduced in the House, which seems to have a good deal of support from the Southern members—to refer all claims against the Government for settlement to the courts. The history of the Court of Claims shows, as might be expected, that the Government interests are far better protected by judges than by irresponsible committees of Congress, and that Court has exhibited no dangerous inclination to extend its jurisdiction unduly. Claimants, of course, fare better in any court than before Congress, because their rights are defined by decisions and statutes, and there is some possibility of ascertaining beforehand what claims should be pressed and what stand no chance. On these and a great many other accounts there is every reason to hope that sooner or later the whole jurisdiction of Congress over claims, the history of which contains so long a record of injustice and spoliation, will be abandoned to the courts. With an inferior court, such as the Court of Claims, and an appeal to the Supreme Court, the Government being represented by counsel in both, there would be a speedy end to the greater part of the scandals which now grow out of the prosecution of claims.

Before this is done there will have to be some reorganization of the Supreme Court, which is now three years in arrears with its business, and is entirely unable to cope with the constantly-increasing volume of it. This matter has been taken up, I believe, by the Bar Association of this city. Some legislation on the subject will no doubt be attempted. It is much to be hoped that the crude method of keeping the amount of business down by a pecuniary limit will not be pushed any further than it has been already. It is safe to say that no more undemocratic or unjust feature can possibly exist in a judicial system. There is no connection whatever between the amount of money involved in a suit and the right of appeal. The right to obtain the opinion of the Supreme Court on a question of law ought to depend solely upon the importance or the federal character of the matter in issue. The idea that a suitor should be enabled to appeal to the Supreme Court because his case involves a large amount of money, when another whose pecuniary interests at stake are small cannot, is an idea which would seem, were we not familiar with it, essentially the product of a government of caste and privileges, and not of equal rights.

Of the claims now before Congress, the most interesting, from a public point of view, are still those growing out of the Geneva Award. To the old dispute between the insurance companies, the war-premium and the "exculpated"-cruiser claimants, there is now likely to be added a new one growing out of the Canadian Fishery Award. In accordance with the Treaty of Washington and this award under it, we are called upon to pay $5,000,000 to England for the right of fishing granted to American fishermen in Canadian waters. The recent visit of Lord Dufferin to this city was supposed to be connected with this matter. He was anxious, it was understood, to find out whether we proposed to pay or not. If he got any definite assurances on the subject he was very lucky, and those who made them were very rash. There will, without question, be a good deal of opposition to the payment of the award in Congress. General Butler has stated that he is opposed to the whole thing—not on account of the money, but as a matter of principle. It is said that Mr. Ensign H. Kellogg, the American Commissioner, had an opportunity to reduce the amount of the award, as it was intimated to him by his colleagues that if he would sign it they would take off a million or so. But he, too, refused—perhaps also on principle.

What is to be the fate of the Geneva Award will probably be settled at this session of Congress. The fund still undistributed is a large one—not far from $10,000,000. A number of hearings have been had before the House Judiciary Committee, and still others before a sub-committee of that body which has been appointed to draft a bill. So far as can be inferred from the indications at the hearings, the Committee is in favor of some sort of distribution, and several of the members are known to be disposed to recognize the insurance claims. The great promoter of the war-premium and "exculpated"-cruiser claims, General Butler, is very active in behalf of that interest, and it is difficult to say what the result will be. There is no doubt that the insurance companies have a better chance than they had last year, though that is not saying a great deal, and there is equally little doubt that, if the present session goes by without any distribution of the fund, the money will remain for ever in the Treasury.

FOOD-ADULTERATIONS IN GERMANY.

GERMANY, January 15, 1878.

AT a meeting of apothecaries some weeks ago one of the learned gentlemen stated that Schiller's study had been recently discovered to have been formerly papered with a green paper-hanging. Upon examination this had been found to contain a quantity of arsenic great enough to explain the sufferings and the early death of the poet. I cannot vouch for the correctness of these assertions; but if they be true, our literature, for aught we know, might have had half a dozen other tragedies like "Wallenstein" to boast of, if Schiller's landlord had chanced to select a blue instead of a green paper for this particular room. Perhaps the poet was inhaling the deadly poison when, in his 'Geschichte des Abfalls der vereinigten Niederlande,' he penned the following lines: "The whole earthly happiness, even the life, of the honest man was now given into the hands of every rascal. . . . The truth of social intercourse was gone. . . . Social life was poisoned by a contagious distrust. . . . No honest man was trusted by the people, and nobody was believed to be honest." He, however, assuredly would not have deemed it possible that another age should be in store for mankind of which some misanthrope might be tempted to say the very same things, and that the secret causes by which he himself was hurried to his premature grave were the forerunners of this age. The Spanish Inquisition certainly, and grand but dark political plots and schemes like those of Philip II., have nothing to do with the fact that "the whole earthly happiness, even the life, of the honest man is *now* given into the hands of every rascal." Not the Dominicans, but a great number of manufacturers and trades-people, are after us, and these are not seeking souls *ad majorem Dei gloriam*, but merely pennies. Some of these gentry are satisfied with betraying thousands of the hope of regaining their health; they only substitute some worthless stuff for the valuable and costly things they pretend to sell; others gradually, but directly, systematically, and surely ruin the health of thousands by adultering their wares with some more or less strong poison, or using poisonous ingredients to make them "show off" better; and still others suffer themselves to be betrayed by their lust of gain into a wholesale slaughter. One need not be a sentimentalist to be, in all soberness, deeply convinced that here too is a "social question" of really awful import.

Allow me to make good this assertion by mentioning a few of the numberless cases which, in the last nine or ten months, have come to my knowledge just in reading my daily paper. I shall take care not to give the whole list, in order not to tempt any Pharisee to construct the whole bird out of one feather and to ask whether the proverbial virtue of the Germans, sterling honesty, is to be found anywhere except in the readers of our school-boys. Not very long ago the Society of Housewives in one of the larger cities—if I remember right it was Leipzig—got a lot of sau-

sages from some other place renowned for its fabrication of this favorite dish of all Germans. The law forbids any pork to be sold without having been examined under the microscope. In spite of that these sausages were so filled with trichina that about a hundred persons are said to have become, in a greater or less degree, the victims of this dreadful disease. In the summer two butchers of a smaller town in Saxony bought a cow so sick that they had to transport her on a wagon, and barely got her alive into the slaughter-house. Over a hundred persons who ate of the meat fell dangerously sick, and nearly a dozen died.

These are the worst cases as to the immediate results, but the guilty parties can, perhaps, only be accused of criminal negligence and dereliction of duty. From a certain point of view, therefore, the following examples represent a higher grade of the evil. A gentleman on whom the physicians had for many years tried in vain their skill and their wit, was at last found to be poisoned by lead; every time he opened his snuff-box he took some particles of lead with the weed. It would be interesting to know how many persons, in the course of years, the manufacturer had subjected to the same process of slow poisoning by using, against the law, lead-paper wrappings in order to save as much as, perhaps, this one man had spent on his physicians and in watering-places. Last summer the public were officially warned to beware of baby-carriages with a roofing of a certain white oil-cloth containing a great amount of lead; in some places all these carriages were confiscated. Quite recently the wall-paper manufacturers have been reminded of the law forbidding them to use the poisonous aniline colors. These same aniline colors are used to a great extent for "freshing up" old sausages and poor meat, and for "making" wine. I remember to have read last year three times of enormous amounts of "wine" having been emptied into the gutters by the authorities because they contained *Fuchsin*. A large wine business of good repute in Berlin, whose specialty was the purest and dearest wines for sick people, has been closed because, as the papers report, there was not a single drop of real wine in the bottles. One-half of the twenty different kinds of beer brewed or sold in Berlin are officially declared not to consist of malt and hops. It is the more satisfactory to know this, inasmuch as the authorities have had the kind consideration for the poor adulterators not to tell which beers *are* beers. The honest brewers are likely to have the same experience as the German chocolate manufacturers. During the last four or five years a Dutch firm, Van Houten, sold enormous quantities of its cacao in Germany, although it was considerably dearer than the best offered by the German manufacturers. The physicians recommended it very highly because it was warranted to be absolutely pure. Now, upon examination, it is found to be, if not directly adulterated, yet prepared in such a way with different chemicals as to have the effect of a bad adulteration. The thousands who have indulged in this luxury in order to improve their digestive organs have now the satisfaction of knowing that these were not weakened to such a degree as to be unable to stand even this "baby's delight," but that it requires a very strong stomach to partake of it for any length of time without harm. Van Houten's proceedings, however, compare very favorably with those of a number of his German competitors. Stollwerck Brothers, in Cologne, have had seventeen kinds of German chocolate analyzed. "The results were incredible: nine of them contained no cacao at all; only ground cacao-pulps, common browned flour, and bad sugar were the ingredients. In two cases there were, besides, found—not to speak of the addition of vegetable dyes—5 and 10 per cent. respectively of cauk. Of this the manufacturers themselves had no knowledge; upon further examination, it was traced to the adulterated flour from Bucholz, in Hanover, which they had used."

The last sentence points to the worst feature of the evil. It seems almost impossible to protect the public effectually against these modern harpies, as they themselves are often the victims of their own kith and kin. It is already almost difficult to name half a dozen kinds of food which are never adulterated. If one wants to be absolutely sure that it is food he has on the table, and not a wonderful mixture of minerals, dyes, and nameless liquids, he has to send everything to be examined beforehand. Perhaps it would come to that if the analyzing did not take so much time and if the pleasure were not so very costly. Some people, however, can hardly afford to avoid the trouble and the expense. Our farmers have been repeatedly warned not to buy clover-seeds or artificial manure without having it examined at a "landwirthschaftliche Versuchsstation" (agricultural experiment station). It is bad enough to cheat people into sowing pebbles instead of seeds, or into ploughing poison instead of manure into the ground; but it is much worse to make them eat chaff, pebbles, and poison, and to make them give poisonous playthings to their children. Our lawgivers do not overlook this. Bismarck personally takes a lively interest in these questions, and the *Reichs-Gesundheitsamt* has commenced a most determined crusade against these *hostes generis humani*. A commission, presided over by the President of the *Reichs-justizamt*, Dr. Friedberg, is now in Berlin at work draughting a bill to prevent the adulteration of eatables and drinkables and the use of materials detrimental to health in the manufacture of wall-papers, wearing apparel, toys, etc. As the basis for their deliberations the commission have adopted the proposals of a committee of experts which, under the auspices of the *Reichs-Gesundheitsamt*, has had the subject in consideration from the technical point of view. The Reichstag is expected to meet in February, and this bill will probably be introduced in the course of the session. The statesmen of other countries may find it worth while to bestow some attention on the debates that are likely to arise over it. With us nobody expects to see the great problem at once successfully solved, and nobody thinks that the law alone can bring about a satisfactory solution. Public opinion, which hitherto has been criminally lenient towards this worst class of thieves, must fix an ineffaceable brand on their foreheads, and the honest manufacturers must firmly stand together against these birds of prey, who, indirectly but often none the less effectually, deprive them not only of the fruits of their industry but also of their good name. In both respects a promising beginning has been made. In the former the press is doing good service; and in the latter, interest proves to be a still better teacher. An association of wine-growers and merchants has been formed, which, supported by the good crops of the last years, has already done considerable damage to the wine-manufacturers. The brewers are also stirring; they demand penal laws to stop the competition of beers made of dye-woods, molasses, quassia, etc.; and the public are already discussing the question whether they could not imitate the example of the Bavarians—*i. e.*, get their beer only where they have reason to believe that they really do get beer. In January, 1877, a great number of the principal chocolate manufacturers entered into a formal and binding agreement not to use substitutions of any kind whatever. The members of the association have adopted a common trade-mark, and their business has not declined, though they have had to increase their prices, while some of the other manufacturers have even lowered theirs. This may, in the end, prove to be the only efficient method of driving the rascals out of the market.

Correspondence.

POLITICAL OFFENCES.

To the Editor of The Nation:

Sir: Will you, for the benefit of your readers, be so good as to define a "political offence," as you understand the term?

Do not the words "political offence," as commonly used, signify an offence committed for the purpose of affecting the distribution of political power, as distinguished from an offence committed for some other purpose, as that of pecuniary gain or of revenge?

I infer from remarks in your paper that the Democratic leaders in Louisiana agreed to condone political offences. If the offences which they thus agreed to condone were not those committed by the Returning Board, what were they?

Very respectfully, E. J. L.

Boston, February 16, 1878.

[We can recall no case in which the term "political offence" has been made to cover anything but armed resistance, or combinations with a view to armed resistance, to a government on the part of persons owing it allegiance, or riotous or disorderly conduct arising out of hostility to the government or its legislation. We believe the present effort to make it cover the forgery and falsification of legal records by government officers is absolutely novel. This use of it would indeed make Tweed simply a political offender, and put him in the same category with the Carbonari, the Hungarian rebels, the Fenians, and the Cubans, for he stole and forged partly no doubt for purposes of pecuniary gain, but mainly "for the purpose of affecting the distribution of political power." As we point out elsewhere, the Louisiana Legislature said nothing about "political offences." If any one will furnish us with a precedent for the use of the term to cover the offence described in the Louisiana statute, or anything similar, we shall be much obliged to him.—Ed. Nation.]

THE WOODRUFF EXPEDITION.

To the Editor of The Nation:

Sir: I see by the *Nation* of February 14 that my reference to officers of naval practice-ships as the best authorities for the dangers to which youth would be exposed on the Woodruff Expedition has been slightly misconstrued. I did not mean to intimate that a school or training-ship was an exceptionally bad place for young men, but only that naval officers best understood the dangers which might arise from suddenly setting several hundred young men free in a foreign port after months of the *ennui* of ship life, and the difficulty of keeping them under proper restraint when they went as passengers paying their own way.

Navy.

REPUDIATION AND THE SPOILS SYSTEM.

To the Editor of The Nation:

Sir: Two diseases of singular virulence and persistency afflict our body politic—one, the craving to evade the payment of public and private debts; the other, the passion for obtaining a living at the public expense by the work of controlling votes at popular elections. The long co-existence of the two maladies, for they began their ravages at about the same time, suggests an enquiry into their connection with each other. The struggle for office through politics, which was the first to show itself, broke out immediately upon the inauguration of President Jackson. His policy of removing his opponents and rewarding his friends, continued by his successor, was confirmed as the leading rule of practical politics upon its adoption by the Whig party in 1841. The practice, as yet unshaken, increased in extent and influence with the vast increase of offices which followed the breaking out of the civil war.

The date at which repudiation began is less definitely fixed, and the disease itself is of a varying and intermittent nature. In our business affairs, prosperity, speculative mania, prostration, and slow recovery follow each other with periodic regularity. During the hot fits of speculative activity, when borrowing is easy, repudiation is never heard of. It makes its appearance only with the chill of depression, when payment is hard. The greater part of President Jackson's Administration was a time of apparent prosperity; but when the crash of 1837 burst the bubble, open repudiation of debts by State governments and the suspension of specie payments made it clear that the disease had taken hold. The shorter and less important crisis of 1857 was followed by some similar but less serious symptoms; while the great break-down of 1873 has given rise to the widest and deepest manifestation of financial immorality which the country has yet seen, culminating in the scheme of a general reduction of debts by substituting a coin worth ninety cents for a coin worth a hundred.

If the experience of one country for half a century in showing the growth (in the main co-extensive) of these two evils is not enough to prove their necessary connection, let us bring into view the experience of Europe during the same period. In England, in France, in Germany, in all those free countries where no form of repudiation has within fifty years even received the countenance of any political party, the tenure of the great body of civil officers has been independent of changes of government. But when we turn to countries where faith with creditors has not been kept there we inevitably find a partisan civil service. In Spain, for instance, where partial and progressive repudiation is a national policy, we need only read the trustworthy pages of Mr. Wallis's work to learn how dependent all public offices are upon the favor of the supporters of the ministry in the Cortes. And in Greece, where there is no pretence of paying the national debt and public credit is a byword, it is notorious that subordinates in the departments are changed with every change of administration, and that local officials hold their places only on condition that they shall control elections. I do not care to dwell on the fact that the dark lines in our recent history are paralleled only under the worst of the Christian governments of Europe, and it would obviously be unfair to draw Turkey into the comparison, because in Turkey finance and administration have the same object—namely, the plunder of Christians—and the problem is complicated by religious motives, fortunately lacking elsewhere.

A thorough analysis of the two evils would require more space than you could give, but no long process of reasoning is needed to trace both to a common source. What is the spoils system? It is the system which treats politics as a great national game of mingled skill and chance, in which votes are the pawns to be moved, and popular impulses and public needs the accidents to be taken advantage of; in which place and power, honors and profits, are the prizes of the successful players, to be distributed according to the importance of each player's service. The monopoly of executive government is their reward. But alongside the game of politics runs the game of speculation, and here the players know too well how the legislative powers of the government can be used to load the dice. When times are prosperous grants and subsidies are their aim. And when the game is up it is again to the legislature that the losers turn for a diminution of the forfeit. Whatever the cause of the pressure, whether it be the wasteful use of public or of private credit; whatever the relief sought for, whether it be debasement of the currency, easy bankrupt laws, or open repudiation, it is always legislation which is expected to furnish the remedy.

The two-fold affliction is in truth one and the same disease, manifesting itself in different organs; it is the deep-seated idea that government exists only for the acquirement of power or money by those who know how to grasp and use one of its active powers, the executive or the legislative, as the case may require.

How then shall we treat it? Has it come to this that we are reduced to consider how far this idea may be put in practice and still allow us to retain under its gradual advance, made slower by resistance, some measure of public credit, some endurable administration of laws? Or may we look higher, may we reasonably strive for a restoration of government to its legitimate purposes; for the use of its legislative power to maintain individual rights and to protect public interests; for the administration of its executive duty by officers selected and promoted solely for fidelity and capacity? The example of other nations teaches us to what level we may fall if we yield to this great moral disease. The history of our own country shows what singular recuperative power we have. Clear brains, skilful hands, patient resolution are needed to lay the knife at the root of the evil; but, above all, a true and wide-spread understanding of its nature and its danger before it has done its fatal work. B.

Boston, February 16, 1878.

HOW TO MAKE STATES PAY THEIR DEBTS.

To the Editor of The Nation:

Sir: In your issue of the 31st ult. you ask, "Can States be Made to Pay their Debts?" to which the answer given is, Not as matters stand; but this ought to be changed by the repeal of the Eleventh Amendment, and the consequent restoration of the suability of the States.

I undertake to point out an easier mode: Citizens of New York own millions of dollars of bonds of the State of Tennessee, which are being repudiated. If New York and Tennessee were distinct nations, this injury by the latter to citizens of the former would be a just cause of war. Then New York would owe it to her aggrieved citizens to give them redress by flogging Tennessee into payment of what was due, *plus* the expenses of the war for its collection. Being, however, fellow-members of the United States, New York cannot make war on Tennessee. But none the less does she owe it to her aggrieved citizens to wield her Statehood in their behalf if this can be done. Now it *can* be done, and that effectually.

New York can sue Tennessee in the Supreme Court of the United States. Let her take the Tennessee bonds of her citizens, giving her own in exchange for them, having a longer time to run, the transaction being upon such terms that she cannot in any event lose thereby. Perhaps it would answer for her merely to undertake to collect the Tennessee bonds for a commission. An agent to whom commercial paper is transferred for purposes of collection may sue thereon in his own name. But some arrangement by which New York should sue on the bonds in her own name could easily be made. There would then be no difficulty in New York's obtaining a judgment in the Supreme Court of the United States against Tennessee.

The question remains, How could this judgment be collected? A judgment against a county or a municipality is collectible by a *mandamus* commanding the corporate authorities to assess and collect a tax to pay off the judgment. In some States—Iowa, for instance—if they neglect to do so the court may compel them by proceedings for contempt, or may constitute the sheriff a special commissioner to assess and collect the tax. By analogy, it is held that, in this state of the law, the Federal courts may, under similar circumstances, constitute the marshal a special commissioner to assess and collect the tax. Now, this mode of proceeding may be made applicable in the case of a judgment against a State.

As the law now stands, the Supreme Court, having rendered the judgment, may compel its payment by a *mandamus* commanding the

Legislature of the State to assess and collect the necessary tax. The States, as to each other and with reference to the jurisdiction over them of the Supreme Court in favor of each other, are simply municipal corporations. Had it not been understood that the jurisdiction of the court involved compulsion to enforce the judgment it was empowered to render against a State in favor of an individual, the resistance thereto which produced the Eleventh Amendment would not have been made. There would have been little objection to a judgment against the State which should stand merely on the footing of a judgment of the Court of Claims, requiring a voluntary appropriation for its payment.

The Legislature of the debtor State could be compelled by *mandamus* to pay off the judgment against it as the law now stands. But Congress might provide that if they did not then the Supreme Court might appoint as many special commissioners as might be needed, not exceeding a given number, to assess and collect a tax throughout the State to pay off the judgment. The law might empower the commissioners to resort to the books of the revenue officers of the State for the basis of the assessment, which would make easy the task of preparing their own books. The tax being assessed, each individual's part of it would be a debt due from him to the creditor State, payment of which might be made enforceable by the process of the court or by suit in the local Federal Court. The details could be easily arranged.

That such legislation would be constitutional there can be no serious doubt. The Constitution vests in the Supreme Court jurisdiction of causes of States against States, and Section 8 of Article I. confers power "To make all laws which shall be necessary and proper for carrying into execution the foregoing powers and all other powers vested by this Constitution in the Government of the United States or in any department or officer thereof." A law providing for carrying into execution the judgment which the Supreme Court is empowered to render would, of course, be clearly within the residuary power conferred by the clause just quoted.

If New York would but do her duty to her aggrieved citizens, creditors of Tennessee, the latter State might, without any change in, or addition to, the law as it now stands, be compelled to pay her indebtedness now due these citizens. But with the aid of such a law of Congress as has been suggested the process of collection might be made very plain and effectual.

R. McP. Smith.

Nashville, Tenn.

HOW THE PRESENT DUTIES ON WOOL WERE FIXED.

To the Editor of The Nation:

Sir: In an article in your last issue entitled "Some Observations on the Proposed New Tariff" you—unintentionally, I have no doubt—do great injustice to the memory of an eminent merchant and manufacturer.

Under the head "Schedule L—Wool and Woollens," you state that

"The classifications of the present tariff are nominally retained, but the existing distinction between clothing and long combing wool is effectually abolished, and both classes, when unwashed, are made subject to a simple duty of 8 cents per pound on wool costing 32 cents and under, and of 10 cents on wool costing over 32 cents per pound. Why this useless distinction should be maintained and allowed to mar the undoubted improvement here proposed it is difficult to explain. The bill also maintains the existing discrimination in favor of English long wools (Class II.), which are allowed to come in *washed* at the single rate of duty, while washed clothing wool has to pay double the rate of unwashed. This discrimination, it is well understood among the trade, was introduced into the tariff of 1867 at the instigation of a prominent New England manufacturer, to whose special benefit it has inured, and who will rub his hands in the grave that now covers him if he learns that his heirs are to continue enjoying the benefit under a reformed tariff."

I was personally conversant with all the circumstances incident to the inception, construction, and enactment of the present wool and woollen tariff, and can assure you that the "New England manufacturer" whose memory you so ruthlessly desecrate had no part in establishing the "discrimination in favor of English long wools" of which you complain. The duties on wools of all classes were determined by the wool-growers, and not by the wool-manufacturers.

You say that it is difficult to explain why a distinction is maintained between clothing wools and long combing wools. It is justified by several practical reasons. I will state one of them: In applying duties to these classes of wools, reference must necessarily be had to the condition in which the wools are usually imported. Wools of the first class are usually imported *unwashed*, and wools of the second class *washed*. In regard to the first class of wools, therefore, it was necessary to make a provision against an evasion of the duty by washing the wools abroad. The "discrimination" of which you speak is more nominal than real, and was introduced to prevent frauds on the revenue, and not, as you suppose, to favor any class of manufacturers.

Respectfully yours, E. B. Bigelow.

Boston, February 9, 1878.

[To make the merits of the above-quoted stricture apparent to those of our readers who are not conversant with the origin and operation of our present wool duties, we must enlarge further upon this complicated subject than we were able to do in our late observations on the proposed new tariff.

The Act of March 2, 1867, which remains in force as far as wool is concerned, subjects fine clothing and fine combing wool nominally to the same duties; in reality, however, it establishes a wide distinction between these two classes, by a provision which allows washed combing wool to come in at the simple rate of duty imposed on unwashed wool, while washed clothing wool is made to pay double that rate, and is thereby effectually excluded from our markets. In order to estimate the actual duty on any kind of wool we have to find out what one pound of wool, when cleaned of all impurities, is made to pay. Reduced to this standard the two classes of wool in question now pay the following rates, viz.:

Clothing, from 27 to 46 cts. per lb., equal to about 52 to 100 per cent. ad val.
Combing, from 16 to 17 cts. " " " 43 to 45 " "

To say that such a discrimination is more nominal than real appears to us simply absurd. When Mr. Bigelow says that clothing wools are usually imported unwashed, and combing wools washed, he states a well-known fact; but he mistakes as the cause of the above distinction in our tariff what is in reality its effect. He is not ignorant of the fact that Europe imports a very large proportion of its supply of clothing wool washed and even scoured, while we are prohibited from doing so by the provisions of our tariff; and he will not deny that some of the most useful classes of clothing wool are effectually excluded from our markets, even in the unwashed condition, by those provisions and by those only. What the distinction between clothing and combing wool has to do with the prevention of frauds on the revenue, we are unable to comprehend. Instead of defending it on such untenable grounds Mr. Bigelow might indeed have stated one reason, and the only valid one we can find, for levying a lower *specific* duty on combing than on clothing wool, namely, the lower value of the clean pound of combing when compared with most kinds of clothing wool. Such moderate distinction would result from a uniform ad-valorem duty on all wool, and so far would be just and equitable.

Mr. Bigelow's assertion that the present duties on wool were determined by the wool-growers and not by the manufacturers will find few believers outside of the small circle of specially-favored establishments and among the heavily handicapped consumers of clothing wool. Such may have been the impression when the Act of 1867 was passed, but since then it has long become generally understood that in getting the tariff of 1867 fixed the manufacturers had the lead, and the wool-growers were in tow. What inducement, we ask, could the wool-growers have for asking less protection on combing than on clothing wool, when it is a well-known fact that on this side of the Rocky Mountains long-wool sheep pay the farmer a better interest on his investment than merino sheep? Says an experienced farmer in our State, when reporting to a Boston paper (see *American Cultivator*, January 19, 1878) the discussions of a delegation from the National Association of Wool Manufacturers and of Wool-Growers:

"I do not think it is just and right to give the grower of merino wool an average protection duty of 31½ cents on every pound of scoured wool that he raises, while the growers of Cotswold, Leicester, and other long wools have a protection duty of only 16½ cents on scoured wool."

And further on:

"Our duties discriminate against the very class of sheep and wool which improved agriculture, the demands of trade, and the

wants of meat-eaters alike demand that we should raise and increase as rapidly as possible."

When we are charged with "desecrating the memory" of a deceased manufacturer who undoubtedly profited largely by this unjust discrimination, we admit that it might have been more useful to accuse the living rather than the dead instigators of that transaction; but knowing what we do of his share in it we must decline to acknowledge the injustice of our charge, though the person referred to may not have taken as active a part in the framing of the tariff of 1867 as some others. Here is, in conclusion, what an experienced Massachusetts manufacturer (Mr. Slater) said touching this matter before a meeting of woollen-manufacturers recently held in Boston, as reported in the Boston *Journal of Commerce* of January 12:

"When I hear those who represent second and third-class wool (laughter) I hardly dare trust my lips to reply to them. I do not regard them as honest. They are selfish; they ought to be ashamed to advocate the duty on the raw material which they do. It gives them a protection which is exorbitant, which makes them bloated, and they are completely crushed under its weight."—Ed. Nation.]

HARVARD EXAMINATIONS FOR WOMEN.

To the Editor of The Nation:

Sir: At the request of the Philadelphia local committee on Harvard examinations for women, I published a short article on that subject in the *Penn Monthly Magazine* for December, 1877. It has called forth replies from Col. T. W. Higginson in the *Woman's Journal* of January 12, and from Charles J. Stillé, Esq., in the *Press* of January 30, to which it seems well to say a few words in return. It is the position of these gentlemen rather than their arguments which call for an answer; Col. Higginson, besides his general reputation, enjoying great credit in certain female circles, and Mr. Stillé being provost of the University of Pennsylvania. Much of what they say I must pass over in silence, as it deals with matters of opinion, not of fact. But as they have questioned some of my statements I am bound for the sake of the subject of discussion, and for those for whom I undertook it, to make good what I have asserted.

Most of Col. Higginson's objections arise from careless misinterpretation of what I said. Being limited for space I may have written in too general a manner, and trusted too much to the understanding of all my readers; but it seems to me that the "encouraging response" of which I spoke in the beginning evidently referred to the particular point of university examinations for women, in which it cannot be denied that England set the example. Probably few people in America knew so well as I—even before "the visit of the Amberleys"—how much we were in advance of Englishwomen in our eagerness for education, the degree and variety of our information, the keenness and range of our intellectual interests. I say *were*, for a dozen years have made a great change—for the better with them, for the worse with us. In this direction, as in some others in which we had the start of them, they have gone much further than we. For instance, in the "woman's rights" movement (to use a term which avoids details) the concessions and privileges which have been obtained by our sex in England are at once broader and more solid than those which have been gained in this country. The more rational and enlightened mode of setting to work of the English could not be better exemplified, to my mind, than by the one fact that, while we have covered the face of the country with rival institutions for female education which the whole civilized world could hardly supply with first-rate instruction, they have placed their experiment of Girton under the wing of their great foster-mother of learning, where the daughters really share the advantages of the sons.

Neither was I ignorant that the absence in England of our public-school system, whatever may be thought of its results, and of institutions similar to Vassar, Cornell, etc., was one reason why their female candidates for university certificates so greatly outnumber ours; there are other reasons which I might have given if I had been writing on both sides of the question, but they do not alter my opinion that our paucity is discreditable. Granting that Harvard is surpassed by Vassar in mathematics, Cornell in Greek, Michigan in chemistry, are women to go to Vassar, Cornell, Michigan, all three, to get an education? At Vassar, according to my latest advices, a year ago they could get no Greek at all, and very little geometry. But I supposed that the superiority of Harvard to all other schools in the country, even upon the whole to Yale, was admitted. In speaking of its long record I naturally meant the record of its fame, not of its age. If this superiority be not admitted, I refer those who dispute it to the sources whence I drew my own information, which are open to everybody, viz.—the circulars of the different universities and colleges, with the courses of study and lists of professors, and the catalogues of their graduates (to prevent further mistake, let me say that I allude not merely to their numbers but their standing), and to the papers of the Harvard female preliminary examinations for 1877. There is not room in ordinary magazine and newspaper articles for these tabular and statistical comparisons.

Mr. Stillé begins his "careful and candid examination of the scheme" of Harvard female examinations by saying: "The preliminary course need not detain us. At the advanced examination the candidate is permitted to choose subjects from one of five great divisions, viz.: First, languages; second, physical science; third, mathematics; fourth, history; fifth, philosophy; and, if she satisfies the examiners by her answers on *any one of these subjects*, she is entitled to a certificate." Now, it will be shown that the preliminary examination, which is dismissed as of no moment, is but little below the standard of a complete education at the University of Pennsylvania, carrying the candidate in some directions as far as the Junior class, in others as far as the Senior. It is not possible to give parallel tables of the courses, because, for instance, English at our University covers history and literature, while in the Harvard examinations for women they are separate studies—the latter necessitating a thorough and philosophical knowledge of history, ancient and modern, European and American, religious and secular, while the English required of the Junior class is only Green's 'History of the English People.' International law and social science do not form part of the female course, as they do in the Senior class of the University of Pennsylvania; but Shakspere does not appear in the curriculum of the latter, and Taine's 'English Literature,' which is the manual of the Seniors, does not enable a student to answer the questions of the Harvard examinations. To take another branch, physic, the Senior course requires no more acquaintance with the subject than the Harvard female examination papers, except where it enters the region of astronomy, which is fully compensated by the severe course of physical geography in the Harvard preliminary examinations—a study not belonging to the college course of the University of Pennsylvania. Latin, German, and French were included in the Harvard preliminary work last year. In 1878 Greek is added, and is elective with Latin or German. The Greek course consists of four books of Xenophon's 'Anabasis' and the first book of the 'Iliad,' which is more advanced than the Greek required at the University of Pennsylvania, and about equal to what is taken as an elective study in the Senior year. Latin becomes elective with French in the Junior year. Their highest course of French is far behind that of the Harvard preliminary examinations. The German of the Junior class (also elective) is on a par with it. Let us see what Latin is actually required by our University: of the Freshmen, "Selections from Livy and Horace's Satires, with Professor's Syllabus"; of the Sophomores, one of Tacitus's histories, one of Cicero's orations, a selection from Horace's odes, with syllabus of metres! After this it becomes elective. The female candidates for the Harvard preliminary examinations last June passed a thorough exercise in Latin grammar, translated from Latin into English and *vice versâ*, and were questioned on Virgil ('Æneid'), Phædrus, Justin, Cornelius Nepos, Roman history, and geography. The seven branches of the preliminary examination must be passed before the candidate can take any one of the five divisions of the advanced examinations; therefore everybody can perceive the want of candor in omitting it from a discussion of the subject. A young woman who has passed satisfactorily in history, English literature, physical geography, botany or physics (which are in future to be elective with each other), arithmetic, algebra through quadratic equations, plane geometry, and French, German, Greek, or Latin, is in all those branches, except the classics and mathematics, much beyond the point at which the student of the University of Pennsylvania begins his elective studies. The advanced examination in any of its divisions is above the level of the Senior course, required or elective.

To return to the standing of Harvard, to which Mr. Stillé frequently recurs; it certainly settles the question, at least between her claims and those of the University of Pennsylvania, that the Senior course of the latter, including the elective branches, with the sole exception of German, must be completed to take the student over the ground covered by the Freshman year of the former, which in addition includes chemistry, a study not forming part of the academic course of our University. Philosophy and English are Senior studies of the latter not taken by the Harvard Fresh-

man, as they belong to his later courses; but the inexorable fact remains that in the classics, modern languages, and mathematics the Harvard student enters the Sophomore class at the point the graduate of the University of Pennsylvania takes his diploma—"the test of culture" of this institution. Those who doubt can verify for themselves by consulting the catalogues of the two colleges. The reputation of Harvard, however undeserved or contested, is to be gauged by comparing the number of her undergraduates last year with those of some sister universities: Harvard, 813; Yale, 582; Princeton, 451; University of Pennsylvania, 131.

Just a year before the publication of my article in the *Penn Monthly* for December, an appeal was made to our University, through the provost, to confer certificates on women by the same plan as that of Harvard, which was refused. Those interested in promoting female education then applied to Harvard to extend her examinations to Philadelphia, which was granted. There are now classes in history, chemistry, and physics open to women at the University of Pennsylvania. This is a wise and generous step which we hope will meet with recognition on the part of our women. But it is absurd to claim that even all three branches constitute a course approaching that of the Harvard *preliminary* examinations, not to speak of the advanced ones. There are, moreover, serious obstacles to the usefulness of this measure; the distance of our University from the main city of Philadelphia and from its most important suburbs is a difficulty in the attendance even of male students; and many persons, especially the parents of girls, object to a system of co-education. Mr. Stillé's statement that chemistry, physics, and botany cannot be studied accurately and thoroughly at home will be denied by many men who have distinguished themselves in those sciences; his assertion, that only "the most elementary part" of a language can be acquired by private tuition, is absolutely contradicted by the experience of the most intelligent tutors and students of languages. He claims to have proved that preparation for the examinations by private instruction is impossible; this can neither be proved nor disproved with regard to the advanced examinations until next June, as hitherto nobody has taken that course, although a number of candidates are now preparing for it in that manner; at the preliminary examinations held in New York last year one of the three who passed in the entire course without conditions had been prepared exclusively at home and alone.

In conclusion, I wish to say that it would ill become me, as a woman, to discourage the experiment of female colleges or co-education, and as a Philadelphian to decry the University of Pennsylvania, and I have not meant to do either. But as my statements were attacked, it was incumbent upon me to confirm them; having done so, should my articles be honored with further notice, there will be no rejoinder.

SARAH B. WISTER.

PHILADELPHIA, February 4, 1878.

Notes.

THE war correspondent of the *Times* in Asia Minor, Mr. C. B. Norman, gives his observations of the obscure military events in that quarter in a volume, 'Armenia and the Campaign of 1877,' to be published next month by Cassell, Petter & Galpin.——G. P. Putnam's Sons will shortly begin a series of volumes called 'Current Discussions,' made up of "essays of special note and permanent importance upon the questions of the time that have been recently contributed to leading English periodicals." The essays will be grouped by subjects, each volume being devoted to a single one. Mr. Edward C. Burlingame will be the editor.——A new work on the successful American Communities, with all the information needed by those who wish to join them, is in preparation at the Oneida Community. The author is Mr. Wm. Alfred Hinds.——A. S. Barnes & Co. announce that the first volume of the *Magazine of American History* is very scarce, but that they will endeavor to procure it for subscribers to the succeeding issues.——The March number of the *Popular Science Monthly* will contain an article by Mr. E. R. Leland, on the "Debasement of Coinages," that promises to have a timely interest.——The Philadelphia *Ledger* calls attention to the pending offer by M. Rochambeau to sell our National Library, for a moderate price, the important collection of papers left by his ancestor, our Revolutionary ally, Count Rochambeau. Like other urgent subjects for legislation by the present Congress, its consideration has been postponed by the silver controversy. We hope its ultimate acceptance is not doubtful.——Porter & Coates, Philadelphia, will soon issue Macaulay's 'History of England,' in five volumes 12mo, from new electrotype plates from the last English edition.——Mr. Frederick Martin's 'Statesman's Year-book' for 1878 comes to us with its usual punctuality from Macmillan & Co. This unrivalled manual is designed to represent the normal constitution and condition of civilized countries, and hence does not generally take account of political complications or reflect passing events. In the case of Turkey, however, the section on the military forces has been entirely rewritten, and there are several allusions to the war now in progress, as, *e.g.*, p. 467: "It was reported at the commencement of the Russian war that 'the printing of "caimés" [paper money] is going on uninterruptedly, and new presses are put to work, to issue them in larger numbers than before.' According to reliable estimates, more than twenty millions sterling of paper money had been issued by the end of November, 1877." Considerable additions have been made also to the bibliography of Turkey, but here, as in the case of the United States and of other countries, the editor does not show either as much knowledge or discrimination as would be desirable.——Dr. Paul Topinard's excellent compendium of Anthropology, which first appeared in the Reinwald series called "Bibliothèque des Sciences Contemporaines," has been translated, like the other volumes in the same series, for the benefit of English readers, and is now published in this country by J. B. Lippincott & Co. It has a good index.——The new American Art Association will open an exhibition at the Kurtz Gallery on the 3d prox.; this society represents the younger artists who have been studying under European masters. At an inaugural dinner on the 16th inst., expressions of sympathy for the new movement were elicited from Judge Noah Davis, Mr. August Belmont, the Rev. Doctors Alger and Bellows, Mr. Clark Bell, and others.

—The *Galaxy's* legacy to the *Atlantic* for March is a (now posthumous) paper by ex-Secretary Welles on "The Opposition to Lincoln in 1864." It is but a disjointed production, which only half fulfils the promise of the title. Mr. Welles once more holds up to public scorn the Radicals who opposed Mr. Lincoln's initiation of reconstruction, on the basis of the proclamation of December 8, 1863, and once more fails to perceive the logical outgrowth of the carpet-bag régime from that identical basis. If this régime was an attempt to keep society standing on its apex, Mr. Lincoln seems to us first to have placed it there by recognizing one-tenth of the Presidential voters in 1860 as the government of any given State in process of restoration. The rest of the paper is an attack on Grant's military capacity. Mr. Longfellow contributes to this number a poem called "The White Czar," and "Another Rosary of Sonnets," among which those dedicated to the Two Rivers show a noticeable reminiscence of Wordsworth. In calling midnight

> "The Watershed of Time, from which the streams
> Of Yesterday and To-morrow take their way,"

the poet disregards the scientific distinction between "watershed" and "divide," with some loss of sharpness in the image. Mr. Bishop's story of "Detmold," which opened in a fresh and taking manner, already appeared to us to drag in its third instalment; and now, in its fourth, with the conclusion only dimly and distantly foreshadowed, certainly calls for a change of title. "Verona, an architectural romance," suggests itself. We fear that Mr. Bishop's mission to deliver himself on the subject of art weighs upon him much more powerfully than the secret of Alice's and Detmold's fate, locked up as yet in his bosom alone. Like George Eliot, too, he prefers philosophizing to action, and this makes one prepared for indefinite protraction of a drama whose unity of time and place is so rigorously maintained.

—Mr. Edward King's second paper on the Russians in Bulgaria, in the March *Lippincott's*, is less interesting than the first, because it consists to a much larger extent of hearsay and less of personal observation. It is, however, worth reading; and so, among the other articles, is an eyewitness's account of the taking of Fort Fisher. The writer was on board the new *Ironsides* throughout the bombardment, overlooked from the maintop the assault by our land forces, and visited the fort after its capture. His descriptions are clear and graphic, and ought to make recruits for the peace society. In *Harper's*, Mrs. Lamb's "State and Society in Washington" conveys a good deal of curious information about the State Department building, and asserts that "our capital is the seat of the most refined and polished society in America." This will doubtless be contested by other capitals; and, with the most perfect agreement as to the definition of terms, there would still be an obvious need of wide and intimate experience to justify disputants in espousing either one side or the other. Mr. C. F. Thwing's article on "Summer Schools" is valuable for reference as to the origin and present number and variety

of these praiseworthy institutions, of recent growth. It even contains announcements for the coming summer. Both the foregoing papers are liberally illustrated, and this is the case also with Mr. Edward Abbott's "Grand Manan and 'Quoddy Bay," which, so far as our experience goes, does rather less than justice to the peculiar and fantastic charm of the waters which wash our easternmost limits. The constant mirage which robs the outlines of mainland and islands of all fixity, and dissolves them into a thousand unrecognizable and unsubstantial shapes, is barely suggested. But Mr. Abbott is wholly right in recommending summer tourists to seek these almost virgin resorts. He might, by the way, in quoting from Longfellow's "Evangeline," have mentioned the supposed identity of *Quoddy* and *Acadie*.

—The *Portfolio* (J. W. Bouton) has lately been gratifying its subscribers with numbers almost exclusively written by the editor, for whose easy, "self-reading" articles no acceptable substitute has ever been found. Some of these, anonymous or incognito, are distinguished by the frank editorial "I," whose presence in an unsigned paper can have but one intent. We observe Mr. Hamerton in error, however, with a statement (sifted by us before, we think) that no exhibited pictures of Meissonier's with woman for a subject are known. The example in the gallery of the late A. T. Stewart, representing a beggar-woman asking alms of a chasseur, may not have been exhibited within the *Portfolio's* ken; but the portrait of Mme. Henri Thénard attracted much attention in the Salon of 1861 and at the Universal Exposition. A welcome present to the January purchasers was Whistler's wholly admirable etching of "Billingsgate." In the same number, apropos of some woodcuts which are really taken from Mr. Clarence Cook's 'House Beautiful,' the writer observes that "protest must really be entered against the mode of placing ornaments upon the mantel and shelves which, as here depicted, may be considered to be held up as a model; in four out of five illustrations plates, fans, Venice glass, vases, candlesticks, are scattered in hopeless confusion and mutual enmity." The February number is as richly illustrated as that for January, with two extremely interesting etchings, several cuts, and a Durand heliograph. The Turner papers are continued in both, but these are now becoming too indicial—if there be such a word—giving us the page of the catalogue or index, when what we want is the thought which plays around the lines of the catalogue when Mr. Hamerton reads them.

—The most striking paper in the sixty-ninth number of the Proceedings of the American Antiquarian Society is that entitled "Dr. Le Plongeon in Yucatan." The sum and substance of it seems to be that Dr. Aug. Le Plongeon unearthed while at Chichen-Itza, in Yucatan, a big statue representing a reclining person, which was "admirably worked" and a "gem of art." On this "find" Dr. Le Plongeon unsuccessfully endeavored to base a title to appointment as Mexican Commissioner to the Philadelphia Exhibition of 1876. He now attaches to it a host of speculations and scientifically-worded reasonings, taking a number of things for granted which are as yet far from being so. Of course the alphabet of Landa is to him a sacred truth, but he goes still further and establishes a chronology exceeding in length that of China or Japan. He also shows himself much more proficient than any of his predecessors in the "reading" of didactic pictures. His interpretations of long files of these (done *after restoration by himself*) are achieved with the greatest ease and rapidity. How far his results are reliable we leave archæologists to decide. The Society itself discreetly remains non-committal on the question, and thus, while avoiding the disagreeable responsibility of supporting the outbursts of extravagant enthusiasm, secures the credit of introducing to the scientific world archæological discoveries important enough in themselves without the encumbrance of fantastical views.

—The members of the U. S. Entomological Commission have had a protracted meeting in Washington, preparing their first report for the printer. This commission consists of Professors C. V. Riley, of St. Louis, Mo.; A. S. Packard, jr., of Salem, Mass., and Cyrus Thomas, of Carbondale, Ill., and was created primarily to investigate and report on the Rocky Mountain locust or grasshopper, with a view of counteracting its injuries and preventing its disastrous invasions. A review of their field labors during the past season and a synopsis of the report have been submitted to the Secretary of the Interior, and show that the work has been thorough and satisfactory. The report will contain between four and five hundred pages, and will be amply illustrated with plates, maps, and wood-cuts. The principal chapters are devoted to the practical phase of the subject, and it is clearly shown how to manage successfully the young insects as they hatch out in the more fertile country beyond the Mississippi, while the way is pointed out to prevent the invasions of the mature insects into the same country. The commission appeared before the Appropriation Committee of the House and asked for an appropriation of $25,000 to complete the investigation, admitting frankly that there were yet some important questions which, for want of sufficient time and funds, it had been impossible fully to settle. With the sum asked for they pledge themselves to complete the special investigation, so as to obviate in future the necessity of appointing a similar commission, and, in addition, to study and report on the cotton-worm of the South, with a view of saving the loss it inflicts. As might have been expected from the standing of the commissioners, their labors have been conscientious and fruitful beyond the most sanguine expectations, and when we consider the vast importance of the grasshopper and cotton-worm problem the appropriation asked for seems reasonable.

—All scholars who have investigated the vocalism of the earliest literary period of the French language recognize the importance of the assonances or vocal rhymes of the poems of this period and employ them in their linguistic researches. The most extensive assonant poem of this period, the "Chanson de Roland," as it is preserved in the Oxford MS., exhibits the greatest faults in its assonances. This is quite natural, as it is only an Anglo-Norman copy of the original poem written in the eleventh century in continental France. Mr. Adolf Rambeau, in a dissertation for his doctor's degree ('Ueber die als echt nachweisbaren Assonanzen des Oxforder Textes der Chanson de Roland,' Marburg, 1877), has compared the Oxford text with all the other numerous MSS. and redactions of the "Chanson de Roland," and has shown that they all, directly or indirectly, rest upon one common original, which must be, for the most part, the work of the poet himself. He gives a sure principle by which the genuine assonance may be known. These reveal the state of vocalism in the eleventh century, and prove that the medley of contradictory dialectic forms which appear in the MSS. is due to the ignorance of the copyists. The comparison of the genuine assonances of the "Chanson de Roland" with the "Cantilène de Ste. Eulalie" and the poems of St. Leger and St. Alexis proves that the vocalism of these poems does not present any dialectical difference from that of the "Chanson de Roland," but only shows a different state of development as regards the time, while the vocalism of the poem in the Oxford text is the same as that of other Anglo-Norman poems of the same date, as, *e.g.*, those of Philip de Thaun. The importance of the principles elucidated in the dissertation for the correct reconstruction of the original text is very great, and so the dissertation (which is only the introduction to a larger work soon to be published) has a literary as well as a philological value.

—The last numbers of the *Romania* and *Zeitschrift für romanische Philologie* complete the sixth year of the former and the first of the latter, and afford an opportunity to compare these friendly rivals. The present number of the *Romania* contains a miscellaneous contribution from P. Meyer: "Mélanges de poésie française." Among the four poems mentioned is a fragment of one on the first Crusade recently discovered in the binding of a book bought in London. A fac-simile shows that the writing is French of the thirteenth century, and reveals the nationality of the hitherto unknown author. A. Morel-Fatio notices a MS. of the fourteenth century containing a fragment of the original Old-Catalan version of Raymond Lully's celebrated "Roman de Blaquerna," and E. Cosquin continues his "Contes populaires lorrains." These stories have reached the number of thirty-one and are doubly valuable to students of folk-lore from the extensive notes of the learned editor, who shows himself a worthy follower of Liebrecht and Köhler. The remainder of the number is made up of philological miscellanies and book reviews. In the *Zeitschrift für romanische Philologie* A. Stimming concludes his study of the syntax of Commines, and remarks that so far as phonetics and inflexion are concerned Commines is substantially modern; but in his syntax he follows the Old-French usage. U. A. Canello furnishes an article on the Italian tonic vocalism, in which he only treats of the long accented E, reserving the remainder of his study for another occasion. A. Weber communicates two inedited versions of the Theophilus legend. The first is a Latin poem (in accented iambic trimeter) of the fourteenth century from the Paris National Library, the second is an Old-French metrical version from the Egerton MS. 612 of the British Museum. Both are of interest for this wide-spread legend of the forerunner of Dr. Faust. In the department of *Miscellen* H. Varnhagen notices the MS. acquisitions of the British Museum, from 1865–1877; in the field of Old-Romance literature. The number of MSS. mentioned is fourteen for Old-French and thirteen for Old-Italian, among the latter a prose

version of the Seven Wise Masters differing somewhat from those already known. There are, besides, the usual number of text-criticisms and etymological studies. The bibliography which formed so important a feature of the *Jahrbuch für romanische Literatur* is to be issued separately, owing to the lack of space in the *Zeitschrift*. We must not omit mention of an important feature of this number, and one which deserves to be imitated in all similar journals, we mean the three indexes of the volume —one of subjects, one of passages cited, and one of words. The latter facilitates reference to the important department of etymologies. Both journals deserve the highest praise; the *Zeitschrift* is a worthy successor of the *Jahrbuch*, and the *Romania* is worthy of a country that has produced a Sainte-Pelaye and a Raynouard.

GENERAL LEE AND HIS ARMY.*

THIS book is a disappointment. To say so is to say the worst that can fairly be said of it, but it is unfortunately true. General Lee is one of the prominent characters of American history. The story of his life and the question of the place which he should occupy on the steps of fame are matters of interest to all Americans, on whichever side they may have ranged themselves in our civil war. The South regards him as the greatest commander in our war, and Colonel Taylor calls him the first man of his day and generation. Colonel Chesney says that his campaigns "placed the name of Lee in the very foremost rank of the world's great commanders." We at the North, knowing some of us more about the nature of the struggle than any Englishman can, and viewing the question naturally from a different point from our brethren at the South, hesitate to admit so much. We remember his failure to attack after our repulse at Fredericksburg; we doubt the wisdom of his action at Chancellorsville, glorious to him and disgraceful to Hooker as was the result of that bold enterprise; and we cannot forget how he wrecked his army at Gettysburg. But, all deductions made, enough remains to leave us proud of him as an American soldier, and, but for the doubts which linger as to his responsibility for the treatment of our prisoners, we incline to be equally proud of him as a man. We would gladly know more of him, as a soldier and as a man, and Colonel Taylor's book raised expectation to a high point. He had a right to call his book 'Four Years with General Lee,' for it was his "peculiar privilege to occupy the position of a confidential staff-officer with General Lee during the entire period of the War for Southern Independence." He led us to expect a book that should be at the same time most valuable and most interesting. If it be true, as a clever Frenchman has said, that "interest is the lowest of literary pleasures," an exception may surely be made in favor of biographies, and especially of the biographies of very conspicuous persons. We expect such books to be interesting, and when they fail to be so we are disappointed, and we think we have a right to be so. It is hard to believe that a confidential staff-officer of General Lee should have put together two hundred large and closely-printed pages, covering the whole period of the war, and yet have told us so little of General Lee. If the author has erred, as we think he has, it has been not from carelessness or want of industry, but, as it seems to us, from an error of judgment, or a want of perception of the true use to make of the material which he must have possessed. There are scraps of information which we believe to be quite new and which are full of interest, but there are only enough of them to make us long for more. Painstaking, candid, and straightforward as Colonel Taylor appears to have been, he has left unsaid much which he ought to have said. In the latter half of the book he introduces extracts from his diary, beginning in October, 1863, and these we read with delighted interest, and only wish that he had begun to do so earlier and had done so more.

In so far as the book is "a summary of the more important events touching the career of General Robert E. Lee," it does not add materially to our previous stock of knowledge, and does not seem to show that Colonel Taylor's experiences had developed in him a very sound military judgment. He thinks that if Stuart had not prematurely, before the infantry was up, opened fire from a few guns posted on high ground on our forces assembled near Harrison's Landing, at the end of the Seven Days, and so called our attention to the importance of the position, General Lee would have "made sure of this naturally strong line, fortified it well, maintained it against assault, and dictated to General McClellan terms of surrender." General McClellan was sluggish in posting his army on its arrival at Harrison's Landing, and there was a good deal of confusion on that day of dismal rain and mud; but not even Stuart's guns arrived that day, and the next day the weather was perfect and the army was in very fair order, and to those who remember the "lay of the land" about the Evelinton hills, the heights of which Colonel Taylor speaks, and how much easier it was for us to seize and hold them than for Lee; who remember how powerful our army was and how elated by the result of Malvern Hill, fought two days before, and, above all, who bear in mind what was the condition of Lee's army on the morning after Malvern Hill ("the whole army," General Trimble says, in his official report, "in the utmost disorder, thousands of straggling men asking every passer-by for their regiments—presenting a scene of the most woful and disheartening confusion"), the suggestion that Lee, twenty-four hours after, could have taken such action as would have enabled him to dictate terms of surrender to McClellan, who had reached his supplies and had the guns afloat to help him, is one that can only provoke a smile. The idea is seen to be the more preposterous when we read Colonel Taylor's estimate, on p. 56, that Lee, with sixty-two thousand men, was pursuing McClellan, with eighty-five or ninety thousand.

We are surprised, too, to find Colonel Taylor declaring, at this late day, that "considerable delay was occasioned in the pursuit from the fact that the ground was unknown to the Confederate commanders." Lee's army was full of Virginians; the operations of the Seven Days were conducted, as it were, within sight of Richmond. One of the great places of Virginia, the Selden place, if we remember rightly, was within the ground occupied by McClellan in his encampment on the James, and, finally, there was with Lee's army a company of the Fifteenth Virginia Regiment, called the Henrico Light Guards, made up presumably altogether and certainly in part of men who lived near Malvern Hill and knew the country intimately. Under these circumstances, if the Confederate commanders were ignorant of the ground, it was their fault and not their misfortune.

It does not raise one's respect for a military writer to find him ready to endorse, so far as citation endorses, an absurdly exaggerated statement. He quotes from A. P. Hill's report of his repulse of a Union force sent across the Potomac to harass the Confederate rear-guard after the battle of the Antietam: "By their own account, they lost three thousand men killed and drowned from one brigade alone." Who gave that account? What Union brigade ever went into action three thousand strong? Was every man in a force of three thousand men ever destroyed in a day?

Colonel Taylor seems to think that Pickett's magnificent charge at Gettysburg actually carried the position, and that the Confederates failed to win a complete victory only because Pickett was not properly supported. Such an illusion might have been pardonable a dozen years ago, but time and the full information it has brought should have taught him better. He speaks of "entering the works of the enemy," of "leaping the breastworks," of "gathering the fruits of a victory so nobly won," and of "resisting all efforts of the enemy to dislodge them." This is certainly visionary so far as it relates to what was done, and almost certainly visionary so far as it relates to what might have been done if Lee had ordered and his men had obeyed otherwise than as they did. It is as nearly as possible true that we had no "works" and no "breastworks" at Gettysburg on the part of the line which Pickett attempted to carry. Space does not suffice here for a full description of the exceedingly slight turning of earth which some of our men had accomplished, loosening the earth with bayonets, and throwing it up with a broken canteen. As little foundation is there for the pretence that a victory was won. In our opinion Pickett's advance was one of the most magnificent feats of arms recorded in history, but it failed. No "organized body" entered our works. There were no works there to enter, and only a very few gallant men succeeded in piercing the line and getting in among the guns which were placed behind an opening in the fence or wall which ran along the front of our position. We believe it to be reasonably certain, too, that if, as Colonel Taylor suggests, "the veteran divisions of Hood and McLaws had been moved forward, as was planned, in support of those of Pickett and Pettigrew," the result he pictures would not have followed: "Not only would the latter division, in all probability, have gained the enemy's works, as did that of Pickett, but these two would have been enabled, with the aid of Hood and McLaws, to resist all efforts of the enemy to dislodge them." But this is not the place for fighting the battle of Gettysburg over again, and we must pass to a brief consideration of what is really the most important part of Colonel Taylor's book—to wit: his

* 'Four Years with General Lee: Being a Summary of the More Important Events touching the Career of General Robert E. Lee, in the War between the States; together with an Authoritative Statement of the Strength of the Army which he Commanded in the Field. By Walter H. Taylor, of his Staff, and late Adjutant-General of the Army of Northern Virginia.' New York: D. Appleton & Co. 1877.

"authoritative statement" of the strength of the army which Lee commanded in the field.

We believe Colonel Taylor to be a thoroughly honest man, and that he has not only meant to tell the truth, but that he has taken great pains to ascertain the truth, and that he believes he has succeeded. We believe that he is mistaken. We believe that he is, quite unconsciously to himself, too ardent a partisan to deal successfully with his difficult subject, and we believe that what we have written about his book gives color, at least, to this belief. There is a great deal of minute detail as to numbers given by him, and his results have an air of authenticity, and yet we are confident that he has made many and grave mistakes. To criticise this portion of his book as it must be criticised to do it full justice would be a work of great labor, and one for which we have no special fitness. We never served in the Adjutant-General's department, and never had to do personally with any larger return of men than a brigade morning report; but when we are told that the Confederates at the Antietam "had from first to last less than fourteen thousand men" on their left flank, we simply say we do not believe it. There is a mistake somewhere. The corps of Hooker, Mansfield, and Sumner attacked this force, the ground was reasonably open, the engagement was short, and yet these three corps lost (including the few lost by Hooker in his movements of the preceding evening) nearly nine thousand men in killed and wounded, not counting the missing. These men did not run away. They gained a little ground from the enemy. They were not raw troops. They had learned to shoot as well as stand up and be shot at. However it may seem to others, the statement that this force, numbering some forty thousand men, not storming entrenchments nor much exposed to artillery fire, not routed and pursued, but upon the whole gaining ground from the enemy, had some nine thousand of its number killed and wounded by an opposing force of fourteen thousand, seems to us simply incredible.

Another reason for dissatisfaction with Colonel Taylor's statement of numbers is that he frequently takes them from published reports of general officers, and that he seems to have preserved no memoranda of the morning reports of Lee's army, which he probably received nearly every day. How far the "informal return" of the strength of the Southern army near Richmond May 31, 1862, or the "field and monthly reports of the Department of Northern Virginia," which he found in the archive-office of the War Department at Washington, take the place of morning reports, we are not competent to judge.

This question of the comparative strength of the Army of the Potomac and of the Army of Northern Virginia in their various engagements is one of great interest, and it is not answered yet. The man who answers it must be not only a diligent student and a careful and candid man, but he must have much knowledge that can only be gained in service. We incline to the opinion that when the truth comes to be fully known, it will appear that the Confederates far exceeded the Federals in the percentage of the number reported present which they habitually took into action. What with our sick in quarters and in regimental and field hospitals, and our lavish details for extra duty, our orderlies and company cooks, our wagoners and hospital nurses, and our large gangs about the quartermaster's and commissary's depots, our number reported present was apt to be far in excess of the numbers which went into action. Few colonels ever saw a line formed for dress-parade which corresponded to their morning report. The Army of Northern Virginia fought wonderfully, whether it was the excellence of the leaders, or of the men, or of both; and few know it so well as the members of the Army of the Potomac. We did require largely superior numbers to beat them, and we know it; but we are not ready to admit that fourteen of them were a match for forty of us. On the contrary, we think we have proved, over and over again, that when we were even tolerably managed we could meet them on very even terms. It has been well said that the general result of the fighting between these two armies was that the assailant was repulsed. Their merit was so equal that the advantage of position could not be overcome by the enthusiasm of attack. At Fair Oaks, their whole army, so far as they chose to use it, attacked four divisions of ours, with no advantage of position on our side, and we beat them off with the aid of a fifth small division at the finish. At Gaines's Mill, McClellan allowed Porter to be overwhelmed by largely superior forces of the enemy, while the bulk of his army listened to the firing from behind the fortified lines which he had kept them building for a month, to make no use of them when the day came for using them. At Malvern Hill, a small part of our army handled very roughly as many men as they saw fit to send against us. At Nelson's Farm, according to the best information attainable, a superior force of Confederates failed to drive an inferior force of Federals from a position that had no strength of its own. At Fredericksburg, we attacked them just as they wished to have us, and they repulsed us easily. Chancellorsville was a great victory of Lee over Hooker, and not of his army over ours. At Gettysburg they attacked in several places for three days, and were obliged to draw off at the last. After Gettysburg the warfare became one of constant attack and defence of positions, and they had practically always the interior line. Antietam was a drawn battle, except that for an invader not to succeed is to fail.

Our remarks upon this book have extended to very considerable length, for the reason that its subject is most interesting, and its author a man of character and one whose position entitles his work to respectful attention. We believe that he has not exhausted the subject which furnishes the most important part of his book, but that he has done much to aid the future enquirer.

FREEMAN'S ARCHITECTURAL SKETCHES.*

To no subject can Schiller's well-known distich be more truly applied than to Architecture:

"Einem ist sie die hohe, die himmlische Göttin, dem Andern
Eine tüchtige Kuh, die ihn mit Butter versorgt"

But Mr. Freeman holds her in a middle place. To him she is the handmaid of history, and one of the most trustworthy. He, indeed, began his historical labors with a 'History of Architecture,' which his present volume leads us to believe he has done wisely in not republishing since he became famous. The little book of Sketches, coming from so eminent a hand, might be expected to show a competent knowledge of the subject to which it is mainly devoted. But we do not always find what we have a right to expect, and Mr. Freeman's Sketches, so far as they are architectural, might tempt one to believe that he had perpetrated an elaborate and somewhat pedantic hoax, and that he desired to ridicule the musings of a learned though desultory mind on a professional subject of which it had but a comparatively superficial knowledge. The wandering of the attention from the theme under consideration, the rarity of original thought upon the monuments discussed, and, when it is put forth, the exaggerated importance attributed to minor points, finally the author's drawings—all appear a characteristic parody of the dilettante; perhaps, indeed, somewhat caricatured by the so-called "illustrations."

The rambling remarks suggested by the historic associations of the cities visited are serious enough, however; we are newly astonished at Mr. Freeman's enormous capacity for facts, and at his confident insight into the significance of political events and transmutations. He truly says: "The man who tries to fix the dates of buildings without knowing what the dates mean—that is, without knowing what the state of things was when the buildings were set up—can never reach to an accurate understanding of his own special walk." To speak of the historical elements of the book is not our present object; that but few exceptions can be taken to Mr. Freeman's accuracy when on his own ground all will understand who are familiar with his previous writings, but there is a tendency to repetition and to exaggeration which betrays the haste with which these essays were originally written, and the want of adequate remodelling before their present republication. It is evident that Mr. Freeman has given considerable attention to architecture, considerable study to the great stone book in which some nations have written their only chronicles now remaining to the historian, but it cannot be said that his reflections thereon are to be accepted without reserve. He supposes himself to have made one discovery to which he frequently calls attention; it is the ground-tone of the book, and must be admitted to differ from any opinion of the history of architectural development hitherto proposed or received. "The age of Diocletian," he maintains, "the age which reared the court of Spalato, though its bricks may be wider apart than bricks were in the golden age of Nero, is seen to be the age of the greatest architectural development the world ever saw." That is to say, the years A.D. 305–310, a period one would least expect to find chosen for such an honor, a date midway between the building of the Pantheon and of the St. Sophia, the longest and dreariest blank in the history of architecture. He has coined a new name for the Roman manner before its decadence, viz.: "pre-Spalatine," and he asserts that, "next to the introduction of the arch itself, the greatest invention in the history of architecture was the improvement by which the architect of Diocletian's palace at Spalato ventured to make an arch spring at once from the capitals of a pair of columns." (By "pair of

* 'Historical and Architectural Sketches, chiefly Italian.' By Edward A. Freeman, D.C.L., LL.D. etc.' With twenty-two illustrations from drawings by the Author. London and New York: Macmillan & Co. 12mo, pp. vii.–315.

columns" Mr. Freeman does not mean coupled columns, as the term usually implies; his exact purport must often be read between the lines.) This invention, if such it is to be called, was certainly no sudden or isolated venture. It is adopted in many structures of that period, and instances of its previous appearance are known. Arches had sprung directly from the capitals of antæ and pilasters since the time of their first introduction, and the substitution of pillar for pilaster lies near at hand. Nor was it, indeed, an immediate advance. Diocletian's architect himself does not seem to have considered it a betterment, for in this upper arcade he replaced the representative entablature, probably not imagining that the omission of it below would be pronounced the greatest improvement the world ever saw. The fact is, arch and column are not well agreed; an archivolt upon Ionic or Corinthian capitals is a weakly-curved architrave. An arch demands of columns functions for which they are not adapted, they being by their nature prepared to resist vertical pressure only. The delicate abacus cannot ideally withstand a side thrust; the interlocation of the stilt, as an impost, mediates, and, far from being cast off in post-Spalatine architecture, continually appears in the best examples where these dissonant features are combined. It is only when the imposed mass is very light, as at Spalato, that the arch can securely spring from the classical abacus. Yet, however distorted by our writer, an element of truth remains. It is true that in the beginning of the fourth century the lintel, the horizontal line of the Greeks, began to lose somewhat of its evil influence over the Roman arch. The entablature was shuffled off, rather by time than by the ability of Diocletian's architect, and the weary groping after the proper support for the arch began.

Mr. Freeman rightly insists upon the continuity of architecture as parallel to the continuity of history inculcated by his former writings, but often chooses examples unfitted for his purpose, and overrates features which he considers proofs. He terms the Carlovingian minster of Aix-la-Chapelle "a direct copy of the greatest building of Ravenna," and says that "for more than one building in Aachen Ravenna actually supplied the materials." These are misleading statements, which were better modified. The further exemplification of the polygonal choir of the minster, as showing the development of the basilican apse, is without point; the peculiar form was due to its erection on foundations intended for another purpose. The praise bestowed on the proportions of Milan cathedral will surprise alike the architect and the man of taste. The cathedral of Trient is well known as one of the most markedly transitional churches of its style; the arrangement is entirely German, the execution and details for the greater part Northern; yet it is here considered as unmixed Italian Romanesque, and on this view hinges one of the historian's essays.

A further examination into such points would lead too far. The thoroughness of Mr. Freeman's appreciation of his subject may be questioned from the text, yet it is by the illustrations (photographic reproductions of his pen-sketches) that the imperfect comprehension of architectural forms is most clearly seen. It would seem that no one with even rudimentary knowledge could publish such misrepresentations. They are one and all beneath criticism.

Mr. Freeman's literary style, never graceful, is here at its worst. He speaks repeatedly of columns or capitals as "used up again," refers to a cycle as "played out," etc. Many sentences are well-nigh pointless, while the repetition of words is carried to such an excess as to become ludicrous. The reader's attention is distracted by such consecutive passages as these: "Looking to the *building* distinctly as a work of architecture, the Veronese amphitheatre, like all other *buildings* of the same class, brings out in its full perfection the massive grandeur of the *true Roman style of building*. It is the arch, the *true Roman feature*, which gives the *building* its character. The Greek *features* in the more enriched *Roman buildings* act as a mask." And so on down the page. Or again: "Ravenna is a city in which we find ourselves among the *memorials of an age* which has left but few *memorials* elsewhere. The sea which once gave Ravenna its greatness has fallen back, and left the imperial city like a wreck in the wilderness. In like sort the *memory of an age*, strange if not glorious, full of great changes if not of strange deeds, has passed away from other spots without leaving any visible *memorial*; at Ravenna the *memorials of that age* are well-nigh all that is left," etc. A fondness for the ancient or foreign names of cities, in preference to the terms in present English usage, is made very noticeable; thus, we read Ariminum, Faesole, Cumae, and so on, while German towns are called Trier, Aachen, Köln, with an affectation that ill accords with the repeated misspelling of Innsbruck, and the use of the noun Dom with a small letter.

Mr. Freeman is a great historian, his writings may be said to have created an epoch in English history; in one of them, a former volume of essays, he expresses his contempt for "loose and inaccurate writers, who theorize about facts they imperfectly know" or understand. Our criticism is not incompatible with profound respect for Mr. Freeman's services in his chosen province, but he should recognize its limits. As far as this aggressive little volume concerns itself with architecture it is unreliable, almost illiterate, and its illustrations are an affront to the reader and to art.

On English Adjectives in -able, with special reference to *Reliable*. By Fitzedward Hall, C.E., M.A., Hon. D.C.L. Oxon., etc., etc. (London: Trübner & Co. 1877.)—We despair of giving any concise account of the contents of this work. The author himself did not foresee them, and in fact supposed that he was writing a chapter of a paper on '*Reliable, Dilation*, and their Respective Congeners,' when presently he found that he had a book on his hands. Moreover, he was taking up the cudgels on behalf of a word for which he professes no particular affection, and which, as he tells us on p. 172, he has used but once "in the course of some eight thousand printed pages, mostly quite unknown and altogether likely to remain so." And on this single occasion, to show that the use of it was not a lapse, he stepped aside to discuss, "at some length, the disputed legitimacy of the expression." Digressions of this sort are still in order, now that *reliable* has become the subject not of a foot-note but of a book. "On no small number of interesting topics here discussed," says the preface, "one will fruitlessly explore, in quest of information, any and all of our grammars and dictionaries, including both the latest and the most copious." This is pre-eminently the merit of Dr. Hall's philological writings, and it has some very remarkable illustrations in the volume before us—so many, in fact, that his apologetic *sed hoc extra callem* on p. 67 almost excites a smile.

For example, who would expect to find, and who will not prize highly when it is thrown in, a discussion of the derivation of the word *recover* filling nearly twenty pages of fine print, and running off into an excursus about the use of *recover* in such phrases as "to recover our surprise." Similarly, and more appropriately, *rely* is discussed in three solid pages. The etymology of *topsy-turvy* calls for nine, and very intricate it is, being subject to amendment even in the appendix. Incidentally, the former use of the word *party* for *person*, which has now become vulgar, is illustrated by five pages of select passages, including some which now "look scarcely reverent," as "He that is here meant by 'the horne of salvation' is Jesus Christ. . . . If he, then, be the *party* whom all the prophets pointed at, as the alone restorer of mankinde," etc. Most welcome and most valuable are the rules for spelling with *-able* or *-ible*, and curious are the long lists of disused adjectives in *-able* that good writers have hazarded in times past. Among the well-established "neuter rhematic adjectives" (*i.e.*, adjectives having a verb for the base) with this ending, the mention of *agreeable* reminds Dr. Hall that the familiar meaning of "consenting," "willing," is by no means an innovation. "Sir John Paston wrote, in 1465: 'I kannot in no wyse fynde hyr *a greable* that ye scholde have her dowter [daughter].'" On p. 28 an old controversy is touched on by the citing of still earlier examples of the use of *is being* and *was being* (1769 and 1779); while Henry More (1653) furnishes an instance of the present passive participle ("acting and being acted upon") which naturally led up to the constructions just exemplified. Finally, let us notice the side-remark on the irregularity of the Latin *meridionalis*. "Was it suggested by *septentrionalis*, on a false analogy?"

But it is time that we should ourselves have something to say about *reliable*. Dr. Hall approaches it by selecting a type of the class "who talk and write as if they thought that a knowledge of philology comes by inspiration, and has inspired themselves in particular," and his victim is no other than Mr. Fitzjames Stephen, who had had the hardihood to denounce as nicknames the words *necessist* and *phenomenist*. It is not long before Mr. Edward A. Freeman's scalp is made to dangle from the same girdle, for having declared *reliable* an "American corruption"; and the average Briton's soon forms a third trophy, without which Dr. Hall cannot comfortably settle down to his task. A popular London journal is credited with the assertion that no scholar and no gentleman would ever think of enduring so unnecessary, monstrous, and plebeian an expression. "And here," breaks in, or breaks out, Dr. Hall (p. 40)—

"And here, not unseasonably, I would make a remark on the spell which, it seems, may be cast on almost any Briton by the term *gentleman*. Whoever it may be that takes upon himself to pronounce that this thing, or that, or the other is 'unbecoming a gentleman,' an Englishman who, on hearing such a judgment passed, is not immediately subdued into ac-

quiescence, may be accounted a man of unusual boldness and independence. Whatever is condemned by this potent formula, no matter who the condemner may be, the effect upon it is, very commonly, regarded as much the same with that which, in ancient times, was, in some parts of the globe, supposed to be supernaturally wrought on a person who had been cursed. The character of the curser was nothing; but the curse was everything, and, by its own intrinsic efficacy, entailed, it was thought, inevitable fulfilment."

The earliest occurrence of *reliable* in our literature that Dr. Hall has discovered is in a "speech by William Pitt as manipulated by Coleridge," that appeared in the *Morning Post* of February 18, 1800. That Pitt himself used the word is not confirmed by the contemporary reports. Coleridge used it frequently afterwards, and introduced also *reliability* and *unreliableness*. In the first instance he coupled *reliable* with "pledge," thus indicating what Dr. Hall considers its proper employment: to qualify things, as *trustworthy* qualifies persons. The two words are not strictly synonymous, and *reliable*, if not indispensable, is very convenient and has been adopted by the best circles. There is a sufficient number of adjectives in *-able* whose formation is strictly analogous to that of *reliable*, and which yet pass current unopposed; there are still other cases, like the word *laughable*, that offer some doubt, since the base appears to be the noun rather than the verb, though the objector may fairly be challenged to prove this. Any Shaksperian commentator who interprets Hamlet's "*questionable* shape" by "easy and willing to be conversed with," assumes as the base "the rhematic phrase *question with*," and furnishes an exact match for *reliable*. Dr. Hall sums up by saying that *reliable* expresses what cannot be expressed by any other one word, conveys an idea of constant recurrence, and can only be avoided by the exact by a periphrasis; it is far from being dissonant, and has been recognized as acceptable by the popular instinct. "That it fails to comport with an analogy of other than narrow scope, is the single point where, philologically considered, it is weak." Regarding it as a prisoner at the bar arraigned for wilful murder, our learned judge directs an acquittal on the ground of justifiable homicide; and the popular verdict is that "though, as all impartial observers admit, it was very irregular for X to slay Y, still it is felt to be for the public good that the troublesome creature [periphrasis] is no longer in the way"—a verdict not unlike what we may suppose posterity's to be on the Russo-Turkish war.

This small but pregnant book deserves the admiration not only of those who have been annoyed by purists and disgusted by philological charlatans, but by all who desire an accurate knowledge of the development of their mother-tongue.

Field Paths and Green Lanes; Being Country Walks chiefly in Surrey and Sussex. By Louis J. Jennings. Illustrated with sketches by J. W. Whymper. (New York: D. Appleton & Co. 1878.)—The mere title of this book will win the love of Americans, for whom the descriptions of English lanes are apt to be the best part of English novels. Pedestrian travels, too, are always good reading; these alone can give the real details of a landscape, and it is only the pedestrian in these days who has time to chat with anybody. Mr. Jennings, moreover, gives us some really charming sketches of places that can never be too often described, such as Penshurst and the Deepdene; and he also gives some racy conversations with rustics, in which he himself sustains the unusual part of a travelled Conservative and a half-Americanized Tory. He is frank and honest, too, and does not shrink from showing when his way-side friends have parried his thrusts promptly. Thus, one of them says longingly, of a son who has emigrated: "He's a doin' well—they say you can have your own cottage out there. *If you pay for it?* Ah, but here you can't have it, whether you pay for it or not" (p. 165). This is the precise point—the hopeless pre-occupation of every foot of land—which so often depresses the heart of an American amid the loveliest scenery of England. Mr. Jennings's stereotyped answer, "Why not?" though it may exculpate the individual landholder, does not evade the evil.

There is not, however, much political philosophy in the book, but the author's residence in the United States supplies him with some other materials, quotations from Emerson and Thoreau, backwoods jokes, and a habit of looking for the English origin of alleged Americanisms. He finds in Sussex "mad" used for "angry"; "fall" for "autumn"; "reckon" for "think"; and "gives out" for "fails." All these are usually cited as Americanisms; and it is, indeed, rather a source of regret that the pretty word "fall" is not indigenous. On the other hand, Mr. Jennings himself uses what is often mentioned as an undeniable Americanism, the word "opened up" (p. 289). In general, he is stanchly English, even in vindicating the charms of his native climate; but he heaps contempt on English fishing-boats, saying of those about Hastings:

"No improvement can have been made for two hundred years. To see one of these big, hulking, unwieldy craft, and then think of the American fishing-boat, with its graceful lines and its white sails, easily managed and capable of great speed, excites one's astonishment afresh at the obstinacy with which our countrymen cling to whatever they may have been in the habit of using, no matter at what loss or inconvenience" (p. 22).

Nothing in the book has more flavor than the few glimpses of the local reputation, or want of reputation, of Mr. Tennyson at his summer retreat of Blackdown. Even at the Isle of Wight, only a few years ago, an American traveller found that the intelligent young fellow who drove a fly from Newport to Farringford had never heard the poet's name; and it is not strange that Mr. Jennings was answered at Haslemere: "Tennyson? Tennyson? I never heerd of that name." However, when it came to a choice of a coachman, the English tourist was more fortunate, for his driver told him, when in view of the laureate's house:

"The old gentleman doesn't like to see strangers about his place, but he won't say anything to you. In fact, he seldom speaks to anybody, but goes walking about with his head down. Writes books, I believe—not that I've read 'em. Something about poetry, an't they, sir?" (p. 130).

Let us not, however, indulge in premature exultations. The innocent stranger in New York still has his attention called, in public places, to that eminent New York alderman who pointed out to an English nobleman the bust of Alexander von Humboldt, in Central Park, with the remark that he did not see what Dr. Helmbold had done to deserve that position, being nothing at best but an apothecary.

The Bride of the Rhine: Two Hundred Miles in a Mosel Row-boat. By George E. Waring, jr. Reprinted (with additions) from *Scribner's Monthly*. (Boston: J. R. Osgood & Co.)—Colonel Waring is, on the whole, the best of that band of travellers who report themselves in *Scribner's Monthly*. His 'Farmer's Vacation' won just praise and popularity, though it dealt with regions comparatively familiar. It might also be charged with the defect of being too literary for farmers and too agricultural for all others. But we have here a trip undertaken for pure enjoyment—it is not even called a vacation, though it is one; whereas the other trip, though a vacation nominally, yet brought out a good deal of hard work. "The Bride of the Rhine," as the German poet Otto terms the river Mosel, is the subject of a book quite as attractive as its predecessor.

A summer holiday, indeed, was this boating on the beautiful river—"the blue Moselle" of songs, the "Mosella" of the Latin poet Ausonius. The stream is simply an unspoiled Rhine, with heights as picturesque, vineyards as continuous, ruins as picturesque, and villages far more unchanged and mediæval. Brick and timber architecture, quaintly carved, is to be seen on every side, and those picturesque fronts at which the American visitor stares so eagerly in the half-modernized Chester are the ordinary style of village houses on the Mosel banks. These delights culminate in the wonderful Schloss Eltz, a building without its peer in the world, having remained for eight centuries in the uninterrupted possession of the same family, and preserving unchanged their accumulated relics—portraits, arms, furniture, and traditions. It stands on a hill, in the centre of a wooded valley; it is accessible only by a high and narrow drawbridge, and had the drawbridge fallen to give passage to a cuirassed robber-knight and his retainers, going out for plunder, our travellers would scarcely have been astonished. A capital engraving of this unique castle forms the frontispiece to the book, and a multiplicity of other woodcuts enables us to justify for ourselves the enthusiastic descriptions of the author. In the rapid disappearance of old-time beauty from the more travelled routes of Europe a debt of gratitude is due to one who thus pursues the picturesque into its delightful by-ways.

Geschichte des Vatikanischen Koncils. Von J. Friedrich. Vol. I. (Bonn, 1877; New York: B. Westermann & Co.)—In this volume, the beginning of a more extended work, Dr. Friedrich presents the *Vorgeschichte*—the preliminary events that led to the Great Council and paved the way for the dogma of Infallibility. In the table of contents, which covers thirty-two pages, a summary view is presented of the subjects treated in the work. It is a history of Ultramontanism, which starts with the period antecedent to the French Revolution; describes the movement of Lamennais, De Maistre, and their successors in France; traces to its origin the corresponding movement in Germany and Switzerland, and reviews the administration of Pius IX. prior to the assembling of the Coun-

cil. It embodies much interesting information. Friedrich was in attendance at the Vatican Council as a theologian attached to Cardinal Hohenlohe. He is a pupil, colleague, and friend of Döllinger. His hostility to "Vaticanism" is too strong to render it possible for him to give an entirely impartial delineation of its rise and characteristics. In truth, he founds his claim to be considered impartial on his low opinion of his adversaries, whom he pronounces incapable of improvement from any polemical treatment of their doctrines and conduct. Apart from the ardor of feeling, Dr. Friedrich is an instructive guide.

Two Years behind the Plough; or, The Experience of a Pennsylvania Farm-boy. Giving a true and faithful account of life on a Bucks County farm as he found it during an apprenticeship of two years. (Philadelphia: Claxton, Remsen & Haffelfinger. 1878. 12mo, pp. 224.)—The "two years behind the plough" were passed by a Philadelphia boy who had a longing for a country life, upon the farm of a Bucks County Quaker. The merit of the story is in being a well-told and apparently truthful picture of a particular phase of American life a generation ago; and this gives real value to a story which is itself commonplace, with little incident and no effort at elaborately-drawn characters. Nevertheless, the characters are vividly presented, and are good types of their class—the hard-working, close-fisted small farmer and his wife, who had little thought of anything but money-making, who were saving to the degree of meanness, with a temper which was at times harsh and unjust, and nevertheless with human virtues; so that the boy who had spent under their roof two years of hard work and shabby fare had a kindly enough feeling towards them to come back when he was a man, and visit his old master as a welcome and not unwilling guest.

The Hon. Miss Ferrard,

A Novel of English and Irish Life, by a new author of exceptionable promise, is now ready in the Leisure-Hour Series. 16mo, $1.

Chauncey Wright's Philosophical Discussions

will appear immediately in a new impression, the first impression being exhausted. The London "Academy" calls the author's "one of the finest philosophical minds which America or any country has produced." 8vo, $3 50.

HENRY HOLT & CO., NEW YORK.

NOW READY

NEW EDITION OF HIGGINS'S GREAT WORK.

The Anacalypsis;

An attempt to draw aside the Veil of the Saïtic Isis; or, An Enquiry into the Origin of Languages, Nations, and Religions. By GODFREY HIGGINS, Esq. Vol. I., 8vo, cloth, $4 50. 550 pp. To be completed in four volumes.

The extreme rarity and consequent high price of the 'Anacalypsis' has hitherto placed it beyond the reach of many scholars and students. The new edition is issued in a much more convenient form, and sold at less than one-sixth of the price of the original.

The powerful though rather dogmatic logic and the profound learning of the author give the work a singular importance; and in a thinking age, when many things formerly considered truths are passing away into the shadows of tradition, the student of comparative mythology and the origin of religion and languages will look upon Higgins's 'Anacalypsis' as his guide and luminary through the darkness of dawning science.

J. W. BOUTON, 706 Broadway, N. Y.

Mr. Snider's work on Shakespeare has NOT received the unqualified approval of the press East and West, as previously stated. The New York papers have demolished it: the "World" in two columns, the "Times" in three columns, and other papers in less space. The Boston press commend it highly. The "Advertiser," "Globe," "Courier," "Transcript," "Times," and others pronounce it able, scholarly, interesting, valuable, showing deep study, having (what was not considered possible in a work on Shakespeare) great "originality." The Western press generally coincide in the views held in Boston. Individual critics are, as far as heard from, less divided in opinion. Dr. Wm. T. Harris gives general expression to their opinions in saying: "It is one of the most daring labors ever undertaken by a critic; and, if Mr. Snider had signally failed in every point named, still he would deserve admiration for his courage." Dr. Harris goes on to show that Mr. Snider has been signally successful. "When doctors disagree who shall decide?" The 'System of Shakespeare's Dramas' has been most extravagantly praised, and has been pronounced the most unmitigated bosh. What next?

INDUSTRIAL ART.

A NEW ILLUSTRATED MONTHLY OF

Technical and Scientific Education.

JANUARY NUMBER NOW READY.

$4 per annum. 40 cents per part.
Specimen number mailed on receipt of 30 cents.

J. B. LIPPINCOTT & CO., PUBLISHERS
PHILADELPHIA.

JUST PUBLISHED.

A VALUABLE WORK.

The Electoral System
OF THE
UNITED STATES.

A Critical and Historical Exposition of its Fundamental Principles in the Constitution, and of the Acts and Proceedings of Congress enforcing it.

By DAVID A. McKNIGHT.

8vo, extra cloth, $3.

"Mr. McKnight's book is valuable, both as giving a good history of the late Presidential contest and as being a well-digested treatise on our method of elections."—*Chicago Tribune.*

"A hand-book of standard authority. We cordially commend the volume to the attention of our public men."—*Pittsburgh Chronicle.*

"The plan of the 'exposition' is comprehensive, and it has been carried out with an ability which is backed by painstaking perseverance."—*Philadelphia Inquirer.*

"The author details in an interesting manner the origin of the existing system, points out its good features, and exposes the defects in its working. Finally, he lays down the plan which he thinks would remedy all the latter, preventing a recurrence of the troubles of the late Presidential election, and otherwise contributing to the peace and safety of the nation."—*Cincinnati Gazette.*

. For sale by Booksellers, or will be sent by mail, post-paid, upon receipt of the price, by

J. B. LIPPINCOTT & CO., Publishers,
715 and 717 Market Street, Philadelphia.

WARE'S ARTISTIC DESIGNS FOR

Scroll Sawyers.

These designs are engraved in the best manner, and are unrivalled for Beauty and Finish.

ILLUSTRATED CATALOGUE ON APPLICATION.

JOHN WILKINSON, Publisher,
53 and 55 Lake Street, Chicago.

Magazine of American History.

The First Volume of the Magazine has become so scarce that it can be supplied only with great difficulty. Orders for it will be received, however, and will be filled if possible as rapidly as the numbers can be procured and in the order in which the subscriptions are received. No additional copies will be printed, however.

SUBSCRIPTION PRICE, $5 A YEAR; 50 CENTS A NUMBER.

Published by A. S. BARNES & CO.,
New York and Chicago.

CLEOPATRA'S NEEDLE.

An accurate photograph of this ancient wonder, TAKEN ON THE SPOT (Alexandria), showing distinctly the hieroglyphics covering its surface. Will be sent, post-paid, on receipt of 25 cents, by E. H. HILL, 362 Broadway, Brooklyn, E. D.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 28, 1878.

The Week.

THE observance of Washington's birthday so shortened the Congressional week that there is little to report from the Capitol. On Wednesday, the 20th of February, the Senate passed a bill to regulate the compensation of postmasters, and, on the motion of Mr. Hamlin, amended it into a bill to increase the perquisites of Congressmen, by restoring to them the franking privilege. This was not quite a unanimous proceeding, but mustered 32 votes in its favor out of a total of 53. On Thursday, in the House, Mr. Stephens, of Georgia, called up the Senate Silver Bill, and moved to concur in its amendments. The original bill, it will be remembered, was passed in the House without debate, under the previous question—a thing which, under the circumstances, could not have happened in any other parliamentary body in the civilized world. The amended measure was allowed to be debated in five-minute speeches precisely one hour, and a motion to lay it on the table (made by Mr. Hewitt, of New York) received only 72 votes, while 204 were recorded against it. The amendments were then concurred in seriatim, and both houses adjourned with a good conscience to meditate on the virtues of the Father of his Country.

The Cincinnati *Commercial*, now that the mischief for which it has been laboring for the past six months has been accomplished, is trying to get its dupes to become suddenly sensible and carry the silver craze no further. It warns them—which will greatly surprise them—that they "must not expect an instantaneous revival of business and abounding prosperity"; but why not? If even half what the *Commercial* has been telling them since October last be true, they have every right to expect them, and to commit acts of violence on somebody if they do not get them. "The country," it coolly adds, "needs repose on all sorts of dollar questions, and presently the people will be very impatient with the agitators." They will; but they will not make the distinction between agitators which the *Commercial* seems to look for. We have shown elsewhere that all the arguments the *Commercial* and its confederates have been using in favor of the dollar of 412½ grains will justify the people, if they do not get "abounding prosperity" through it, to try a cheaper dollar still, and to agitate for it till they get it; and more than this, if cheap silver does not bring prosperity, to try cheaper money of some other kind, and, in fact, resort to any legal means to despoil persons who possess accumulated property, and lend or invest it in production. The *Commercial* has done its best to rouse the most hateful and anti-social passions in aid of gross economic delusions, and everybody who has watched its performances and those of its Chicago colleague must regret that the Ohio law which makes the liquor-dealer responsible for the damage done by the drunkard who has bought of him, cannot in some manner be made applicable to their case.

The first meeting of the "National" Party was held at Toledo last Friday, and a platform was adopted on which the new organization proposes to run a ticket in 1880. Twenty-eight States are said to have been represented, and these mostly by gentlemen with whose names the public at large is not familiar; the Convention was presided over by Judge Francis W. Hughes, of Pennsylvania, a magistrate unknown to us. The platform adopted declares that the wide-spread financial distress and suffering and crime now prevailing throughout the country are due to "legislation in the interest of and dictated by money-lenders, bankers, and bondholders"; points out that the existing party organizations afford no relief; and announces the formation of the new "National" party to secure "financial reform and industrial emancipation." It goes on to insist that "all bank issues designed to circulate as money should be suppressed," and all money be issued by the Government; that there should be no privileged class of creditors, but that all obligations of every kind, public or private, should be discharged in lawful money; that the coinage of silver ought to be placed on the same footing with gold; that Congress should provide an amount of money "adequate to the full employment of labor, the equitable distribution of its products, and the requirements of business," fixing a minimum *per capita* of the population and "otherwise regulating its value by wise and equitable provisions of law, so that the rate of interest will secure to labor its just reward." Further, it demands the taxation of Government bonds and money, and the imposition of a "graduated income-tax"; declares that Government should encourage industry of all kinds, "to the end that labor may be fully and profitably employed"; that no monopolies should be legalized; that useless offices should be abolished, rigid economy practised, and breach of public trust severely punished; that the "hours of daily toil" should be reduced, and bureaus of labor and industrial statistics established by the State and National Governments; that the prison-contract labor system ought to be abolished, and the "importation of servile labor" from China be suppressed. The new party not only demands all this, but predicts, if its demands are agreed to, a blissful future for the country, in which the producer will enjoy the products of his labor and skill, and the "vast army of idlers who, under the existing system grow rich upon the earnings of others," will disappear from the face of the earth.

It is curious to observe the connection between the declarations of this new party and those of the Indiana Democrats, who also had their convention last week. The latter want the National Bank notes retired and Treasury notes issued instead; are in favor of making greenbacks a full legal tender for everything, except where the original contract made them expressly payable in coin; insist that money ought to be issued in such amounts "as the sound business interests of the country may from time to time require"; that Treasury notes ought to be taxed by the States; that further legislation for the funding of the national debt abroad is unwise; that what ought to be done is "to distribute said debt among our people at home"; that six per cent. should be the legal rate of interest; that the silver dollar of 412½ grains (unlimited) ought to be restored, the Resumption Act repealed, rigid economy instituted and fees and salaries reduced, the bankrupt law repealed; that wages of employees should be a first lien upon the earnings of corporations; that laws should be passed for the ventilation of coal-mines; and that the jurisdiction of the Circuit Courts of the United States ought to be limited and restricted. The Indiana Democrats are also opposed to "class legislation," and they protest against subsidies of any sort. They refer to the Presidential "fraud" in scathing terms, denounce the President for giving offices to members of returning boards, and condemn "the acts of Federal officers in attempting to interfere with the rights and powers of the State Courts in the prosecution of these criminals." They further call for pensions for the soldiers of the Mexican war. There is not, it will be seen, a great deal of difference between the aspirations of the Indiana Democrats and those of the "National" Party. On financial questions they are nearly at one, and even on pensions a compromise could probably be effected. The Indiana Convention was noticeable for a financial speech by Mr. Hendricks, who presided over the deliberations. He came out as bold as a lion for a "non-interest-bearing currency, based upon the credit of the country."

Anderson's application for a new trial in New Orleans has been refused, and he has been sentenced to two years' imprisonment with

hard labor, but the execution is suspended to allow of an appeal. Wells has filed an extraordinary affidavit in support of an application for the removal of his case to the United States Court, averring that his prosecution is the result of a "conspiracy," and that the "conspiracy" will prevent his having a fair trial in the State courts. He wrote an extraordinary and amusing letter to the New York *Times* a week ago, bringing divers charges against everybody connected with the prosecution in Anderson's case. The judge, he says, was in a state of "beastly intoxication" during the whole trial, and the State counsel had committed murder and other offences. The excitement about the pair has quieted down in Washington, where it is becoming clearer that what the country demands is that they shall somehow retire into obscurity. Governor Nicholls would do well to pardon them if they would agree to go out of office. Nothing appears in the reports to warrant the assertion that Anderson's trial was not fair and decorous.

They have got a "Committee on Frauds" at work in the South Carolina Assembly, which is unearthing the rascalities of the Ring in that State at a rapid rate. The Committee profess to be much astonished at the facts discovered, though why there should be any surprise at such matters we are at a loss to understand. The frauds seem to have been perpetrated, as usual, under the guise of "supplies." In the language of Senator C. P. Leslie, it was felt that "the State had no right to be a State unless she could pay and take care of her statesmen." The student of history will be interested to know that one form of fraud was the issue of "gratification" certificates. At one session there was spent for "sundries," "supplies," and "incidental expenses" $350,000, of which $125,000 went for "refreshments." The frauds, strange to say, do not appear to have been confined, as we had been led to expect, to any particular party, but were practised by "Cavalier," "Puritan," and the simple-minded African indiscriminately. It appears from the testimony that the bar-room of the State-House was, during the carpet-bag régime, the only bureau of government that was kept in efficient operation, the "hours" being from 8 A.M. till 2 or 4 next morning, and besides this large quantities of wines, liquors, and cigars were sent to members of the Legislature at their homes. The prices paid for these supplies were in most cases high and the amount consumed large, the evidence tending to show that every member of the House and Senate drank a gallon per day, with a few extra bottles of ale and wine thrown in, and smoked not less than one dozen cigars in the same time. There is at present only $17,715 worth of furniture in the State-House, although within four years over $200,000 was expended on that account; a state of affairs accounted for by the fact that most of the furniture was put into the "private residences of the statesmen who ordered it, instead of into the State-House." The "furniture" account, too, was a somewhat elastic one, as under it we find bills for mules, horses, buggies, carriage-hire, and horse-feed. Musical instruments seem to have been purchased by the State also, of one Jones, the melodeon being the favorite instrument, and carpeting, to an enormous extent, put down; the practice being to furnish all the committee-rooms at every session with carpets which were, toward spring, carried home by the committee-men, unless, as sometimes happened, they were "shipped to Massachusetts." Some members displayed a great deal of opposition to the bills, and insisted on receiving a percentage if they were to be paid by the State, and all disputes over the amounts of the bills seem to have been settled amicably in this way. There is a vast amount of evidence of this sort, all of the most unquestionable character; and the committee wind up their report with a roll of rascals, thirty or forty in all, who habitually shared in the spoils. Among them are Lieutenant-Governors Ransier and Gleaves; Robert Smalls, the member of Congress; Whittemore, the cadet-broker, and F. J. Moses. In the language of Governor Chamberlain, the spoils seem to have "footed up pretty well."

Governor Robinson's message to the Senate, on Thursday, accompanied by specific charges of official misconduct on the part of Mr. John F. Smyth, Superintendent of the Insurance Department, is creating considerable anxiety among the holders of life-insurance policies, and justly so, as to a certain extent the whole system of State supervision is placed on trial in the person of Mr. Smyth. The charges are made by the Comptroller and relate to violations by the Superintendent of the Act of 1873 in regard to payments for the examination of insurance companies, which provides that all bills for such examinations shall first be certified by the Superintendent, audited by the Comptroller, and paid out of the Treasury, the sums so paid to be subsequently collected from the companies examined. The Comptroller charges that bills amounting to more than $55,000 have been paid by the companies without his audit. His statement is very complete, giving the items paid, from information furnished by the companies themselves at his request. The Act of 1873 was drafted by Superintendent Chapman, whose integrity has never been questioned, and was designed to prevent just what has now occurred. Almost the first thing Mr. Smyth did, after entering upon the duties of his office a year ago, was to procure the passage of an act repealing the very wholesome provisions of 1873. Governor Robinson refused to sign the bill, and the Legislature having adjourned when his veto was given, the Superintendent, fortified by the advice of one of the legal firms which had a large share of the substantial results of their advice, proceeded with his expensive examinations, collected his bills from the companies (modifying them in some instances where they demurred), and ignored and defied the Comptroller. The bills which the Superintendent has seen fit to present to the Comptroller for his audit amount to less than $10,000, and cover the personal expenses of the Superintendent, his deputy, and a considerable number of clerks and examiners during about one year, while examining perhaps twenty companies. As far as appears, no complaint is made of the sums so paid. The objectionable bills, which the Comptroller had no opportunity of passing upon, and which in the case of one company exceeded $32,000, cover the cost of appraising the value of real estate owned by or mortgaged to the companies and of examining the titles to the same.

The simple theory of State supervision is sound enough in itself, but its practice has been so encumbered with abuses that we may well question whether the public would not be better protected without than with it. The system has now been in operation in this State for eighteen years. For more than half that period it was administered with undoubted integrity, with dogmatic precision, and with mediocre ability. Then followed the Miller régime, which began by summarily closing two rotten concerns, and would probably have closed others had not the arguments to the contrary been too substantial to resist. Then came the full term of Superintendent Chapman, against whom nothing more serious than indolence could be charged; then an interval of a year in which Deputy McCall was the active though not "acting" superintendent, and he has the reputation of being thoroughly competent to fulfil the duties of his office. Now for a year we have had Mr. Smyth, who, taken from the postmastership at Albany for political reasons best known to Mr. Conkling, without a pretence of his special fitness for the duties of his office, will have an opportunity of explaining to the Senate why it was necessary to put into the hands of his political associates the examinations of so many titles which had already been passed, it must be presumed, by competent lawyers, and why the bills of expenses so incurred were not referred to the Comptroller for his audit. We trust that he can satisfactorily answer the charges brought against him; if he cannot, policy-holders will feel that State supervision, instead of being the protecting ægis that it purports to be, is in reality a screen behind which all sorts of rascalities are carried on to their detriment, and they will exclaim in desperation, *Quis custodiet ipsos custodes?*

The feature of the week in financial circles was the return of United States bonds from Europe. The amount sent back since the amended Bland Bill received the approval of both branches of Congress is estimated by bankers in the business to be not less than $10,000,000, and they calculate that bonds will continue to come at the rate of $6,000,000 per week, even if there is no panic among foreign holders. Prices in London fell during the week 1 to 1¼ per cent., while here the fall was only ¼ to ⅜. As there was no advance in gold, it resulted that during the whole week there was a handsome profit in importing bonds. The New York buying was partly for speculative account and partly for real holders, who reason that whatever taints the paper of the Government affects alike that which bears interest and that which does not, and therefore it is better to hold that which pays interest than that which does not, and that in due time the return of bonds will advance the price of gold, and then the currency prices of bonds will advance. This reasoning may be specious, but it governs many. At the close of the week there was a fractional recovery in prices on the strength of reports that the Senate would probably sustain the President's veto. As the result of bond importations, bills on London were in such demand through the week that drawers advanced their rates from 4.82¼ to 4.83¼ for 60 days, and from 4.84¼ to 4.85¼ for demand drafts. The working of the markets has demonstrated that they were at first manipulated so as to convey the impression that the Bland Bill was harmless to the public credit. The London *Times* also says that the advance in silver to 55¼*d.* per ounce was caused by speculative buying, first shown in bidding up India Council bills at the last weekly sale. The New York silver market did not keep pace with London, and at the close of the week the gold value of a 412½-grain silver dollar would have been only $0.9242. The gold value of a "paper dollar" at the close of the week was $0.9815.

Every time the Russian demands on Turkey are revealed they seem to have risen in amount, and the wonder is not that the Turks should hesitate to sign the treaty, as they are said to do, but that they think it worth while to sign a treaty at all. The latest version of the terms makes the new principality of Bulgaria include not only the region north of the Balkans, but nearly the whole of Rumelia east of the Maritza, leaving only a narrow strip of territory on the Black Sea directly subject to the Sultan. It is to pay a tribute equal to the present "net revenue" of the province—an ambiguous phrase, because it may either mean all that the Porte now carries away from the province, which is a good round sum, or all that it ought to carry away after having provided a good administration, which would be a very small sum. This latter is probably the interpretation which Russia will adopt. The prince is to be chosen by an assembly of notables and approved by the Porte and the Powers, which of course means by the Powers. Montenegro is to get Podgoritza and Antivari, and doubtless also Niksitch. How much increase of territory Servia is to get does not already appear, but the plan of giving the Dobrudja to Rumania in exchange for the piece of Bessarabia which was taken from Russia in the last war, is adhered to. Turkey is to surrender Batum, Kars, Bayazid, Ardahan, and the adjoining territory, by way of war indemnity, and also to give $200,000,000 in bonds, the interest of which is to be secured by the Bulgarian and Egyptian tributes, and the Anatolian revenue. Besides all this, it would appear that the greater part of the ironclad fleet is to be surrendered.

These tremendous exactions, as a fair result of overwhelming defeat, the Conference will probably have to agree to with but small, if any, modification; but the proposal to occupy Bulgaria with 50,000 Russians for two years, and to supervise the reforms by a Russian commission, is hardly likely to be carried out without energetic opposition from Austria, which will probably also have her say about the annexations to Servia and Montenegro. The Ministry has decided to follow the example of England and ask for a credit of 60,000,000 florins to support the Government at the Conference. But no matter what either England or Austria may say or do, the treaty necessarily amounts to the extinction of the Turkish Power in Europe. The Sultan may cling to Constantinople a few years longer, but the difficulties and humiliation of staying there will increase steadily and make his early retirement to Brusa a necessary condition of his retention of the Asiatic portion of the empire with any prestige. The peace party in England seems to be for the moment overthrown, and the Ministry might have its fill of war, if it had any army, or if the Russians had none. The military operations are thus far confined to keeping Gallipoli under strict guard with the fleet, and singing patriotic songs in the London music-halls. The want of an army bids fair to make the demonstrations against Russia fruitless, even if the Ministry were a united and determined body and had any policy.

Much of the war fever in England, which in some of its manifestations has an unpleasant resemblance to the war fever in Paris before the German invasion, is due to the ignorance or forgetfulness of the British public of the change which has occurred in the conditions of warfare since England last took part in Continental conflicts. In the days of Wellington, the 30,000 or 40,000 men which is all that she can send into the field, and which can be conveniently carried out in a fleet, were a very respectable force, which could maintain itself finely wherever it was put ashore. Wellington had only about this number of British troops at Talavera and Waterloo, and England had an immense advantage in being able to supply her forces by sea when her enemies had to drag everything by horse over ordinary roads. Moreover, all wars were then necessarily long, owing to the inability of the belligerents to bring their resources rapidly into play, and the tediousness of the operations gave the staying power of wealth a great importance. This is now all changed. Continental powers put every man they have in the field in the first campaign, or forward them by train in masses, to which the traditional British "expeditionary force" of 30,000 is but a single mouthful. The fact is, therefore, that to give any real formidableness to the breaking of Gladstone's windows and the singing of "We Don't Want to Fight" the conscription is absolutely necessary, and there is no doubt that this would make the patriots of the London music-halls as unwarlike as Quakers, and utterly indifferent to the sufferings of "the weaker party."

As was generally expected, the new Pope is an Italian, Cardinal Pecci, the late Pope's Chamberlain, having been elected on the second ballot. He is a moderate, and will not make things any worse; whether he will improve the relations of the Papacy with the Italian Government remains to be seen. Cardinal Simeoni issued a protest, which Pio Nono is said to have dictated, against the assumption of the title of King of Italy by Humbert, recalling all the previous protests of a similar character, and reciting the various ills and griefs which have overtaken the Pope in consequence of the loss of his estates. The new Pope, who styles himself Leo XIII., was, it was at first reported, ready to give up the prison theory, and leave the Vatican to drive and get change of air; but this, again, has within a few days been denied. If he does so, it will be a virtual admission that he is not impeded in the discharge of his spiritual functions, and thus a virtual abandonment of the doctrine that the temporal power is necessary to the Pope's freedom. The foreign cardinals, and particularly the Englishmen, were, if report speaks truly, desirous of having the Conclave held on foreign soil—at Malta, for instance—by way of proving that there could not be a free election at Rome; but the Italians, who compose 26 out of the 62 existing members of the college, were too knowing to agree to anything of the kind. The Cardinal Archbishop of Malines has written to the *Catholic Review* of this city a solemn denial of the story that Belgian priests had been exhibiting to the faithful wisps of the straw on which Pius IX. slept in his dungeon.

THE FIRST STEP TOWARDS REPUDIATION.

WE publish this week an interesting letter explaining the process by which the repudiation of town and county debts is planned and carried out in certain portions of the West. What is most worthy of attention in it is, that it is generally begun by an effort to work on the fears of the creditor in such a manner that he shall himself consent to surrender a portion of his claim in advance of any action on the part of the debtor. This consent is procured by representing the people of the indebted community as an excitable animal, without moral responsibility or any regard for the future, and as bent on any course, however violent, that may be necessary to get rid of its obligations. The person who opens the negotiations with the creditor is sometimes the ordinary demagogue, in or out of Congress; and sometimes, as in the case described by our correspondent, a lawyer acts as a sort of go-between, and professes to have the interest of the creditor truly at heart, and to share his view of the morality of the affair—that is, he acknowledges in the fullest manner the legal and moral right of the creditor to get the full amount promised him, and he does not deny the ability of the debtor to pay it. Having thus secured his position as a moralist, he suddenly assumes the rôle of a practical man dealing with a wicked world as he finds it, and not as he would wish to have it. Nobody can deplore more than he does the determination of the people of Bosh-posh County not to pay their debts; he sees no excuse for it; he knows they got the money, and are enjoying the benefit of it, but the question is not how they *ought* to feel about it, but how they *do* feel. He has the best reasons for knowing that they are at this moment on this subject indifferent to all moral and religious considerations, and have decided, with deplorable unanimity and determination, to pay at most only a part of what they owe. By delicate handling and prompt expression of readiness to accept it this part may now be secured; any hesitation about accepting it, however, will probably increase their irritation, and cause them to refuse payment of anything whatever. All through the exposition the agent deals with the popular feeling as a law of nature which may seem cruel or unjust or capricious, but which there is no gainsaying or resisting. He argues with the creditor, in short, as one would argue with the owner of a pleasant home at the foot of a volcanic mountain, in order to induce him to pack up his goods and get out of the way of an eruption.

The creditor who allows himself to be frightened into an offer to compromise, however, too frequently finds that not only are "the people" no readier to pay part than to pay the whole, but the very offer to receive part suggests the idea of paying nothing at all. If the compromise were the result of an examination of the debtor's means, and what he proposed to pay and the creditor agreed to accept was what proved to be all he was likely to be able to pay when acting with honest intentions, of course there would be no danger in making it. The moral and legal guarantees which supported the original loan would support the "readjustment." But when it is simply the result of the debtor's unwillingness to inconvenience himself or to part with money in his possession, and has no sort of reference to his pecuniary resources, the reasons for paying only part will support in the fullest manner total repudiation. "The people," in fact, on learning that the creditors will submit to a reduction of ten or twenty or forty per cent., very naturally say: "Our argument, simple as it was, has evidently made a deep impression on these men. He acknowledges that he has no rights in the matter, except such as we please to allow him, and that if we allow him sixty per cent. of his original claim it will not be an unfair settlement. In other words, he refers the whole matter to our discretion. This being the case, and the question having become one of comparative inconvenience—whether, in short, it is better for several hundred thousand persons, mostly poor, to submit to a tax, or for a few hundreds, who are mostly well off, wholly to forego expectations which they themselves acknowledge were in great part unreasonable—we have no hesitation in deciding that the interests of this community will be best promoted by letting them lie out of their money altogether. The fact is, they ought never to have lent it; they must have foreseen that there would be difficulty about getting it back. They bought the bonds as a speculation, and they are no worse off than other speculators who went into railroads and other stock companies that have failed. They will be wiser next time."

Accordingly, when the bondholder steps up to draw his sixty per cent. of his claim, he is apt to find, as in Tennessee, that the propriety of giving him even fifty per cent. has begun to seem doubtful, and that in any case he will only receive half or two-thirds interest on what is allowed him, and he has the further mortification of finding that the arguments which induced him to surrender his coat have proved sufficient to warrant his being stripped to the skin.

This view of the irrationality and irresponsibility of the people has been as fully avowed in the silver movement as in any of the minor schemes of municipal repudiation, but with this difference: that the leaders of the silver movement never profess, like the town or county attorney, to separate themselves morally from the debtor. They never pretend to be of the same mind as the creditor as to the abstract justice of the proposed attack on him. Being politicians, they usually profess entire sympathy of all kinds with the popular reluctance to pay, and utter the usual threat of total spoliation, not as something wicked yet inevitable, but as something both justifiable and inevitable. They have the advantage, too, over the town and county repudiators, of having a bigger and more ferocious People behind them, and one far more difficult to control if once enraged. The town or county agent is never able at most to predict anything more dreadful than a total repudiation of public and private debts, while the silver demagogue goes so far as to predict bloodshed, anarchy, and indeed a practical dissolution of the social bond as the probable consequence of a refusal to let him circulate a 412½-grain dollar as a full legal tender.

What we wish to point out here is the extreme improbability that he will be content with the victory he has just won. He has secured at this writing the passage of the Silver Bill, but, be it well remembered, he has not secured it in the character of a bi-metallist, but of a repudiating debtor. That the ranks of the silver-men contain a considerable body of honest but, as we conceive, mistaken bi-metallists we do not deny, but these men have played no prominent part in the agitation. They have been carried along by it, and have now and then made efforts to divert its course, some of which have produced good results, such as the changes made in the Bland bill in the Senate. But the preponderating influence in it, the one which has given it all its life, has been the repudiating influence. The silver dollar has had little or no attraction for the bulk of the silver-men, either as a means of enlarging the coin basis of paper circulation or as providing a more extended market for a leading product of American mines, as was shown by their steady opposition in Congress to any dollar except one of 412½ grains; and their attachment to this has been due to the fact that it is worth ten per cent. less than gold; that is, if at 412½ grains it was at par with gold, it would have no attractions for them.

The arguments and rhetorical devices by which the measure has been supported in the West are almost wholly those of repudiating debtors, and have been directed, and with the usual fierceness and bitterness, against the gold-men, not as mono-metallists but as creditors or representatives of the creditor interest. Bland's threat, that if the bill were not carried Congress would next year "wipe out" the national debt, was a sort of agglomeration of the minor threats of the Western press, and would of course have been ridiculous if the movement were simply that of a particular school of financiers in favor of a particular metallic standard, because the national creditors could not be held responsible for the mono-metallists as scientific men any more than for the evolutionists. In fact it has been all along, and from the very beginning, treated by the Western press as a measure of relief for debtors against extortionate creditors. Within a few weeks one of the most conservative and sensible of the Western papers, the Indianapolis *Journal*, put the

case with a frankness that had something humorous about it, when it suggested that if Eastern men did not like the remonetization of silver, they should offer something in its place—such as a reduction of the rate of interest on loans made at the West. It then proceeded to inveigh against the rate now paid in a manner which showed clearly that both it and its constituents either did not consider, or affected not to consider, the rate of interest as in any degree dependent on the quality of the security, but simply on the creditor's greed and the debtor's necessity.

We may add that we have ourselves received numerous remonstrances from correspondents at the West, who agreed with our view of the silver question, warning us of the error of denouncing the remonetization scheme on moral grounds, and urging us to confine ourselves to showing its unprofitableness, as by far the most effective argument. We have declined to follow this advice, however, for the simple reason that we do not think the unprofitableness of cheating can ever be made entirely clear to a man bent on cheating or in a cheating state of mind, because if, as in this case, attended with no risk of legal penalty, its profitableness within that short space of time for which his calculations are always made is undeniable. The unprofitabless of cheating a creditor who has no legal remedy is unprofitableness in the long run, and about "the long run" a cheat, as a general rule, cares nothing. Moreover, for a journalist to confess either tacitly or in terms that he is addressing a political community with which moral considerations have little or no weight, is, in a certain sense, to cut the ground from under his own feet, because the whole business of discussion in civilized political communities rests on the assumption that there is behind the political machinery and political sovereignty a moral rule from which they, in great part, draw their efficacy and their authority. A community which lived wholly by its own passing inclinations would have no need of newspapers, any more than a band of brigands or a tribe of Bushmen. What we have now to bear in mind, therefore, is that the arguments—which must be distinguished carefully from their false statements and prophecies—by which the silver-men have triumphed will be just as strong, in case the present measure does not give them the relief they look for, in favor of a 400, or 350, or 300-grain dollar, as in favor of one of 412½ grains, and in favor of reducing the value of the legal-tender dollar indefinitely until the point is reached at which everybody will be able, without sacrifice or inconvenience, to procure as many dollars as will be sufficient to pay his debts. There is no magic in 412½ grains any more than in 420. The thing sought is a dollar of such weight and fineness that debtors will have no difficulty in getting hold of them, as those who have gone into this movement with the foolish fancy that they were helping the cause of a stable standard may possibly yet discover to their cost, when they learn that the "Money Power" is as potent with the present silver standard as with the old gold one.

THE CANADIAN FISHERIES AWARD.

THE Commission on the Fisheries, created by the Treaty of Washington, met at Halifax on the 15th of last June, four years after the time originally intended. The Commission was composed of its president, M. Maurice Del Fosse, then Belgian Minister at Washington, named by the Austrian Minister at London; Sir Alexander T. Galt, named by Her Britannic Majesty; and Mr. Ensign H. Kellogg, of Massachusetts, by the President of the United States, in place of Mr. John H. Clifford, of Massachusetts, the original appointee, who had died. Mr. Francis Clare Ford, of the Foreign Office, London, formerly Secretary of Legation at Washington, attended the Conference as the agent of Great Britain, and Mr. Dwight Foster, of Boston, as the agent of the United States. Great Britain was also represented by five counsel, one from each of the maritime provinces of British North America, and the United States by Mr. Richard H. Dana, jr., of Boston, and Mr. William H. Trescot, of South Carolina. Final arguments were made by Judge Foster, Mr. Dana, and Mr. Trescot on behalf of the United States, and on behalf of Great Britain by Mr. Whiteway of Newfoundland, M. Doutre of Montreal, and Mr. Thomson of New Brunswick. On the 23d of November, at the seventy-eighth session of the Conference, an award was made by two of the Commissioners, Mr. Kellogg dissenting, of five millions five hundred thousand dollars in gold to be paid by the United States.

Article I. of the Treaty of 1818, which the United States admitted to have been revived by the abrogation of the Reciprocity Treaty in 1866, gave to the inhabitants of the United States liberty to take fish of every kind on the southern coast of Newfoundland, from Cape Ray to the Ramea Islands, and on the western and northern coasts from Cape Ray to Quirpon Island, on the shores of the Magdalen Islands, and on the south shore of Labrador from Mt. Joly easterly and northerly indefinitely, with the right to dry and cure fish in any of the unsettled bays, harbors, and creeks of those parts of the coast of Newfoundland and Labrador. And the United States renounced for ever any liberty to "take, dry, or cure fish on or within three marine miles of any of the coasts, bays, creeks, or harbors of His Britannic Majesty's dominions in America not included within the above-mentioned limits." The Treaty of Washington gave the inhabitants of the United States the right to take fish of every kind, except shell-fish, on all parts of the coast of British North America; gave the same right to British subjects in the waters of the United States north of the 39th parallel of north latitude, it being expressed, however, that this did not apply to fisheries in rivers and mouths of rivers, but only to the sea-fishery; and gave reciprocity in trade between British North America and the United States in fish and fish-oil, being the produce of the fisheries of the United States or of the Dominion of Canada or of Newfoundland.

The question which the Commissioners were empowered by the treaty to decide was briefly this: What, if anything, is the money value to the inhabitants of the United States of the right gained by the Treaty of Washington of free fishing in British-American waters beyond what was enjoyed by the Treaty of 1818, for a period of twelve years certain, over and above the value to British subjects of the right of free fishing in the waters of the United States north of the 39th parallel of north latitude, and the certainty of no duty whatever being imposed on fish and fish-oil for the same period of time? The Commissioners were not authorized to consider any benefit to the inhabitants of the United States from reciprocity. The value of the privilege, on both sides, to land for the purpose of drying nets and curing fish was also to be considered; but the evidence tended to show that this is of little or no practical value now. Nor did the evidence show that the British subjects used, or are likely to use, to any considerable extent the right to fish in the waters of the United States.

When the British evidence was nearly all in, the Commission were asked to rule, and, after full argument, did rule unanimously, that it was not competent for it to award any compensation for commercial intercourse between the two countries, and that the advantages resulting from the practice of purchasing bait, ice, supplies, etc., etc., and from being allowed to tranship cargoes in British waters, could not be considered, on the ground that an award which should include these claims would be *ultra vires*. This was admitted to be a severe blow to the claim of Great Britain, and seemed practically to exclude that of Newfoundland. An effort was afterwards made to show that American fishermen caught bait inshore at Newfoundland, but it had been previously testified by British witnesses that the universal practice, aside from occasionally "jigging" a few squid, was to buy bait, and that Americans who tried to catch for themselves would probably receive rough treatment. In the light of recent events, it seems that these witnesses were not mistaken.

The headland question—*i. e.*, whether, under the Treaty of 1818, the United States had a right to fish within three miles of the shore of the large bays whose headlands were more than six miles apart, as the bays of Fundy, Miramichi, and Chaleurs, or whether they were excluded from fishing within three miles of a line connecting their headlands—which at one time seemed likely to be prominent

in the case, was only incidentally raised, and it was evident that neither side cared to have it passed on.

The evidence tended very strongly to show that cod and halibut are almost exclusively a deep-sea fish, and all of the counsel of the United States, in the closing arguments, treated them as practically out of the case. There was some evidence of inshore halibut-fishing at Cape Sable and in the Gulf of St. Lawrence, but it was very slight and contradicted by other witnesses. It was alleged that herring were caught by United States fishermen in very large quantities at Grand Manan and elsewhere; but the evidence was very general and was contradicted. It was shown by witnesses on behalf of the United States that American vessels were too expensively fitted out for it to be profitable to catch so cheap a fish as herring, and that it was much more profitable to buy them.

The real fight was over mackerel, and if the amount of the award can be justified at all, it must be on this part of the case mainly. The evidence was contradictory in the extreme as to the proportion of mackerel caught within the three-mile line, but it probably is not more than one-third, and certainly not more than one-half. There was a conflict, too, whether the Magdalen Islands, where Americans have always had the right to fish, were the best and safest grounds. It was contended strongly on the one side that a profitable voyage could not be made without the right to fish inshore, and equally strongly on the other that the best captains did their fishing at the Magdalen Islands and offshore, and that the best voyages were the result of such action. Before the treaty, when licenses to fish inshore were granted, it was shown that at fifty cents a ton most of the United States vessels took licenses, but at two dollars a ton scarcely any. On the other hand, there was evidence that they declined to take them because they thought it cheaper to run the risk of being seized. There was a very large amount of evidence of the catches and profits of single voyages, which was interpreted very differently by the different sides.

It was shown that Great Britain and the Colonies were at an immense expense in guarding the three-mile line, which is saved under the treaty. As one ground for desiring the restriction removed, it appeared that there was a very burdensome statute of Nova Scotia under which a vessel in harbor for the purpose of buying bait had been held "preparing to fish," so as to be liable to seizure.

On the counter-claim of the United States Great Britain introduced much evidence, and argued that the imposition of duties was no injury to them on the ground that the "consumer paid the duties." In reply it was shown that the United States afford almost the only market of the Provincial fishermen; that the duties previously imposed were nearly prohibitory, as the price of salt fish can only be forced up to a limited point, and that large numbers of British subjects who had been fishing in American vessels, to save the duties, had returned home and were rapidly increasing the fishing business there. Some claims were made by Great Britain which it can hardly be supposed that the Commissioners took into account, such as the claim for injury to the fishing caused by the alleged habit of Americans of throwing "gurry" or offal overboard, for the expense of maintaining the light-house and fog-horn service, and for the fact that the fishing business gives employment to a large number of men in the United States in handling the fish after their arrival. In reply to this last point, the great richness of the sea and lake fisheries of the United States was shown, and that from improved methods of preservation and transportation fresh fish were rapidly displacing salt in the market.

It is impossible to doubt, after an examination of the evidence and statistics, that the amount of the award cannot be justified, if, indeed, any should have been given. If we examine the Port Mulgrave returns, put in by the British Government, which were admitted by both sides to be not far out of the way, of the United States vessels with their cargoes which passed through the Gut of Canso in 1873 and 1874 (they refused to put them in for the two years following), we find that half a million dollars a year will much more than pay for all the mackerel caught in the Gulf of St. Lawrence by United States fishermen, inshore as well as offshore, at the price paid by dealers at Prince Edward Island. It would probably more than three times pay for all the mackerel caught by them on the grounds gained by the treaty of Washington. Cod and halibut are scarcely caught at all inshore; all the fishermen go to the banks for them. Herring and other small fish used as bait are generally bought, as both time and money would be lost in fishing for them. Even if we take the market price of the fish caught as the money value of the privilege of fishing, we find it hard to find more than the amount of the award, without any consideration of the gain from the remission of duties. But the United States returns show that remission of duties on fish and fish-oil, under the treaty, for three years averaged over $360,000 a year. Is it possible that the producer gains no benefit from this remission? Does political economy teach that in the case of an article of food which is used mainly because it is cheap, for which there is but a limited demand, and which will be deserted for other kinds of food if the price is raised beyond a limited point, the consumer must pay the whole duty?

Mr. Kellogg, in dissenting, stated that it was questionable whether it was competent for the Commission to make any but a unanimous award. The treaty provided that "any sum of money which the Commissioners should award should be paid by the United States within twelve months after the award." The similar provision in the case of the Geneva Commission in the same treaty was that an award by a majority should be binding; and it has been a matter of some discussion whether the treaty did not intend, by its different phraseology, that there should be a difference in this respect. The award is believed, by those who were present on behalf of the United States at least, to be grossly large, and the temptation is strong to try to avoid it by any technicality. But there was a long hearing on the case, as fair a trial probably as can ever be had, both sides expressed themselves fully satisfied that the full strength of their case had been brought out, and it seems unworthy of the dignity of the country to try to take advantage of a doubtful point of law. Aside from any legal view, it seems hardly probable that the framers of the treaty intended to allow the Commissioner of the United States, without giving any reason, and possibly without having any, to prevent any award being made. The President of the Commission was agreed upon by the two countries, and was undoubtedly impartial in his intentions, but wholly unused to examining and balancing evidence. If the British Commissioner, a man of great natural ability and thoroughly master of the case, was more able to get the ascendency over him and influence him by arguments than our own Commissioner, it is our fault in not being more worthily represented. The Geneva award was made by a majority and paid, and the same should be done with the Halifax award. We are now struggling against a party who are desirous of partial repudiation, and it is a fact worthy of note that the only member of Congress who has declared himself opposed to the payment of the award is also the only member from New England who advocates the silver bill. It will be a lasting disgrace to the country and a blow to the future settlement of disputes by arbitration, if the counsels of Gen. Butler prevail and the debt is not paid.

COMMUNISM AND PROTECTION AT THE CAPITAL.

WASHINGTON, February 25, 1878.

ONE of the strongest arguments advanced for the passage of the Silver Bill, although not made prominent in public debate, was that, if not passed, "the people" would insist on fresh issues of irredeemable paper; and now that it is passed and is awaiting the President's signature, we are adjured to look at the convention of bedlamites at Toledo, and to prepare ourselves for a tidal-wave of communism and greenback inflation if we do not allow "the people" to have 90-cent dollars. Mr. Bland himself, in the last day's debate, talked about cramming greenbacks down the throats of the bondholders if he could not have the Silver Bill, free coinage and all. The proper answer to the Toledo communists, and to Mr. Bland, and to the Louisville *Courier-Journal*, which has been making itself particularly foolish in this business, is that this is as good a time as we shall ever

have to "untie the winds and let them fight against the churches." Silver bills, with or without free coinage, are not going to pay mortgages or get people out of debt. The foes of communism must meet the Toledo rabble at some time. They have got to fight Mr. Bland as a crammer of greenbacks down people's throats, anyhow. They must defend the rights of property and the present system of society and government sooner or later, and defend them with whatever weapons their assailants arm themselves withal. And when the threat is made : "If you don't take silver, we will give you pewter or paper, and cram it down your throats," then is the very time to make whatever resistance is to be made to any project these gentry have in hand.

It is a singular fact that the silver extremists in the House did not understand the effect of striking out the free-coinage clause until the bill came back to them in that shape. The action of the Senate Finance Committee in this behalf was taken last November, and it was at once perceived that only in that shape could the bill ever become a law. It was perceived by business men that, under the operation of the bill as amended, two or three years must elapse before enough silver could be coined to make its presence felt in general circulation, although it might come into play somewhat earlier at the custom-houses and the subtreasury, serving to reduce the tariff and diminish the receipts of the "coupon-clippers." All this seems to have been apparent everywhere except among the framers and ardent supporters of the bill in the House. When it came back to them they were half-crazed to find one of their cubs missing. Hasty conferences were held and resolutions passed to reject the Senate amendments; to reject the whole bill and commence anew; to refer the bill and amendments to this committee or that committee or the Committee of the Whole. The fact that they were a crippled minority, and could do nothing but pass it as it came from the Senate, proves that the great mass of those who favor the use of silver do so as a matter of sentiment, and without any idea as to its practical effect and working, else they would have seen that silver is not remonetized by this bill, but that provision is made for a limited coinage of silver on the system now prevailing in France. Of course there are differences between our plan and the French plan, the most important being that France does not avail herself of her undoubted right to stab her own credit by paying her bondholders in silver. But it cannot be said that silver has been remonetized here until silver and gold are received at the mint on equal terms. Mr. Bland and Mr. Ewing and Mr. Ben Butler are justified in their complaints. They have not obtained what they set out for. They have done all the mischief they could, but it is only a moiety of what they designed.

Most of the newspapers will have it that the Senate Finance Committee are now considering the anti-resumption bill, or some anti-resumption bill, and are likely to report it favorably. There is the best authority for saying that the Committee have not touched it, and are not likely to take it up until a late day in the session. The passage of the Silver Bill makes some further action on resumption necessary unless we are to witness a national scandal on the first of January next—one law requiring the Secretary of the Treasury to resume specie payments, and another (the Silver Bill) making it impossible for him to do so. But the Committee will postpone action on this dilemma as long as possible, in order to see what the ultimate effect of the bill is upon the gold premium, and how long the Secretary's gold would probably last if he should attempt to carry out the Resumption Act.

Meanwhile the public revenues have fallen below the expenditures, although the latter cannot be considered extravagant, and Congress is too cowardly to restore the duties on tea and coffee, which were repealed some years ago at the instance of the protectionists. Mr. Fernando Wood is not a success as Chairman of Ways and Means. His tariff bill seems to have been constructed on the idea of making something which should be known in history as the Wood Tariff, in the same way that that of 1846 is known as the Walker Tariff, and that of 1861 as the Morrill Tariff. Accordingly, he has gone into the whole subject, from antimony to zebra-skins, and roused the opposition of all the protected trades in the country, while none of his changes are sufficiently in the interest of free-trade (with the single exception of ships) to cause the enemies of protection to bestir themselves for the bill. There was a notable opportunity in this Congress at this juncture to frame a short bill striking at a few of the most glaring and hideous features of the tariff, such as the duties on drugs and medicines, dye-stuffs and chemicals, and certain raw materials, which a portion, at least, of the manufacturing classes would have supported, and which would have rallied the anti-protectionists to the last man. Mr. Morrison approached nearer to this ideal in the last Congress than anybody else has done during the past fifteen years, and there was such a fitness in what he attempted to do that the Morrison Tariff was a name and a signification, although it never became a law. The time was not ripe for the Morrison Tariff then, as it is now. It is possible, but not probable, that some short bill giving the public free quinine, soda-ash, raw wool, copper, etc., may yet become a law.

A few days ago the city was plastered with handbills inviting the public to attend the "Exporters' Convention." Very few persons had ever heard of an exporters' convention, and a good many were drawn thither by curiosity to find out what it might be, supposing naturally that it was a gathering of persons engaged in the export trade desiring to promote measures for their common interest. I attended the meeting in this belief, with some misgiving, however, seeing that the convention was held in a place where no export trade ever existed. It did not take many minutes to find out that the convention did not consist of exporters, but of persons desiring to furnish facilities to other persons to export goods at the public expense. In other words, it was a gathering for the promotion of steamship subsidies, although the use of the word "subsidy" was strongly deprecated by the speakers, as tending to excite prejudice. The applause seemed to be arranged on the plan of the *claque* at a French theatre, coming in at regular intervals with the same strength everywhere. The argument chiefly relied on was the example of England. This perfidious and grasping country having built up her manufactures by protection, eventually adopted free-trade and invited the whole world to follow her example. With the same insidious and designing spirit she had built up a mercantile marine by subsidies, and now she had stopped paying subsidies (except for India), and cautioned other nations not to squander their money on a foolish ocean mail-service. Would we, Americans, allow ourselves to be deceived by such transparent humbug, when our manufacturers are perishing for want of a foreign market, and when we have more iron, and better iron, for steamships than England ever had ? It would not be wise to single out Portland, Boston, New York, Philadelphia, Baltimore, Charleston, Mobile, New Orleans, San Francisco, or any particular port as one to be specially favored in an exporting point of view. The main thing to be settled was that exporting should be gone into systematically, and that the Government should take hold of it. We have no lack of skilled mechanics and accomplished shipbuilders who would lay the keels for a mercantile marine, and fly the American flag, on the most reasonable terms.

This Exporters' Convention must have cost a great deal of money. The bellows were set at work some four months ago, for it was as long ago as that that the veteran free-trade organ of the United States, the New York *Evening Post*, gave its blessing to the project. The efforts of its promoters have been extended to all parts of the Union, and have resulted in raising a perfect roar of disapprobation in California. Hostility to the Chinese immigration has undoubtedly much to do with the opposition to steamship subsidies on that coast. Nevertheless, it has caused some people in that quarter to study the subject from the bottom upwards, and accordingly there is found in a late San Francisco letter to the Chicago *Tribune* a thorough examination of British steamship subsidies, showing that all British ocean mails, except the East India mail, which must be kept up for political as well as commercial reasons at any cost, are paid for by weight like any other freight, and cost no more than the postage received in return. There is another exception in the British service, but it is only an apparent exception—that of the West India mail, the contract for which expires next year, after which the mails are to be sent by weight. The San Francisco writer concludes that

"The whole scheme is gotten up in the interest of the ultra-prohibitionist Eastern manufacturers and shipbuilders, who, after having taxed their fellow-citizens to the utmost extent on all articles they manufacture and sell in the home market, now ask Congress to levy an extra tax on the suffering public to enable this privileged protected class to send their surplus manufactures to foreign markets, and keep up the price of their wares in the home market."

THE WAR FEVER IN PARLIAMENT.

LONDON, Saturday, February 9, 1878.

WE have come to the end of an exciting week, and people are asking, What shall we see next week ? On Monday the feeling of the country was all for peace, and we listened to one of the finest speeches which Mr. Gladstone ever made, in which he urged that the war was over and nothing remained but to arrange a comfortable peace round a council

board—a peace in which Russia was not to get too much, and Greece was to be taken up by England *vice* the Bulgarians, who were to pay smart-money because they would not fight for their emancipation. On Tuesday no warlike ideas were allowed to penetrate our councils, except the war of words which a Cabinet Minister, the Secretary of State for War, had the bad taste to wage against an inoffensive member of the Opposition. Wednesday morning dawned and we were still proclaiming good will to all mankind, and there was nothing to disturb our equanimity except a dull debate carried on by the Irish members upon some question of Irish politics. The Speaker gave a peaceful dinner-party to the members of the Administration, and Count Münster, the German Ambassador, gave a ball, and there, amid the small talk and gossip of the one and the flowers and flirtations of the other, the first drops of the thunderstorm fell. At the Speaker's dinner a red official box was brought in by a Foreign-Office messenger ; it was opened by a member of the Ministry and from it a telegram was taken which was handed round to the members of the Cabinet. Like Banquo's ghost at Macbeth's banquet this official box "displaced the mirth, broke the good meeting with most admired disorder." The telegram announced that the Russians were within the lines of Constantinople, that the Porte was seriously alarmed, and that, as telegraphic communication was suspended, this telegram had to go by Bombay and Alexandria to London. An extemporized Cabinet council was held and a demand at once sent to St. Petersburgh to know the meaning of these movements. At the ball at the German Embassy the Russian Ambassador was present, but he had at once a pleased and an embarrassed air. His vanity was struggling with his prudence ; but the former conquered, and just before leaving he could conceal his exultation no longer, and confided to a friend in an audible whisper the four words which may yet become historical—the four words "Nous sommes déjà dedans." Quiet people who were neither at the Speaker's dinner nor at Count Münster's ball went to bed as usual believing that all anxiety was over. The newspapers in the morning (except two which are supposed to be in the confidence of some of the underlings of the Ministry, who give them occasional bones to gnaw, and sometimes bits of real meat in the shape of early intelligence) made no allusion to the rumors, and the first thing that most people heard of them was the fact that the Lord Chancellor had been summoned from Court to attend a sudden Cabinet council, which was announced in the early editions of the evening papers. The scare was complete. The Stock Exchange was excited beyond all precedent of late years. Rumor was piled on rumor. An influential firm of Jew bankers—the Jews always make a good thing out of the embarrassments of Christians—had bought three millions sterling of Hungarian bonds, and made three per cent. upon the transaction. They had sold consols. Every stock, except the said Hungarians, had fallen. Russians had given way largely, and I don't know what had not happened to Turks. War meetings were extemporized. Crowds were going about the city singing "Rule Britannia" and "Hearts of Oak," and other patriotic songs. Three thousand medical students formed themselves into a procession and marched to the House of Commons, in order that they might cheer Lord Beaconsfield and the Ministry and hoot and hiss Mr. Gladstone and his followers. Westminster Hall and the lobbies of both houses of Parliament were crowded by eager spectators scanning the face of every member of Parliament who passed, and asking for the latest news.

The House of Commons was crowded, every seat occupied, and standing-room appropriated wherever it could be found. The formal business was hurried over, notices of motion given and questions asked rapidly and under emotion, and the answers given by the different members of the Government were curt and hasty. At last, about ten minutes before five, Lord Hartington, as leader of the Opposition, rose to put his question to the leader of the House. Sir Stafford Northcote, without much preface, read the telegrams of the red official box of the previous evening without comment. The House, though prepared by the gossip of the lobbies for the announcement, was for a moment dumb—a most unusual phenomenon in the present House of Commons. Then Mr. Forster rose and somewhat jerkily announced that, under the altered circumstances and the grave aspect of events, he would not press his amendment upon the Government proposal to get a vote of six millions for warlike preparations. It appeared as if we had actually declared war, and as if we might hear at any moment that the ironclad fleet were moored stem and stern against the forts of the Dardanelles, and were engaged in mortal combat. There was no doubt as to the feeling of the House. If Mr. Layard's telegrams were actually true, and the Russians had broken faith and really were marching on Constantinople and Gallipoli, the House for a good three-quarters of an hour would unanimously have supported the Government in the extremest proposal they could make. I do not know whether Count Shuvaloff was present in the House or not, but if he was he could not have failed to see the grim aspect of the case. There was some desultory talk, and it appeared as if the Government were to get their six millions straight off the reel, or sixty if they asked for it, when, at about six o'clock, another red box was handed up the Treasury bench to Sir Stafford Northcote. He opened it, read a despatch, went aside for a minute, and came back in a flutter and begged to be allowed to read an important document which had just been put into his hands. It was a letter from the Russian Ambassador, containing a telegram just received from Prince Gortchakoff, to the effect that the Russian forces had "taken" no forts, that orders had been given that they were not to advance, and that there was not a word of truth in the rumors—what rumors the telegram did not state. The scene was most dramatic. The Ministerialists were dumb ; the Radicals were radiant with delight and noisy with acclamation ; the moderate Liberals and moderate Conservatives were suspicious, silent, and uncomfortable. Then came an interesting but undignified discussion, out of which no party in the House emerged with credit. One set of speakers, including, I am sorry to say, Mr. Gladstone, seemed to dwell with something like satisfaction on what they believed to be the unveracity of our ambassador at Constantinople. Another set threw suspicion upon Count Shuvaloff and Russian diplomatists generally. "Whenever," said one moderate-minded Liberal, "whenever we begin to take some energetic and decided step to counteract some Russian movement, a telegram arrives from the Russian Embassy to say that the movement has not and will not take place." Another Liberal protested that no reliance was to be placed on Russian assurances, and that he and many who were sitting by him were prepared to vote not six but six-and-twenty millions then and there if the Government desired it. Such sentiments we might have expected to hear from the Ministerial benches, but they sounded strange from the lips of Liberals. Lord Hartington rose above all this undignified and panic-stricken action. He asked for twenty-four hours' delay, in order that the truth between the conflicting statements might be discovered. But the excited Ministerialists would listen to no delay, and the no less excited Radicals would listen to no suggestions of pushing on.

It looked like a dead-lock, but the Speaker solved the difficulty by deciding that the question whether Mr. Forster's amendment might be withdrawn should be put to the House, and that if it were withdrawn the debate might proceed on the main question. This course was followed. The tumult dwindled to a calm, and one of the dullest speakers in the House having risen to continue the debate, almost every man in the excited multitude went out of the House—to dinner. And so this scene of anarchy, tempered by telegrams, ended in bathos. On Friday it appeared from what was announced, both in the Lords and in the Commons, that Mr. Layard's telegrams of the previous day were substantially true, though couched in exaggerated language, and that Count Shuvaloff's telegram, though technically accurate inasmuch as the Russians had not "taken" any fort, presented a picture of the state of affairs which, not to put it strongly, was not quite consistent with his enigmatical announcement at Count Münster's ball, and pretty nearly justified the strong assertions regarding Russian diplomacy which were used the previous evening in the House of Commons. There was a manifest feeling of relief on all sides of both Houses of Parliament when it was understood that a strong detachment of the fleet had been ordered to Constantinople, and a universal feeling of satisfaction among all the best and most reasonable men at the determination of Lord Hartington and his immediate followers to support the Government in the crisis, reserving to themselves the full right of criticism, of which they will certainly avail themselves, upon the policy of the Government on the whole question when the immediate crisis is past.

Russia will, it is hoped, take note of this significant change of attitude in England and not press her demands to extremities. She can gain nothing beyond what she can get at present by engaging in a war with England, and if with England probably with Austria too, which must end in her exhaustion—her financial exhaustion, I mean. England does not at the present moment desire a war. She has been actuated by three distinct emotions during the last few months. The first has been a desire for peace ; the second, dislike and suspicion of Russia ; the third, pity and a certain admiration for the Turks. Three weeks ago there was a wide space between the first and second. To-day it is a very narrow one. A very small spark would fire the combustible materials in the

country which would blaze into a conflagration from one end of the island to the other. If the idea became fixed in the people's minds that they had been duped by Russia there would be a call for war which no government or peace party could withstand, and a war once commenced between this country and Russia might be the prelude to a struggle which might not be confined to Russia and England, but might extend its ravages to Asia and Africa. It might set the whole Eastern hemisphere in a blaze. Let us hope that the Gods of the different nations which might be embroiled will otherwise direct.

THE DEATH OF THE POPE.

FLORENCE, February 8, 1878.

JUST four weeks to-day I had to relate to you the circumstances of the unexpected death of the first king of Italy, and now I have to announce the long-waited-for end of the last sovereign of the Roman Church State. I am not able to give you any details, as I did a month ago, first, because I happen to be in Florence, and secondly, because I have no acquaintances in the Vatican, as I have in the Quirinal. The papers only tell us that Pio Nono had an attack of fever on Wednesday evening (the 6th), that the swelling of his legs suddenly ceased, which was considered a very bad sign by his doctor, who immediately summoned his two colleagues, living in the vast palace, and that the agony began yesterday (7th) at two o'clock, after the Pope had received both the last sacrament and the supreme unction. He expired at 5:45, in the presence of more than twenty cardinals kneeling round his bed, while the anteroom was thronged with the *famigliari* of the Vatican. The Camerlengo, Cardinal Pecci, after having confirmed the death in the traditional way—by beating three times the forehead of the deceased with a silver hammer and calling him aloud each time—crushed the pastoral ring, which is the symbol of Papal power, in the consecrated mortar, thereby assuming the temporary government of the Church. He had received from the dying Pope's hands two sealed letters—one concerning the procedure of the Conclave, the other the last will of the deceased—and immediately convoked all the cardinals present in Rome, among whom Cardinals Manning and Du Falloux, who had not left the room during the whole day, are the only foreigners.

The day of the opening of the Conclave is not yet fixed, but I suppose it will be, as usual, the tenth day—*i. e.*, the 17th inst., nine days being traditionally devoted to the funeral. In spite of all the efforts of the busy Archbishop of Westminster, it will be held at Rome and at the Vatican, where the cells are already being prepared in the *loggie* above those of Raphael, after the same fashion used till 1846 in the Quirinal, now occupied by the King of Italy. As you will most likely receive before this the announcement of the new Pope's name, I need not entertain you with my conjectures. Only I may as well let you know beforehand that, if the choice falls on Di Pietro or Morichini, it will be considered as very favorable to reconciliation with Italy and Germany; if on Pecci or De Luca or Monaco la Valletta, as not hostile; if on Simeoni, the present Secretary of State, Bilio, or Franchi, as simply meaning a continuation of Pio Nono's attitude; if on Panebianco, as exceedingly aggressive against Italy, Germany, and the present government of France. As I do not believe that any foreigner will be elected, although there are just now more of them in the Sacred College (26 out of 62) than there ever were before, I do not think it necessary to tell you beforehand the significance of the names whose bearers are considered by some as *papabili*. As, however, only three out of the present cardinals have ever taken part in a Conclave—I do not even know whether one of the three, Cardinal Schwarzenberg, arrived in time in 1846—any surprise may be expected from the inexperience of the sacred electors.

You see that I believe firmly in the election of an Italian Pope, although it requires two-thirds of the votes; and I believe it because I think it will always be easier to bring eight or ten foreigners, most of them jealous and mistrustful of each other, round to an Italian candidate than *vice versa*. And as for the Italians themselves, they are always at the bottom even more Italian than they are Catholic, just as the Italian Liberals are at the bottom more Catholic than Liberal. The one dominating passion of Italians, to whatever party or class they may belong, is patriotism, a feeling which, with all European nations, is fast replacing religion as the one remaining common and ideal motive of our century—by which I do not mean to imply that this ideal motive has always and everywhere the force of inspiring a continued sacrifice of personal interests. He who has witnessed the unanimous, spontaneous, deep emotion of Italy at the death of the King, who represented the fatherland even in the eyes of the pious, will not dispute the truth of what I state. Nothing similar is to be seen to-day. The Pio Nono of 1847 had already become a man of the past to the younger generation, and even those who once so enthusiastically hailed his reforms had grown unable to see in him the patriot he was at heart, and latterly only saw in him the dignified head of the vast institution to which they all remain more or less faithful. It may be that among the rural population the death of the Holy Father will be more deeply felt; in the cities—even in this town of Florence, which has the reputation of being the most *paolotta* (clerical) in Italy—the emotion is one of curiosity rather than of grief; nay, in Rome, where in former days the death of a pope was always a great event, the event seems to be taken very quietly by the population. No doubt the number of those interested in the great lottery of the Conclave, of those who cease to be something by the death of one pope, and of those who rise into importance by the election of a new one, has greatly diminished; and it is in the nature of mankind to feel more deeply interested in an existence on which depend many material existences than in one which represents only moral interests. I also know how very clever the Italians are in what I might call the unconscious turning to profit of their own spontaneous sensations, and I see clearly that they were quite shrewd enough to make political capital out of their own natural feelings of loyalty at the loss of King Victor Emmanuel. Finally, the death of a man of eighty-five, which has been expected, calculated, and reflected upon for years, is in itself as much in conformity with the laws of nature as the sudden death of a strong man in the prime of life, like the King, is apparently exceptional; and so it must strike the popular imagination. Still, taking into account all these considerations, the emotion caused by the death of the King was infinitely more impressive than that we are witnessing at this moment.

It is certain that a reconciliation between Italy and the Church, if it took place now, would be as fatal to Italy as it has proved to Belgium. To this extent, at least, the attitude assumed by Pio Nono has been useful to the new kingdom, and I know more than one far-sighted Italian who wishes sincerely that the new Pope might resemble his predecessor in this respect. As for the interests of the Church, things lie very differently. Pio Nono, although an honest man, of pure morals, a man of wit if not of high intellect, of knowledge of the world if not of books, was exceedingly vain, and his vanity was the evil genius which misled him from beginning to end of his vexed reign. Pio Nono would have been an excellent parson, much admired by his male and still more by his female flock; he had not the strength of mind requisite for the government of the Roman Catholic Church, nor even for that of her temporal state, as long as it existed. It was because he was secretly aware of this that he never forgave the minister of his liberal days, Count Mamiani, for having once called him *un buon pigrano*. But if this responsibility is a very limited one, that of the head of the Church is the most extensive which can be imagined. How did Pio Nono acquit himself of the task thus laid upon him?

I certainly do not intend reproaching him for having allowed the temporal power to be broken in his hands. Even if he had not, more generously than wisely and without any insight into the nature and the conditions of his government—even if he had not given the impulse to the Liberal movement of 1847 and 1848, as he did, or had he remained faithful to this initiative and joined Piedmont in the war of independence against Austria, the temporal power would have perished, and would have perished in this century. Whether we admire it or not, and I for one think it in many respects fatal to the interests of civilization and peace, the principle of nationality is the one omnipotent moral power of our time, and it is in direct opposition to the principle of the Roman Church. Now, Pio Nono, who was so anxious to reconcile both principles, was not aware that by his ecclesiastical policy, which consisted in exaggerating the principle of an universal church, he made that reconcilation more and more impossible. No doubt he only followed the historical current in doing so; but instead of trying to stem that current, he did his best to accelerate it. All religious, as well as political, communities tend towards centralization; and just as Italy, Germany, and Switzerland have consistently and uninterruptedly marched towards unity, so had it been the strenuous endeavor of the Roman Church ever since the beginning of this century to annihilate all national distinctions in its own limits and to concentrate itself more and more.

And together with increasing centralization went increasing despotism. There was the weak point of Pio Nono, which the Society of Jesus knew so admirably how to turn to account. The struggle between the national churches and the episcopate on the one side, Rome and the Papacy on the

other, became a pitched battle under the reign of Pio Nono, ending with the utter defeat of the bishops in 1870. Only it was impossible to obtain this victory without doing irremediable harm to the intellectual value of the clergy. The episcopate had remained even in our days the representative of culture and science (as far as it can go within the Church) against the religious orders, which knew and know only of blind submission, *sagrifizio dell' intelletto*. And the episcopate by its half-worldly, half-national character always remained in contact with the reality of life, with national, political, social interests and exigencies. The monk has no tie whatever of this sort; he is the instrument and servant of an abstract idea, represented by an omnipotent, infallible head, who has himself no bond with the actual world, who is himself not much better than the personification of a logical consequence from an untenable premise. Now, it is the *milizia della Santa Sede* which has triumphed under and by Pio Nono. Is it to be wondered at that the secular clergy itself should have been lowered both socially and intellectually by this predominance? It was Pio Nono whom the Jesuits succeeded in making believe that he was Omniscience—nay, the Almighty himself; it was Pio Nono who extinguished the last spark of theological science which still lingered in the faculties, and replaced it by the irresistible narcotic of a seminary education. Pio Nono did not personally like to see learned prelates around him; he used to sneer at them as pedants; he succeeded only too well in bringing down the level, and, as there are no longer any cultivated minds among the generations of priests brought up under Pio Nono, so are there no longer among them any belonging to the higher or even the middle class of society; it is only the sons of peasants who still consider the church as a career by which to raise themselves above the position assigned them by birth. The future will show whether the Roman Catholic clergy will have gained by this change, and whether the absolute obedience of the poor in spirit and strong in passion will be of more avail than the more independent action of the intelligent, who defended the interests of religion with discernment and out of a rational devotion to it.

We seem to be far from Pio Nono, although in fact we have had him alone in mind in speaking of the Catholic clergy, such as it has become under his rule, and of which he was himself the completest type. Every intelligent reader will understand that a reconciliation of this clergy with the Italian state is not to be wished by the friends of Italy, and why we desire for this country, whose national existence has been once more, and infinitely more powerfully than in 1860, 1866, or 1870, confirmed and consolidated by the spontaneous plébiscite of the nation and the solemn recognition of Europe on the day of King Victor Emmanuel's funeral—why we desire for Italy that the new Pope should not incline towards an understanding with the kingdom.

Correspondence.

GREEK AT VASSAR.

To the Editor of The Nation:

Sir: I am much obliged to you for sending me Prof. Hinkel's courteous note, and shall be grateful if you will make it public.

"Vassar College, Poughkeepsie, N. Y., February 21, 1878.

"*Mrs. Sarah B. Wister*, Philadelphia:

"Madam: Allow me to correct a misstatement contained in your article in the *Nation* of 21st of February. 'In Vassar,' you say, 'a year ago they could get no Greek at all.' The fact is that a year ago fifty-six young ladies elected and studied Greek, while this year the number of students in the Greek classes is forty-eight. By applying to the President of Vassar College, Dr. Raymond, or to the respective heads of the different departments, you will always be sure to get advices with regard to our college on which you may rely.

"Respectfully yours, Dr. C. J. Hinkel,

"*Professor of Ancient Languages, Vassar College.*"

The article on Harvard examinations for women which appeared in the *Penn Monthly* for December was written early in September. I took my facts about Vassar College from a catalogue which had been sent me some months earlier—at that time the latest which could be obtained. This I *feel* positive was of the year 1876, although I cannot *say* so positively, as all the catalogues which I had collected for the same purpose passed from my hands before Christmas; but I am confident that none were of older date. Writing in February I should have said "eighteen months ago," not "a year"; but I was unconsciously referring to the period of my first article. I regret the slip and am very glad that my statement is no longer true; I trust also that the faculty and students of Vassar will understand that it was made neither in bad faith nor altogether without foundation. Yours respectfully,

Sarah B. Wister.

Butler Place, Branchtown, Philadelphia, February 25.

UNDERGRADUATE STUDIES AT THE UNIVERSITY OF PENNSYLVANIA.

To the Editor of The Nation:

Sir: I desire to correct some inaccuracies in Mrs. Wister's statement concerning the undergraduate course of studies in this University, printed in the *Nation* of February 21.

I send you a catalogue of this University for the current year. On examining it you will find that all the studies (not all the text-books), prescribed and elective, elementary and advanced, offered to the undergraduate students of Harvard University are also offered to the undergraduate students of this University, except the following—namely, Hebrew, Sanskrit, Ecclesiastical Greek, Anglo-Saxon, Italian, Spanish, the Institutes of Roman Law, and the Fine Arts.

I am, sir, etc., C. J. Stillé.

University of Pennsylvania, Philadelphia, February 24, 1878.

THE WOOL DUTIES.

To the Editor of The Nation:

Sir: I read with much pleasure in this week's *Nation* your reply to the remarks of Mr. E. B. Bigelow, of Boston, concerning the present duties on wool, etc. Nothing but ignorance could excuse his assertion that the discrimination between clothing wools and combing wools is more nominal than real; and mistaking, as you say, cause for effect in relation to the importation of unwashed clothing wool can only be attributed to the same lack of knowledge. As a manufacturer and importer of clothing wool I only assert what every other importer knows, that at the great London wool-sales, where are to be found the best selections of colonial wools suitable for American mills, more than three-quarters of the lots offered are either washed or scoured, and nothing has hampered the American buyer there so much as the provision of our tariff in relation to washed and scoured clothing wool. That provision, and the fact that the specific duty applies equally to wool costing 8 pence and 15 pence per pound, has shut out the American manufacturer from a proper selection of his raw material, to his great injury.

The prevailing opinion among manufacturers of clothing wool in regard to the present unjust tariff is that it was the result of a combination of wool-growers from New York, Pennsylvania, Ohio, and Michigan, who were interested only in clothing wools, with a party of manufacturers who used only combing and carpet wools. Surely the present tariff bears internal evidence enough of such a combination, and it would have resulted in ruin to the manufacturers of clothing wool had it not been that, like all unjust laws, it bore within itself the seeds of its own destruction. The wool-growers last mentioned, in attempting to foster the growth of merino sheep in their States by an exorbitant tariff, have only succeeded in making for themselves a competition from the trans-Mississippi States which they cannot meet without loss, and which they cannot exclude by legal enactments, so that the time is not far distant when they must abandon the growing of sheep altogether, or turn their attention exclusively to such wools as are suitable for combing purposes and which are grown in England under absolute free trade, and can be grown in our Northern and Eastern States without any protective tariff. While, as a manufacturer, I must always protest against an excessive duty on raw material, I still hoped that the present tariff would be left alone for five years more, by which time it would, in my opinion, work its own cure. The wool-growers of Ohio and Pennsylvania must by this time see the "handwriting on the wall," and it does not need a second Daniel to interpret it. Respectfully yours, Manufacturer.

Providence, February 23, 1878.

REPUDIATED MUNICIPAL DEBTS.

To the Editor of The Nation:

Sir: Apropos to the subject of repudiated State indebtedness, recently considered by yourself and correspondents, is one directly interesting a much wider circle of persons. I allude to the unsatisfied liability of counties, towns, cities, etc., on obligations to pay money issued by them. The amount involved considerably exceeds the total delinquency of non-

paying States, and the proportion of persons who are immediate sufferers is still greater. State bonds are usually held in large blocks, but municipal securities are widely distributed. Nearly all the latter have been issued in aid of railroads and other local improvements of real or supposed advantage to the makers. Some have been unfairly obtained—generally attributable to the carelessness or lack of foresight of the makers—but rarely are the owners either legally or morally responsible for any wrong, having purchased in good faith, and under circumstances imposing no obligation to look beyond the recitals of the bond. The loss in every such case should equitably fall on the makers of the paper.

Then why are obligations of the character described, representing hundreds of millions of money, to-day treated as if they were no better than waste paper? Some communities are overburdened and cannot respond, at least in full, but in most instances there can be no such pretence. Take the case of Missouri, which has more than thirty counties, besides a number of cities and townships, in default, although the State's own credit has been honorably maintained. The county of Jackson, in which is located the second city of the State, has for more than two years paid no interest on bonds put on the market by its own agents. The township of Kaw, in the same county, of which Kansas City is the controlling portion, for an equal length of time has defaulted on the interest of bonds about the equity of which no question has ever been raised. No one will pretend that Jackson County and Kansas City cannot pay all they owe. Their own citizens would indignantly resent such an imputation. The case against other defaulting Missouri communities, with smaller debts, is even stronger. So, in Kansas, the cities of Lawrence, Leavenworth, and Atchison, and several of the wealthiest counties are in default. Some of them have had reverses, but they are much more able to pay than the holders of their paper, as a rule, are to lose; for it is a great mistake to suppose that such holders, notwithstanding all that has been said about "bloated bondholders," are persons of means. The majority of them are comparatively poor. The opportunity to invest small surplusages in securities promising large rates of interest, and which were offered at a discount, induced many persons of limited resources to put all they possessed in Western municipal bonds. Widows with small jointures, old men with narrow provision for their declining years, and small farmers and mechanics that had managed, through rigid economy, to save a few dollars for a rainy day, sought them eagerly, and many such to-day are in great financial distress. The writer happens to know of a "block" of fifty $1,000 bonds, issued by a Western municipality, that was marketed in a manufacturing community not far from the city of New York. Upon a consultation of the holders being called, after default in the interest had been made, it was found that the fifty bonds were in the hands of forty-nine persons, nearly all of whom were in moderate circumstances.

The fact that these bonds can be sued on, both in State and Federal courts, instead of weakening your editorial argument in favor of a right of action against defaulting States, greatly strengthens it. I greatly fear that, but for that fact, many more bonded communities would now be in default. And the steadfastness with which the courts, as a general thing, have upheld the rights of bondholding creditors, against the technical and superficial defences that have been raised, furnishes a powerful confirmatory argument. Even the local courts, whose judges are citizens of communities trying to shirk their honest liabilities, have mostly been true to the law.

But it must not be inferred that, because defaulting counties and towns have been baffled by honest courts in attempts at legal repudiation, all of them have submitted to the demands of the law and their own agreements. The next step with many of them has been *quasi*-repudiation in the nature of a compulsory compromise. Taking advantage of the timidity of creditors in general, and sometimes of their necessities, they have refused to pay, even after all legal questions have been decided, while offering to settle their liabilities by issuing new bonds, no better secured than the old ones, for a fraction of the amount. This new and easy method of paying old debts by scaling them down one-half or more, has become remarkably popular. The creditor is told that he must take fifty cents on the dollar in new paper or he will eventually get nothing. The writer has before him a letter addressed to the holders of certain bonds issued by Buchanan County, Missouri, inclosing a fifty-cent proposition, from a person who subscribes himself "County Attorney and Financial Agent" of the county, and who says:

"Having been appointed the financial agent and general attorney of the county, I should be pleased to be the medium of bringing about an adjustment satisfactory to bondholders and within the power of the county. But I should fail in my duty to both parties if I forbore to invite your serious consideration of the facts as they are, and not as we would like to have them. Grave doubts have been urged before the people and the courts as to the legality of these bonds; but, whether legal or illegal, it cannot be overlooked that universal discontent in the public mind and a determined spirit of resistance manifested everywhere in the West against the payment of municipal bonds threaten the practical collection even of judgments of the highest courts. It may be said that this ought not to be the case, but it is nevertheless true. Organized resistance under the forms of law to the enforcement of judgments of the State and United States courts actually exist in many counties of the Western States, directed and controlled by some of the most adroit and able lawyers in the United States. This ought not to be, but it is true."

Never was highwayman's offer more plausibly put. How coolly the story is told! If true, what a picture the Buchanan County agent gives of the morals of those he represents! "Organized resistance" to the law and the judgments of the courts is treason. If not true, what a libel he perpetrates on his abused fellow-citizens!

That there is in localities throughout the West much of the spirit described by the Buchanan County man is, unfortunately, too true; but it is a mistake to conclude that it applies only to public obligations. Nothing is so contagious as dishonesty. It will not be long until private demands will meet the same treatment. We have a case in point. A Missouri county was sued for interest on its defaulted bonds, judgment was rendered, a *mandamus* compelled the levy of a tax for its satisfaction, when an organized mob, probably directed by "adroit and able lawyers," seized the tax-books and the levy was expunged. But it happened that many of those concerned in the lawless proceeding were persons whose property was mortgaged for money borrowed of non-resident capitalists. How natural it was, therefore, that a resolution should be adopted that they would stand by each other in defeating any attempted sales of their property under court decrees. It was only what might be looked for. The people of a community who will not pay their public debts are not likely to be more willing or prompt to pay their private ones. Those who have goods to sell or money to loan would do well to note the fact.

What is the remedy? Those holding the bonds of defaulting municipalities would do well to consider a few things. Let them remember that their legal rights are not impaired, and if a dishonest fraction is not more powerful than the law of the whole land (which would be an end to all government), and they can afford to wait and use the means, redress in time is certain. Being mutually interested, let them as far as possible combine to meet the expense of legal enforcement of their rights. Let them beware of circulars sent out by brokers assuming to represent the interests of bondholders, and urging compromise on easy terms, as they are employed by repudiating debtors to *bear* their securities, and paid a commission on all the bonds whose owners they can frighten or wheedle into a disadvantageous settlement; and it is by the representations of such persons of their ability to adjust other people's interests at a heavy discount, made in their desire for a job, that more than one Western community has been led to default. Have nothing to do with them. And, finally, let care be taken to advertise repudiating communities as such, among capitalists and business men, not so much for their punishment as for the protection of others. If these recommendations are pursued, it will not be long before such communities will be taught, by inexorable experience, the simple but eternal lesson that "honesty is the best policy."

CREDITOR.

Notes.

LEE & SHEPARD announce 'Twenty-five Hundred Miles in a Canoe,' by N. H. Bishop.——Henry Holt & Co. have in preparation a translation of Auerbach's 'Landolin,' by Miss Annie B. Irish. They will also add Lewes's book on 'Actors and Acting' to their "Amateur Series," with a special index.——A convenient comparative table of the requisites for admission to fifteen representative American colleges, East and West, accompanies the Fourth Annual Catalogue of the Brooks School, Cleveland, Ohio.——A rambling address by Dr. J. N. Toner before the Rocky Mountain Medical Association last June has been published by the Association (Washington) in a neat volume. It opens with some observations on the age of the globe, and closes with a collection of facts in regard to the practice of medicine among the American aborigines. A bibliography of the latter subject is appended, with paginal references.——No. IX. of the *Journal of Social Science* (Boston: A. Williams & Co.) consists of papers read at the Saratoga meeting of the American Social Science Association, last September. Those on "Local Taxation," by William

Minot, jr., "The Tariff Question," by Horace White, and "The Navigation Laws of Great Britain and the United States," by Hamilton A. Hill, are especially noteworthy.

—We have received the third part (*Blotfots-Deksel*) of Koolman's learned 'Wörterbuch der Ostfriesischen Sprache' (see the *Nation*, No. 650). He suggestst hree derivations for Bremen, according to which it may mean either the shore (*i.e.*, brim)-town, or sea-town, or famous town. ——In a decree, dated December 21, 1877, the following works, among others, have been put upon the Index: E. Zeller's 'Legend of St. Peter'; J. Reinkens's 'Ueber Einheit der katholischen Kirche'; Dr. J. Friedrich's 'History of the Vatican Council,' which we noticed last week; and an anonymous work, 'Ist an Christi Stelle für uns der Papst getreten?'——In the German book-lists for January we note E. Brentano's 'Ancient Ilion in the Dümbrek Valley'; an attempt to fix the site of Homeric Troy by the statements of Pliny and Demetrius of Skepsis; and the second edition of F. Delitzsch's 'Assyrian Readings,' partly revised by the originals, partly published for the first time, with an introductory table of characters.

—Mr. Noah Brooks's reminiscences of Mr. Lincoln in *Scribner's* for March are chiefly interesting as showing the President's terrible anxiety, both on the military and the political side, during his term of office; and certainly no estimate of the man's greatness would be complete which should leave out of account his physical and mental endurance under the strain. Several of the anecdotes here told relate to his annoyance by office-seekers, and a sentence from one of these will bear quoting: "I usually find that a Senator or Representative out of business is a sort of lame duck. He has to be provided for." With all Lincoln's concessions to party usage, he often opposed it, or, as we may say, rose above it, through sheer magnanimity. Thus:

"You think that was a foolish appointment," he asks, "because W. intrigued to put Chase on the track instead of me? Now, nobody will deny that he is a first-rate man for the place which he is appointed to, and I am bound to see that his opposition to me personally shall not interfere with my giving the people a good officer."

How applicable, again, to our present condition is the following, and how sound Lincoln's view of his duty! A Senator (it might be Stanley Matthews deprecating the veto of the Silver Bill) urges:

"'You say you are the people's attorney. Now, you will admit that this course would be most popular.'

"'But I am not going to let my client manage the case against my judgment,' Lincoln replied quickly. 'As long as I am attorney for the people I shall manage the case to the best of my ability. They will have a chance to put me out, by and by, if my management is not satisfactory.'"

In confirmation of our remark last week, when reviewing Taylor's 'Four Years with General Lee,' as to the great discrepancy between the number of Federal troops reported present and those habitually taken into action, Mr. Brooks tells of Lincoln's showing him at Hooker's headquarters a scrap of paper containing the figures "216,718—146,000—169,000," and explaining that they represented respectively the sum total of the men on the rolls of the Army of the Potomac, the actual available force, and the numerical strength to which the force might be increased when the army should move.

—In the same number there is a rather tame and superficial, but well illustrated, paper on Guatemala, by a hasty traveller, who is so unfamiliar with Spanish customs in the tropics that he writes: "There are no blinds or shutters, but the fact that almost every window in the town is carefully guarded by an iron grating is somewhat suggestive of the character of the people." That earthquakes are more than once alluded to in this article may well be imagined. Another contributor, however, is able to recount his experience on a United States sloop-of-war wrecked during an earthquake at Santa Cruz by the accompanying tidal wave. The story is well told and is not without its humorous features. The colored camp-meeting, made up of refugees gathered under two great tents, whose inmates relaxed into secular music when the danger seemed past, but immediately, after a smart shock, turned from singing "Dixie" to "the doubly appropriate hymn beginning,

"'On Jordan's stormy banks I stand,'"

cannot fail to excite a smile in those who have never known what it is to feel the solid earth swaying under their feet. We must not omit mention of a timely article by Prof. W. G. Sumner, "What Our Boys are Reading." To the facts of common observation which he sets forth no parent can be indifferent; and the wise will not only seek to replace and repel the vile periodical literature for boys for sale on the news-stands by means of better magazines and papers, but will also be on the lookout for a certain class of respectable books for children, whose unreality and essential vulgarity are akin to the deliberate poison dealt out to them by mercenary publishers. How much simpler was the task of oversight when books were all that children could procure to read!

—We are not on the watch for shortcomings in our contemporaries of the religious press, and, in spite of our recent experience with the New York *Christian Advocate*, we might have passed by the last number of the Chicago *Alliance* but for a red-letter "Take notice" on the forefront of the paper. "After going to press," say The *Alliance* Co., "we have learned that the source from which we obtained our information respecting C. A. Long & Co. is not trustworthy, and we do not endorse the article on p. 155." Thus invited, we turned to the page in question in the full expectation of finding some libellous article which the unsuspecting editor had been beguiled into printing. To our surprise, however, the reference was to a brief disquisition on "Tea" at the end of the department called "The Pastor's Study," conducted by the Rev. Geo. H. Peeke. The topic seemed not wholly out of place, and we began reading as follows:

"To all who have made enquiries of THE ALLIANCE relative to the tea-importing house of C. A. Long & Co., we can say that C. A. Long & Co. stand among the best of tea importers in Chicago, not only in their commercial standing, but in their reputation for handling the best lines of teas at unusually low prices. . . .

"We have received from Messrs. Long & Company samples of their excellent teas, including a splendid English breakfast tea and some elegant drawing Japans, and having thoroughly tested them, can bear testimony to the excellent quality of the goods they sell. In these hard times a good agency for so prominent a mercantile establishment is among the things that ought to be considered desirable. . . .

"After a personal interview which elicited the above facts, and an investigation into their standing, THE ALLIANCE has no hesitancy whatever in asserting that Messrs. C. A. Long & Co. are reliable, and both able and willing to carry out any contracts they may enter into, and we can cordially commend them to such of our readers as business in their line may concern."

Now, as the source from which the editor obtained his information about C. A. Long & Co. was avowedly the firm itself, in a "personal interview," it follows that he brands as "untrustworthy" on the cover the very house which on page 155 he had without hesitancy declared "reliable." His "investigation into their standing," therefore, which enabled him to pronounce them "among the best," appears to have been merely taking their word for it; and we cannot avoid the suspicion that his thorough testing of their samples was effected by the same simple process. The conclusion is, of course, that the publisher sold a half-column of "The Pastor's Study" and the editorial "we" to a "prominent mercantile establishment"; but whether the red-letter retraction is due to the pastor's indignation when he found this out, or to C. A. Long & Co.'s not proving "able and willing to carry out their contract" with the publisher, we shall probably never know. No rates are published in the paper, and it is impossible to say what the *Alliance* Co. charge for vicariously testing teas and attesting commercial standing. Apropos of the spiritual condition of the religious press, we were astonished to find in the literary department of the *Examiner and Chronicle* of this city our recent notice of Godwin's 'Cyclopædia of Biography' reproduced almost bodily, without a hint of its having originated elsewhere. The wicked reviewer copies our statements about the unrevised state of the third edition, and instances just those errors and omissions which we ourselves specified.

—The play now running at the Union Square Theatre, "A Celebrated Case," is the best melodrama that we have seen on the New York boards for several years. It challenges comparison most, perhaps, with "Monte Christo," as given five or six years ago, when Fechter had just come here from England, although there is no one in it who challenges comparison with Fechter himself as he then acted the part. We say this *pace* Mr. Coghlan, who assumed the role of the persecuted hero of the play; for to our mind he lacks the peculiar melodramatic talent which is needed for the unreal world to which "A Celebrated Case" and plays of its kind belong. He is good in the scene where he denounces the false *De Mornay*, his passion is effective; but even here it struck us as passion better adapted to tragedy as distinguished from melodrama. The difficulty with Mr. Coghlan is that he never forgets himself; his character is never merged in that of his part. The part in this instance is certainly one which gives the actor who assumes it a good deal of scope. We have not only a play but a prologue as well, with an interval of twelve years between the two, and every playgoer knows that

this implies a great range of incident. The plot is of the honest, old-fashioned melodramatic sort. *Jean Renaud*, a French soldier (Mr. Coghlan), leaves his regiment on the eve of the battle of Fontenoy to see his wife and child for a few last moments. On his way to his cottage he comes upon a gentleman lying in the road dying of wounds he has just received at the hands of a villain who has run off. *Jean* comes to his help, but it is too late; and the *Count de Mornay* as he expires entrusts to the soldier a box containing his family papers and jewels of great value. These he carries back to his cottage, confides to the keeping of his wife, and goes off to rejoin his regiment. Hardly has he disappeared when the murderer of the Count enters the cottage, secures the box containing the De Mornay valuables, compels *Jean's* wife, while struggling for her life, to quiet her child's fears (the child being shut up in the next room) by telling it that she is with her father, and finally kills her and escapes. The next day Fontenoy is fought, and *Jean*, promoted for gallantry, is suddenly confronted with the charge of having murdered his wife. The proofs against him are made conclusive by the evidence of his child, who recollects that her mother just before her death had cried out that she was with her husband. *Jean* is sentenced to death, but his punishment is commuted to the galleys for life on account of his gallantry.

—This brings the prologue to an end; and it may be easily imagined that in the play we have the child, *Adrienne* (admirably played by Miss Linda Dietz), grown up, the adopted daughter of the *Duc d'Aubeterre*, governor of Provence, surrounded by luxury, engaged to the young and handsome *Raoul de Langey*, and little dreaming that she is in reality a convict's daughter. Strange memories, however, float through her brain, particularly of a scene in which some one calls upon her to remember that she has been the cause of his death, but that he forgives her. Needless is it to say that the scene in which she describes these haunting memories to her dear friend *Valentine de Mornay* (excellently played, when we saw it, by a lady whose name was not given on the bill) is followed by the appearance of a gang of convicts (R. U. E.) of the most abandoned character, who sink down in a sort of criminal stupor, while one of them, squalid in dress but noble in mien and bearing, wanders slowly to the footlights and throws himself down disconsolately in full view of his daughter and her friend. Needless to say, either, that an *éclaircissement* follows; that *Adrienne* finds in the convict a father, and devotes her life to clearing him from the stain of his conviction. It would not require a prophet to predict that a doubtful-looking character bearing the title of *De Mornay* would now make his appearance, or that he would have in his possession the very identical box carried off in the first act; nor that he should be in fact the very villain who twelve years before robbed the cottage and murdered *Jean's* wife. Mr. Hardenberg, who has in his time played every description of villain known to the stage, looks the false *De Mornay* very well—so well, indeed, that it is evident from the first that his real character will be unmasked before long. And so it is. Does not *Dennis O'Rourke*, the retired Irish sergeant formerly in *Jean's* regiment, see through the sham at once? Does not *Jean* denounce him, and does not the old chanoinesse in whose care the real *De Mornay* had left his daughter *Valentine* as a child expose him as soon as he introduces himself to her? Finally, is not the fact of the robbery and murder fully established by the discovery among the De Mornay jewels of a necklace belonging to the murdered wife? So all ends happily: *Jean* is restored to society and his daughter, and his daughter is married to *Raoul*, and the murderer no doubt gets justice meted out to him in the brimming measure which the law allowed in those days. The acting throughout is very fair and often very good. The child in the prologue was marvellously good. There are always grave reasons, it seems to us, to doubt the propriety of introducing children on the stage at all; they are disconnected (so long as they remain children) with the action, and they are introduced for the purpose of imparting an air of reality which they do not actually give. With their childish ways and their oddly-recited parts, they are so much more unreal than anybody else that they help to destroy the illusion created by the rest of the company instead of adding to it. But if children are ever permissible on the stage it is certainly such children as little Miss Eva French, who acts the part of *Adrienne* in the prologue to perfection.

—Recent files of the Vienna press describe the first performance in that city of Wagner's "Rheingold," the scenic overture to the Nibelung trilogy. These papers are almost all hostile to Wagner, and lose no opportunity of abusing him, and yet, in spite of all they could say and do, Vienna has become the centre of that progressive spirit which has converted the music of the future into the music of the present. Dr. Hanslick, the well-known leader of the Conservatives, feels bound to admit now that "Wagner is one of the favorites of the German public, and those who do not love him know at least that among living opera-composers he occupies not only the first but the only place for originality and grandeur of style." How grandeur of style is compatible with the total lack of form of which he accuses Wagner, we must leave for the learned doctor himself to explain. Another critic mournfully admits that Wagner has now taken complete possession of society. "The rising generation favors him, the ladies favor him, and of late even a certain band of savants." These critics, however, still boldly keep up their opposition, in order not to break the tradition and confute Schumann's statement that musical critics, unless themselves creative, are always behind the times. Last year they were very much depressed by the fact that the "Walküre" was repeated in Vienna twelve times in rapid succession, to crowded houses, and was only suspended when Frau Materna and Hans Richter had to go to London. This year they have again raised an outcry over "Rheingold." They protest against "the indigestible German which is stammered in 'Rheingold' and given out as poetry." The music is not "organic," but "atomic." The story is "devoid of all dramatic interest," and "compounded of ugly passions and crimes." The wonderful scenic contrivances are "a wealth which shows that it has poverty to conceal." So says Hanslick, and the smaller fry re-echo his words. The performance, as a whole, was "decidedly superior to the model performances at Bayreuth." So was the Vienna performance of the "Walküre"; and those who know Dr. Hanslick feel certain that he would have said the same of the American attempt to reproduce the latter drama. From the other accounts, however, we gather that the scenic display, which at Bayreuth subserved artistic purposes, was in Vienna calculated chiefly for effect; that the old sing-song vocal style, banished from Bayreuth, made its reappearance here; that the Walhalla and the rainbow scene were as imperfect as at the festival; and that the important swimming scene, which at Bayreuth was unanimously pronounced a most perfect specimen of stage mechanism, was in Vienna so defective that the mechanical apparatus was plainly visible to a large portion of the audience. The most amusing of the objections repeatedly urged against "Rheingold" is that its hero, *Wotan*, is such a very wicked character. These good critics had evidently never before seen a bad character impersonated on the stage, and it is a wonder some of them did not waylay Herr Searia when he left the theatre and give him a sound beating.

UPPER EGYPT.*

FROM 1863 to 1869 and from 1872 to 1875 Dr. Klunzinger, a naturalist and physician, lived at Koseir, on the Red Sea, as sanitary or quarantine doctor, appointed by the Egyptian Government. Private and official business often carried him into the neighboring portion of the Nile Valley, the ancient Thebaid. Shortly after establishing himself at that little seaport, and repeatedly afterwards, he was visited by the explorer Schweinfurth, who now pays a glowing tribute to his attainments—including a surpassing knowledge of Arabic—and to his devotion to scientific pursuits and the good of suffering humanity. Schweinfurth encouraged him to cultivate the field of Egyptian manners and customs, taking Lane as his model. The facilities of the learned and devoted physician were uncommonly good; the quiet yet not entirely secluded spot where he spent eight or nine years of cheerful activity proved a varied and almost untrodden ground for study and examination; and the results obtained are now before us in elaborate descriptions of unusual interest and exhaustiveness. The author, who is neither an explorer nor a traveller in the stricter sense, but a studious and closely-observing Occidental resident of the East, gives no account of his journeys, but takes the enquirer by the hand, passes with him from scene to scene, unfolds feature after feature, completes the observations of others by his own, points out the hitherto unobserved, often compares the modern with the ancient, and presents generalizations with moderation and reserve. What he means to tell is fully stated on the title-page of the book, and everything else—statistics, politics, history, philological research, antiquarian criticism, etc.—is scrupulously excluded. There is no fanciful flight of

* 'Upper Egypt: Its People and its Products. A Descriptive Account of the Manners, Customs, Superstitions, and Occupations of the People of the Nile Valley, the Desert, and the Red Sea Coast, with Sketches of the Natural History and Geology. By C. B. Klunzinger, M.D., formerly Egyptian Sanitary Physician at Koseir, on the Red Sea; member of the Gesellschaft für Erdkunde zu Berlin, etc., etc. With a Prefatory Notice by Dr. Georg Schweinfurth, author of the 'Heart of Africa.'' New York: Scribner, Armstrong & Co. 1878. 8vo, pp. xv–408.

diction, no pretentious coloring, no trace of an inclination to beautify or to distort, to round off or to contrast, and none of a religious or anti-religious prejudice ; ethnological dogmatism, obtrusion of sentiment, and repetition are rigidly avoided ; every statement bears the mark of clear and unbiassed observation and truthful presentation.

The work is divided into the following seven chapters : "Four Days in a Country Town," "Travelling by Land and River," "Working Days and Holidays, Days of Jubilee and Days of Mourning," "The Desert" (between Kenneh on the Nile and the sea), "On the Red Sea" (Koseir), "The Natural Treasures of the Red Sea," "Popular Beliefs and Superstitions." The subdivisions are exceedingly numerous, each being devoted to a special topic. The topics are treated as they locally present themselves in that portion of Egypt—Upper Egypt, between the Nile and the Red Sea—which forms the special subject of the author's research ; but, owing to the stability and consequent uniformity which characterize the main sphere of Islam, they are mostly endowed with a general character, and we feel that we have before us not only views of life among the descendants of the people of Pharaonic Egypt, among the Semitic Bedouins of the desert, and modern Ichthyophagi, but also pictures of the universal Moslem "still-life," with its poverty and indolence, resignation and contentedness, fatalism and superstition, sobriety and frugality ; its fasts and feasts, muezzins, dervishes, jugglers, pilgrims, and cadis ; its veiled women, obedient children, and secluded households ; its exceptional polygamy, patriarchal slavery, and fidelity to law, custom, and ruler.

Upper Egypt is one of the quietest parts of the subtropical world. It is entirely undisturbed by the din of war, threats of invasion, or hostility of race and religion—Mohammedan Arab and Christian Copt living peaceably together under a tolerant despotism ; and it is, perhaps, equally distant from the barbarism of Central Africa and the civilization of Western Europe. Centuries pass over it without working perceptible changes in the manners and appearance of the people. Those who speak Arabic and profess Islam differ little in speech, dress, and habit from the type of their ancestors in the times of the early caliphs. "We shall even go farther," says Dr. Klunzinger : "Let us pick out at random a man belonging to the common people of Upper Egypt and divest him of his modern outer dress (loose shirt and turban) ; let us strip him of his undoubtedly thick varnish of Mohammedanism, or it may be of Christianity; take from him his pipe, his coffee, and his beard, and there stands before us a genuine native of [Pharaonic] Kemi. He will be sure to exhibit the same slim yet strong limbs, the broad chest, the same type of face with its broad cheeks, projecting lips, wide nostrils, and almond eyes ; also the same solid shaven head, and, in spite of all the buffets of Fate, at bottom the same inherited nature. In Upper Egypt, too, we find, lastly, a multitude of individual customs and usages dating from the great Pharaonic period." The pointing out of striking resemblances between the doings, ways, and methods of the modern Fellahs and Copts and those of the subjects of the early Pharaohs is, in fact, one of the many pleasant features of the book before us.

The Fellah, or countryman, of Upper Egypt is almost as dark as an Ethiopian, well formed, spare, muscular, and full of endurance. Young people of both sexes have agreeable and even elegant forms, but old age comes on early, and female beauty is rapidly changed into caricature. The Fellah's food is generally coarse and heavy ; he seldom allows himself a dainty ; spirituous liquors he never tastes ; tobacco alone is his common indulgence. A wife and family are indispensable to him. He lives in an earthen burrow, which is very far from being either spacious or clean ; his children mingle in the court-yard pell-mell with all kinds of domestic animals ; but "from his contentment and domesticity he is always merry, he chats, jokes, and sings, is healthy, and incredibly efficient and assiduous in working. . . . He knows how to conduct himself with propriety, almost with polish, in society ; he may be often rough, but he is never rude and boorish. . . . Compliments flow from his eloquent tongue till they verge on flattery and falsehood. He is entertaining, witty, full of fancy, good-humored in ordinary intercourse and if at all well treated ; but he is mendacious, deceitful, avaricious, fond of begging, and even thievish. . . . Patiently, like the camel, he bears the burden laid upon him ; but if it seems too heavy he becomes stubborn and self-willed, until he has received a due number of official blows upon the soles of his feet." Dr. Schweinfurth, in his preface, also speaks of the Fellahin as, in spite of their degradation, "excelling in several virtues which only the wisest among us practise, and that only with an effort," and as "the most courteous and mannerly people in the world." The hands of the tax-gatherer and the task-master are heavy on them, both in lawful and unlawful ways ; but while formerly the sums and the labor extorted went only to benefit the rulers, now, Dr. Klunzinger is convinced, a large portion of the proceeds is expended for the good of the country. The Fellah still boasts in his ignorance of the stubborn resistance which he opposes to the lash of the collector, but his children and children's children will derive no small advantages from the schools, canals, bridges, and railways on which the Khedive lavishes so much of his income.

The kind of culture, justice, and humanity which prevails in the towns of Upper Egypt is pleasantly illustrated by the following scene in a court, the description of which we abridge : The youthful son of a merchant, the descendant of the Prophet (sherif), has knocked out some teeth of a highly-respected citizen, who appears as accuser. The judge strokes his whiskers and beard, veils his figure in tobacco-smoke, and calls for his scribe. A record must be taken. Messengers are sent through the town. Muftis, old citizens, leading traders, consular agents, civil and military dignitaries soon fill the court. The assembly hears the accusation in silence. The accused stammers a few words in his defence. His father upbraids him, and expresses deep sorrow, but attempts a defence with animation and all the dexterity he is capable of. The youth looks shame-faced upon the ground ; friends make some remarks ; some of the spectators give tokens of approval ; the record becomes lengthy ; a physician gives an opinion. "To prison with the offender!" is the loud decision of the judge. "My son sent to prison—the son of a sherif!" exclaims the father ; "I will become surety for my son." Silence follows : the judge hesitates. Justice and religious considerations plead in opposite ways. A pause occurs. Those present sip a little coffee out of small cups, venture some indifferent remarks, or go out and in. The cadi, or ecclesiastical judge, who, in fairness, has no say in the matter, now puts in his word : "First of all, a *fatiha!*" All lift up their hands and solemnly utter the prayer of prayers. Then the cadi goes on : "Serious things have taken place ; but God is the all-pardoning, the all-merciful. The prosecution of the action would lead to incalculable consequences. Accusers and accused will become reconciled ; I pledge myself to that. For your part, your grace, desist now ; God will reward you." But the civil judge will not yield, and hurls reproaches at the sherif, who, on his part, makes taunting observations. The affair assumes an unpleasant aspect. The cadi now stands up with all the dignity of his person and office, and pleads for pardon as a favor to himself. The pious civil judge is unable to resist ; the parties become reconciled ; the record and the physician's opinion are solemnly torn in pieces ; and the scene closes with a round of embraces, a cup of sweet coffee flavored with cloves, and a *fatiha*. There are also inexorably upright judges, but they are decried as tyrannical.

Among the Ababdeh, a tribe of the desert to whom Dr. Klunzinger devotes a considerable number of pages, justice is administered by their sheiks in a much sterner way. The Egyptian Government levies no taxes or soldiers among them, but their prince pledges his life and property for the security of the desert roads, and must, when required, provide camels and guides. And, in fact, profound peace and absolute safety reign in their inhospitable region. The following is told as having occurred within the last few years : A camel, laden with fruit, which had strayed from a caravan, was found by a Bedouin in the Nubian desert. He brought it to the nearest station, with its load, but betrayed his having peeped into the sack to see what it contained. For this curiosity he was condemned to death; "for," said the sheik, "if there had been gold in the sack you would have stolen it and not brought back the camel."

In describing the desert, the author adds his observations to the many delineations that travellers have given of the camel; and we cannot refrain from reproducing the opening lines, as a sample of his minutest descriptions. We quote :

"Its skull nearly always points exactly horizontally out into the wide world toward the distant goal. At the top its small, erect, ape-like ears stand beside the small cranium. Its eyes, at the side of the skull, stare earnestly, or even, as Brehm will have it, stupidly out of their cavities, surrounded by the protruding edges of the bones and overshadowed by high shaggy eye-brows. The forepart of the crest of the head forms a long nose like that of a ram, the nostrils of which unite at a sharp angle. A long, broad, bearded upper lip, half-divided in the middle and sloping downwards in front and at the sides, a loosely pendent but extremely mobile under-lip, between which opens a slavering mouth well furnished with broad, yellowish teeth, complete the very far from pleasing picture of a camel's head."

The sketch of a ride through the desert is probably the finest descriptive part of the book ; and musings on the East and West, the world of

Islam and the world of modern civilization, are thus adroitly, and not idly, woven into it :

"From the stars our thoughts wander to the countries of that more northern region to which we belong ; we recall to mind the blessings derived from the superior civilization of the soil, the flourishing state of art and science, the mighty advances made by commerce and industry, the order in civil and political life, the power and riches of the nations, lastly, the power of public opinion, fighting on the side of justice and morality. Directly the contrary of all this is what we see in Mohammedan states. But we find that amidst the blessings of civilization there swarm all kinds of gnawing, cancerous sores and examples of glaring wretchedness ; and the Frank is by no means justified in always looking down upon the Oriental as the sick man. The Moslim is essentially a natural man guided by faith in his religion, which, when rightly interpreted, is as capable of giving him the stamp of a good man as any other. That art and science can flourish also on the soil of Islam history shows, and that a Mussulman who is a true believer is not necessarily a fanatic, any one may convince himself who has an intimate knowledge of both country and people."

We should need much more space than we have to do justice, by extracts or allusions, to the richness of the work. It is worth reading and rereading. The illustrations are very fine ; the translation is excellent.

THIRLWALL.*

THIRLWALL was a bishop whom nature intended for a judge. Judicial weightiness—the quality which the Romans designated as *gravitas*—was the distinguishing trait of his character. Men who heard him speak, when young and unknown, were at once impressed with the weight of his thought. "The speaker," writes Mill, describing his experiences as member of a youthful debating society, "with whom I was most struck, though I dissented from nearly every word he said, was Thirlwall, since Bishop of St. David's and then a Chancery barrister, unknown except by a high reputation for eloquence acquired at the Cambridge Union before the era of Macaulay and Austin. His speech was in answer to one of mine. Before he had uttered ten sentences I set him down as the best speaker I had ever heard, and have since heard no one whom I set above him." What impressed Mill at an age when he was full of faith in logic and Benthamism was, it may safely be assumed, no display of rhetoric but an exhibition of that power of fairly coping with the strength of an antagonist's argument—of, in short, judicially weighing its merits—which is to be traced in every word written or uttered by Thirlwall from his early manhood to the latest day of his life. His strength lay exactly where his colleagues on the episcopal bench are apt to be weak. A modern English bishop is always respectable. He not unfrequently is distinguished by undoubted virtues. He is occasionally a man of considerable administrative ability. He is sometimes, though rarely, a person endowed with talents which must have ensured his success in secular pursuits. But the quality which the world does not expect, perhaps it may be said hardly asks for, in a bishop, is the discriminating fairness and breadth of view which you may look for in a great statesman or a great magistrate. There are perhaps not at the present moment three men on the English bench of bishops whose opinion on either a question of statesmanship or a subject of speculation would carry any weight with the world of laymen, either in England or America. Whilst Thirlwall lived, the English episcopacy had at least one member whose words neither politicians nor thinkers could hear without respect.

In nothing was the strength of his character better exhibited than when he dealt with topics which are rather political than ecclesiastical. Take, for example, the following description of the union between England and Ireland :

"The union had the legal force of an act of Parliament, and even of a solemn treaty, but morally it was a mere name, a fiction, a piece of parchment utterly inoperative for its professed purpose. It neither expressed a fact nor tended to realize the supposition which it assumed. The cry for its repeal never ceased to awaken an echo in the Irish bosom, and the most important boons lost all their conciliatory value because they appeared not the free offerings of our good will or of our justice, but concessions wrung from our fears."

These sentences and the whole passage to which they belong are, in one sense, not striking, for they are only the plain statement of undoubted facts. What is impressive is, that on a subject concerning which it is difficult either for historians or for politicians to speak with calmness and fairness, an English bishop should give utterance to what will, it may confidently be predicted, be the ultimate verdict of impartial history. Nor is Thirlwall's severe calmness of judgment confined to historical problems. In no speculative discussions is a fair recognition of plain facts more rare than in arguments concerning the relation of the state to religion. Because thinkers of one school have drawn from the fact that religious belief influences the political and social condition of a nation the inference that a Government must impose its religion on its subjects, their opponents, shocked at conclusions which they felt to be erroneous, have denied the truth of a premise which hardly admits of doubt. Amid the endless confusions of a controversy rendered difficult by differences of sentiment and ambiguities of language, it is an unspeakable comfort to meet with the following plain statement of fact :

"The proposition that anything which exercises such a powerful influence on the habits, character, and condition of a nation as religion may be viewed with indifference by its rulers, appears to me an extravagant paradox, and a person who should profess that he can discover no ground for preferring one form of religion to another seems only to betray his own deficiency in the most essential qualifications of a statesman."

These sentences of course do not solve, or profess to solve, the problem presented, or attempt to lay down the right relation of a government to the religion of its subjects. For hints towards the solution of the problem the pages from which this sentence is taken should be studied. What is noticeable for the present purpose is the boldness with which Thirlwall admits the truth of a proposition which has constantly been made the basis of theories to which he was fundamentally opposed. It is, in fact, this fairness in stating the arguments of an opponent which constitutes the special strength of a great judicial intellect. To misrepresent the reasoning of an opponent is the vice of a controversialist ; but many men who rise morally and intellectually above controversial misrepresentation have not the power to grasp the really strong point of views which they do not share ; and there is nothing which excites more justifiable admiration than the power exhibited by men who adorn the judicial bench of stating in its full force a case the whole weakness of which they are able to expose. This is exactly what Thirlwall achieves as a controversialist. The excitement caused by the publication of 'Essays and Reviews' has died away even in England. The sound of the controversy as to the "conscience clause" can have been heard by few persons on this side the Atlantic, but Thirlwall's criticisms on the views of some of the essayists and reviewers, and his only too complete refutation of Archdeacon Denison's fallacies, have a permanent interest as specimens of polemical discussion carried on with judicial fairness.

A minor peculiarity of Thirlwall's has a close connection with the essential quality of his mind. The grave dignity of his style is perpetually flavored by more or less conscious irony. The irony is quite unlike that of a writer who delights in sneers. It is the irony of an author who habitually appears to have more to say than he actually expresses. There is a constant restraint of language which arises not from hesitation but from the determination of the writer to express exactly what he means, and not to hazard the least assertion beyond what his knowledge justifies and the facts of the case require. The very attitude of calmness naturally occupied by the bishop stands in a sort of ironical contrast with the excitement, the fume, and the fussiness of the clergy whom he addresses, or of the brethren from whose course of proceeding in convocation he ventures to dissent. Occasionally, indeed, the irony expresses itself openly in some terse but grave retort. A generous friend of the essayists urged with more generosity than logical cogency that their errors were in some cases to be held trifling because contained in "a few words." "Yet," is Thirlwall's comment, "four monosyllables have sufficed for an important proposition which it would be difficult to bring within the limits of devout belief (Ps. liii. 1)." Other instances in which irony turns to sarcasm might easily be pointed out in the bishop's charges, but in the main what is ironical in his style is the careful, painstaking, deliberate weighing of reasonings and views which he shows when fairly weighed to be if not worthless yet certainly of much less value than they seem at first sight to be. Now, this is precisely the irony of a judge. To hear a man of first-rate ability weigh with the most minute care every particle of evidence which can be brought forward in support of a case which the more it is examined the less tenable it appears—to hear such a man suggest the arguments which an incompetent advocate has omitted to put forward, and then show that when the best is said for the prisoner which can be said his guilt is as clear as the day, is a treat which may be enjoyed in any court of justice presided over by a great English or American judge, and those who have once enjoyed it will not need to be told how keen is the inevitable irony of the application, to a bad case, of perfect judicial fairness.

* 'Remains Literary and Theological of Connop Thirlwall, late Lord Bishop of St. David's. Edited by J. J. Stewart Perowne, D.D.' London : Daldy, Isbister & Co. 1877.

The assertion that Thirlwall's mind was essentially judicial, is, on the whole, to give as high praise as can be given to the moral and intellectual character of a man placed in a position rarely adorned by judicial virtues But it must be added that the peculiar type of intellect which distinguishes a judge has its weak points, or, at any rate, its limitations, and Thirlwall was, in some respects, too exclusively judicially-minded. We do not mean by this that there is any want of religious depth or feeling in his charges. If any one suspects this want, he will, if he reads carefully the bishop's tenth charge, feel that this suspicion is ungrounded. What we do mean is, that in two respects, at least, he shares marked characteristics or peculiarities of English judges. His fairness, as far as it goes, is perfect. He looks an opponent's arguments carefully in the face. He states them, as far as he is concerned with them, in a forcible manner, but he does not attempt, or think it his business to attempt, to enter into the feelings of the men he criticises. He is a judge though a fair judge. In taking up this attitude, it is at least perfectly arguable that Thirwall was entirely in the right. The merit of sympathetic, as contrasted with fair criticism, is open to great doubt. The attempt to enter into feelings which you do not in reality share, constantly fails in attaining its object; and, further, is apt to lead to confusion both of thought and feeling. In any case the bishop was distinguished from the men of his time by the absence of all attempt to show sympathetic appreciation of views which he held erroneous.

A second and far more serious result of the judicial habit of mind was an unmistakable tendency on the part of Thirlwall to limit his view, or, at any rate, his utterances to the precise matter in hand (or, in forensic language, to the circumstances of the case). In a magistrate this habit of dealing in every instance with general principles only in so far as they are requisite for the decision of the particular point under consideration (though even on the bench it may be carried too far) is of value—it is encouraged and fostered by all the traditions of English law; but in a speculative writer the same tendency would admittedly be a grave defect. The subjects with which Thirlwall dealt—*e.g.*, the historical character of the Pentateuch, the views propounded by clergymen as to inspiration, and so forth—admitted to a certain extent of either treatment. They might be treated in what may be termed their legal aspect; they might again be considered in a speculative point of view in respect of their truth and falsehood. Now, Thirlwall indubitably tends rather to dwell upon the legal and ecclesiastical aspects of the controversies with which he is concerned than to examine the ultimate truth or falsehood of the opinions he criticises. He gives guidance to men interested in the question whether certain opinions can or cannot be held within the Church of England. He points with great force to all the considerations which should lead Churchmen of different parties to deal fairly with each other's views. He makes valuable suggestions as to the mode in which the difficulties raised by Biblical criticism should be viewed. He cannot be fairly said to shirk any question necessarily brought before him. He treats "Colenso's case," to use a legal expression, perfectly if it be looked upon merely as "Colenso's case." What, however, really and rightly interests the laity is not "Colenso's case," but the questions of the truth or falsehood of sacred narratives which the "case" raised. On this, the vital point, we can hardly feel that the charges contain all that a man such as Thirlwall could have uttered. Yet, if in this point they are defective, they are constant and noble assertions, by the great judicially-minded bishop, of the almost forgotten doctrine, that "the formation of a right judgment" is "an important part of practical duty."

Fine Arts.

ELEVENTH EXHIBITION OF THE WATER-COLOR SOCIETY.

II.

THE figure-pictures are, as always, the most attractive. "A Rose in October" (12), by Mr. Abbey, represents a handsome girl in the high waist and fichu of 1820, standing by a gate in an autumnal scene. Her refined face, autumnal too, and just settling into a sweet, unprotesting old-maidishness, commands attention as a piece of distinguished character is sure to do; but it is unskilfully colored in thick plastery distemper, and the folded handkerchief, of a bad staring white, makes a hard St. Andrew's cross in the middle of the composition. The picture, like all of Mr. Abbey's work in color, is a promise rather than achievement. "The Cobblers of Boufarik" (145), by Tiffany, is a humorous incident; four shoemakers, all in a row, arrest their wax-ends simultaneously to stare at the supposed arrival of a stranger; their expressions were never learned in courts; a grin of hideous curiosity, exposing snags of teeth, and a canine readiness to fawn on the traveller, make up their sum of intelligence; it is the eternal cry of "Bakshish," represented in colors on a sheet of card-board. This is a picture of considerable size, and, though thin and flimsy in modelling, it has less of the amateur about it than former experiments of Mr. Tiffany's with the human figure. Mr. Magrath has a number of pictures of his well-known Irish maiden, in various rustic postures, looking for her lover from the cottage threshold, etc. This country beauty was hailed with delight when she first appeared some years ago; but, whether she was better painted then, or taste has grown more exacting, a longer acquaintance has brought out her defects. The drawing is now seen to be conventional and soft; the face just enough idealized to spoil it. How hard is the task of painting rusticity in a perfectly sincere frame of mind! If even Jules Breton is accused by his compatriots of refining too much upon his farming-maidens, how shall Mr. Magrath escape a like censure when he gives us an eternity of those white dimpled feet, those odalisque eyes, in scenes that should reflect the honest hardness, as well as the unspoiled soul, that dwells with "country brown"? The picture of a "Gardener" (123), and of "Sheep" (267), are in an improved vein. The miniature scale of the former reduces the stippling habit, which becomes painful and insipid over larger surfaces, to an almost imperceptible condition, from sheer compression of work; and the little plodding gardener becomes a distinct and valuable gem, a curious example of the artistic axiom that largeness of style may be best shown on smallest work. As for 267, perhaps because stippling agrees with sheep, or for some reason, the style, which it would be offensive to call woolly, and which we will therefore term fleecy, seems to grow homogeneously out of the subject and suits the pastoral idyl depicted.

Signs of real vigor in figure-painting we are glad to hail in two of the contributions of Mr. Eakins. The most finished (237) is a picture of an old lady, of an excellent type of face that dates perfectly with the title of "Seventy Years Ago," knitting, with that angular throwing out of the forefinger which goes with the work; she sits between the spinning-wheel and round falling-top table, her well-made, tendonous arms escaping out of short sleeves, and at her feet her basket of wools, edged with intersecting arcades of wicker. The color here is a poem of subdued harmony, partly because the touch, as broad and direct as possible, has not persecuted the color. How much better it is to leave a part of a painting in a sketchy state of definition rather than to insist upon an item of drawing already plainly suggested, and so make your color dead by overlaying it, is well expressed in this very happy study, and perhaps still more clearly in the larger picture, "Negroes" (92), where, indeed, the sketchiness seems to have been in some sort a necessity; the painting somehow suggests that the artist might not have been able to carry a labor of such a size much further in finish without stirring up mud. As it is, there is not the slightest concession to the eye of the conventional spectator demanding evenness of manipulation. Foreground parts are left in riotous disorder, and parts on the second plane, at which the painter desires to direct the attention, are worked up with sympathy and patience. The theory of method seems to be that, if a broad, careless stroke has been lucky in defining the form and motion and in imprisoning the color, it is a better thing to leave it, whether consistent in style with the whole picture or not. These telling strokes and sweeps, these foreground forms felt as mere blots of color, these nearer members without outline while farther

feature. are modelled and hardened with all precision, give the system of painting a perspectiveless look when seen close, and a look of pure atmospheric harmony when seen from the proper distance. The comedy of plantation life is felt by the painter of this picture with a quiet intensity that makes every onlooker sympathetic. The precocious solemnity of the child who is learning to dance, and whose bare legs have absorbed all the liveliness away from his face; the weight of warning in the countenance of his grandfather, who "pats" for him with the foot, and is ready to pounce on an error; and the serpentine insinuation of the banjo-player, who writhes and twists involuntarily to help on the motion, make up a group of goblin humor so true and intense as to notch a pretty high mark in the degrees of comedy.

Mr. La Farge sends a first sketch, or crude conception (348), of a spirit-figure with moth-wings. Nothing could show the peculiar mastery which this artist has over a careless public more than the fact that in this experiment, almost insulting in the largeness of the demand it makes on the imagination, it is conceded by everybody that the thing could have been done only by an artist of talent. It seems to be a record, fixing in the memory what hues to take for a certain effect, as standards to "key up to." Meanwhile the poor nymph, waiting to be born, exists at loose ends, with a complexion made up of moth-patches; through her untextured state and unregeneracy, though, there streams out the impression of a soul of unusual distinction, and when this sketch is developed into some striking fresco or glass-painting, the purchaser—the first buyer of any exhibition-picture by this artist—will doubtless look back on his courageous action with pleasure. There is a small class of Americanized foreigners, exhibiting as members or as New-Yorkers, but painting with methods as strikingly European as the talk of strange tourists you hear in the street. One of the most conspicuous of these is Pranishnikoff, whose address is with the Messrs. Harper, in Franklin Square. He gives two or three figure-scenes from Russian life, and a miscellany of sketch-book extracts, altogether quite a little gallery or collection, which might be called "Album of an admirer of Detaille." But the steely, hard, die-sinker's touch of Detaille (of course there are specimens in the exhibition, for to what display do the fond possessors of Detaille's intelligent manikins omit to send their darlings?) is mistranslated by his ambitious pupil. Detaille himself, though there are those up and down in the painting world we love better, never loses breadth; every facet in his clear modelling is cut with reference to the whole picture from marge to marge. In these pictures of mushiks carousing in a birth-day carriage-ride, of smugglers galloping away from the Neva which their pursuers are just crossing, the little details are all struggling to be admired; and though individual faces of capital expression are to be found, the painting suffers by being conceived in twenty different focuses. Among the entirely foreign guests of the society, Mr. Killingworth Johnson, a pretty regular annual attender, comes forward with a tall study of a girl trying on a wedding or engagement ring, and looking at it with near-sighted intentness. The picture is unpleasing. We do not mean that it is unpleasing from the fact of the girl not being beautiful. But it is shocking from the want of any consistent motive covering the whole picture as a work of art. It is entirely disjointed—the region of the knees being one picture, the region of the elbows another picture, the region of the head another, and so on—the whole work of disintegration assisted by a modern piebald costume of the worst type. Mr. Johnson, who sent us one good painting years ago, is evidently waiting to see whether we can stand a long series of his peccadilloes. Pictures from dealers or purchasers of foreign work are scattered through the Academy, and are certainly useful as hints in manipulation. Thus, the specimen of Lucio Rossi, "A Chance Meeting" (9), although greatly maligned by the "serious" artists, teaches a decorator just how to make a bright sunshiny patch on a panelled wall, with a collection of butterfly colors put together in the style of Watteau and the fan-painters. Tofano's "Reverie" (252) is an excellent example of the ease with which the successors of Fortuny seem to arrive at the most sparkling delivery of the color possible or conceivable. "The Ballet" (233), by Degas, is, from its own point of view, a truly wonderful work. It is an "impressionist" picture of the family founded by Courbet and Manet. The artist is said to spend his life behind the scenes of theatres, watching the queer second-nature, the oddly distorted habits, of dancing girls. The cheerful pain with which they will stump around in a half-circle on the nibs or stubs of their poor feet—the way in which they catch their balance in their deep obeisances, with rectangular leverage of a bony arm—the soft crash with which their skirts collapse after a whirl—these are the objects of M. Degas' most serious study. From the copy before us this old frequenter seems to have kept his eye as fresh, his humor-sense as lively, as Margaret Fuller's in the presence of Ellsler, or Carlyle's, when introduced once to the study of saucer-skirts and compass-legs. The girl stooping to fasten a sandal (or is she rubbing her ankle after the ordeal of practice?), with her short draperies enclosing her like a poppy-flower; the girl who lifts her arms, exerts her club-feet, and executes a stumping transit over the stage, are perfect in their way; and so is the conscientious old ballet-master in fustian, and so is the brutal-looking manager in broadcloth. This picture is in gouache, and seems to represent best in that material the dusty look of the coulisses. The faded monotony of a rehearsal proves to have fresh life in it for an art-specialty, as M. Degas uses it.

Pictures of a modest respectability abound. "In a Tide Harbor" (31), by Bricher, is a clever study of a wharf, slimy with the ooze of low tide, and painted with knowing but commonplace touch. Kappes shows a fishing-scene (155) with the title mistranslated, as usual, from Hugo's *Travailleurs de la Mer*, where the first word should be rendered "cultivators" rather than "toilers." The picture forms a spirited twilight marine, but the figures show the peril of the newspaper-designer's hasty habits in giving a kind of theatrical show of graphic movement, instead of live movement copied instantly from nature. His "Immortelles" (440) and "November" (397) are likewise good in scenery and superficial in human action. Shelton's "Suburbs" (439) extract a sort of poetry from the sparse street-lamps and detached villas of the outer boulevards, looking lonely, as such regions ever do, with a suggestion of the warm homes of a city street having been suddenly and unsociably picked apart, and held like pawns in distant chessboard corners, while the central movement of the game goes on without them. "Looking Seaward" (189) is a very able coast-scene in gouache, by Mr. Hopkinson Smith, better known for his sylvan effects; it is a clear, positive statement, with something salt in the landscape and a sort of ringing vibration in the air. No. 513, by the same, is a clever drawing-master's lesson in light and shade, very knowing in its epigrammatic relief of a perfectly black tree against a perfectly white tree. The Landscape No. 13, signed at Milan by M. Gignoux, is a similar piece of sunshiny intensity translated into color. "Becalmed" (373), by Farrer, is very happy in giving the wetness of water, as asserted when the penetration of noon-sunshine makes the blue element seem almost immaterial; his larger "November Day" (99) is also successful. Sartain, in a perfectly literal, and at first view prosy, Venice street (16), gets some precious tones on his weather-beaten plaster that are not to be had by any of the methods that teachers teach, and partake of the magical. Walter Paris, in his "Lenox Furnace" (150), gives honest work without sensationalism, and shows the hot, withered look of a village of iron-works superheating the landscape of the high summer noon. Nicoll's "Portland Harbor" (52) shows us good hard rock and an intelligent movement of overlapping waves towards the shore. The "Calm" of P. T. Clays, the Belgian (44), is, of course, a faultless recital of the liquid effects of plashing water-music. Ciceri's "Passing Storm" and "Fishing" (119, 122) are hasty little studies that it is not too much to call masterly. Bourgoin's studio interiors—Berne-Bellecour's (144) and Vibert's (148)—are painfully minute, without felicity. "A New Hampshire Kitchen" (253), by Mrs. Walter Brown, showing a huge fireplace that would be the pride of a modern bric-a-brac interior, and a farmer's wife manipulating the kettle of dye-stuff obtained from blue sugar-loaf paper, reveals a care and a promise rare among our lady-amateurs.

A room is devoted to black and white. The display is very select. Here are the sketches by Detaille, the pen-drawing by Jacquemart, the design by Leech, the crayon by Knaus, the etchings by Whistler. Here is a superb proof of Seymour Haden's "Calais Pier," much better than that he exhibited at the Centennial, and a preliminary proof of a corner of the same. The etchings by Mr. Farrer are surprisingly good; some of those by P. Moran, of more difficult subjects than Mr. Farrer's, artistic and capable. Mr. C. H. Miller, when etching, is driven to a definiteness of touch not characteristic of his painting, without by such definiteness expressing any particular truths of nature. The woodcuts out of *Scribner's Magazine* are nearly all capital, proving that this nursery of our engravers really has a mission. Mr. Henry Marsh, with three wood engravings after La Farge, and some of his entomological subjects, asserts once more his unprecedented care, delicacy, and sense of color. To the exhibition in black and white may be added the illustrations of the catalogue, of which we must say that they are entirely too commonplace. They do not look like artists' tentatives, and do not keep the keen life of artists' thoughts.

The Nation.

NEW YORK, THURSDAY, MARCH 7, 1878.

The Week.

THE President returned the Silver Bill to the House on Thursday unsigned, with his objections. These were, that the silver dollar authorized by the bill is worth from 8 to 10 per cent. less than it purports to be worth, and "is made a legal tender for debts contracted when the law did not recognize such coins as lawful money"; that by being made receivable for duties it will in time put an end to the gold revenue of the Government, "and thus compel payment of silver for both the principal and interest of the public debt"; that of the bonded debt $1,143,493,400 now outstanding was issued prior to February, 1873, when the silver dollar was unknown in circulation, and only served as a convenient form of bullion for exportation; that $583,440,350 of the funded debt has been issued since that date, "when gold alone was the coin for which the bonds were sold, and gold alone was the coin in which both parties to the contract understood that the bonds would be paid"; that silver being at the time greatly depreciated in the markets of the world, no one would have taken the bonds if made payable in silver; that $225,000,000 of them have been sold during the present Administration for gold coin, with the advantage of a corresponding reduction of the interest on the national debt to four per cent.; that in the progress of these sales the public doubt lest the bonds might be paid in silver was quieted by the authorized statement that such payment could never be sanctioned by Congress or by any department of the Government; and that "in view of these facts it will justly be regarded as a grave breach of the public faith to undertake to pay these bonds, principal or interest, in silver coin worth in the market less than the coin received for them." The message then notices the expectation that the silver dollar will be brought to a par with the gold, and points out the absence of any provision, in case of the opposite contingency, for exempting pre-existing debts from the operation of the bill. On the other hand, a deliberate design to pay off old debts in depreciated silver will receive the reprobation of mankind. "The silver dollar should be made a legal tender only at its market value. The standard of value should not be changed without the consent of both parties to the contract. National promises should be kept with unflinching fidelity." The President concludes by declaring that he cannot approve a bill which, in his judgment, "authorizes the violation of sacred obligations"; and that a false currency "will in the end defraud not only creditors, but all who are engaged in legitimate business, and none more surely than those who are dependent on their daily labor for their daily bread."

The "further consideration of the bill" for which the message entreated was contemptuously refused by Congress. The Republicans who lately viewed with unspeakable horror the return of Confederate brigadiers to the House, promptly rallied to the support of the Vice-President of the Confederacy when he moved that the bill be passed over the veto. The one hour which Mr. Stephens granted for debate—the only debate which the House has had directly upon the bill—was consumed in incoherent five-minute ejaculations rather than speeches, and the vote showed 196 for and 72 against the measure. Without delay the Senate followed in the footsteps of the House. The message was not so much as ordered to be printed or referred to the customary committee, nor did the great statesman from New York manifest the smallest desire to protest or to argue the general question. The vote stood 46 for to 19 against the bill, the only significant incident being the somersault of Senator Hill, of Georgia, who meekly joined the throng of repudiationists, as if some recent glittering generalities of his, on teaching the rising generation to be honest, had been misconstrued by those who expected him to set the example.

The Senate and the House have also flagrantly disregarded the wishes of the Administration by passing a bill which authorizes the United States Circuit Court for the Southern District of Mississippi to hold a special session at Scranton, in Jackson County. This is a deliberate obstruction of Secretary Schurz's endeavors to put an end to the systematic and long-established practice of stripping the public lands of timber in the interest of private adventurers. He has been so far successful that the aid of Government (*i.e.*, Congress) has been invoked against the Government (*i.e.*, the Executive), and the bill in question aims to secure trials in the heart of the lumber districts, where the lumber rings can furnish juries, public sentiment, and all other influences adverse to the course of justice. Mr. Blaine improved the opportunity to vent his spite on the Administration. He was, on another occasion, reinforced by Mr. Conkling, when the bill to provide a temporary substitute for the pension agent at New York came up. Col. Frank Howe had been removed, and his successor had not yet been able to secure the required bonds. This made cutting allusions to civil-service reform in order; but the bill passed all the same, since giving offence to pensioners is not a sin that the average Congressman will be guilty of. On Wednesday week the House passed a bill authorizing a review of the court-martial of Surgeon-General Hammond in the early days of the war; on Thursday, a bill compelling Naval estimates to be made in detail; on Monday, the Senate bill ordering pensions for fourteen-day service in the war of 1812, with restoration to the rolls (without back pay) of those stricken off for disloyalty during the rebellion; and on Tuesday, a bill paving the way for the final disposition of the Chinese Indemnity Fund. The Senate has confirmed Mr. Bayard Taylor's appointment as Minister to Germany.

The President's share in the silver legislation has been so manly and courageous at the close that it will go far to atone for his previous reticence, in the eyes of those who have been troubled by his not having offered some active opposition to the craze in its earlier stages. The message, too, is wisely confined to points on which there can be absolutely no difference of opinion among honest men, and which can only be met by the fable about the fraudulent demonetization. If he had taken up the economical objections to the bill in detail, he would have obscured the issue in the eyes of all that portion of the public which must be relied on hereafter to chain up the devil of knavery, which now seems to have been let loose upon the country. We have no doubt the message will do much to sustain the price of American securities abroad, by leading people to believe that the sober second thought of the country will be with him. He has resisted so much temptation on this point, and has met the opinion even of his own State with so much firmness, that it makes one wonder the more that in the work of civil-service reform he has not been able "to put his foot down" with greater firmness.

As to the probable financial consequences of the Silver Bill they will hardly be visible for a year. The largest amount of silver coin which can be put into circulation within that period is $48,000,000, but this will produce little effect on the circulation, as it will keep rolling in and out of the Treasury for customs duties. We believe the measure has not received the support or approval of a single person whose opinion on matters of finance has ever had any repute, or of many who had ever given finance any attention until they began to clamor for silver. Nine-tenths at least of those who are prominent in its advocacy are in embarrassed circumstances, or laden with some speculative commodity, so that their support of it resembles the

bellowing of a mired ox rather than the arguments of an economist. Indeed, the all but certainty with which, when one enquires into the private affairs of a noisy silver-man, one comes on unsalable real estate, or unprofitable stocks or mines, has for some time been one of the Washington jokes. The effect on the relation of gold and greenbacks has been thus far rather to approximate them, and, indeed, the prospective release of gold from the work of duty-paying will probably help to keep it down. As to the price of silver, which has declined in London, the silver-men are likely to chuckle whichever way it goes. If it falls, it will *pro tanto* increase the advantage over their creditors given them by the bill; if it rises, it will justify one of their prophecies that remonetization would raise it to par. At present they are filled all over the country with a kind of drunken joy, which is stimulated by the usual "falling into line" of a good many anti-silver papers, in obedience to the popular will.

The Barbour Tax Bill, just vetoed by Governor Holliday of Virginia, provides a tax-rate of fifty cents on each one hundred dollars of taxable property; of this, ten cents is set aside for the public schools, twenty-five cents for the support of the government, and fifteen cents for the interest on the debt and other purposes. This last tax is made payable in coupons, all the rest in money, although the coupons are, of course, in the hands of the creditors of the State, and although it is declared on their face that "they shall be received in payment of all State taxes and other public dues." This bill the Governor pronounces "both unjust and unconstitutional," all attempts to take away the receivability of the coupons for taxes having been pronounced by the courts unconstitutional and void. One of the most specious grounds on which the passage of the Barbour bill was urged was the sacredness of the public schools, but the Governor insists in very strong language that "a State has no more right to educate its youths, than an individual his children, at the expense of creditors." He points out that education at such a cost would not be worth having, and appeals to the Legislature not to taint the school system of the State with repudiation. The veto was unexpected, and its sentiments were not agreeable to the "readjusters," who tried to prevent its being read. The Speaker of the House, however, decided that the minority had a right to insist on this being done. A caucus of the "readjusters" was therefore held, at which a committee was appointed and some pathetic speeches made; one senator taking the ground that the message would "convey to the people more of sadness, sorrow, and disappointment than anything that had happened since their flag went down at Appomattox Courthouse," while another declared that the veto, if sustained, sounded "the death-knell of the Conservative party in Virginia." The Governor, however, has been sustained in the House by a vote of 71 to 42.

The South Carolina frauds have almost ceased to attract attention outside the State; but another report has been made by the "Fraud Committee" on the corrupt expenditures for printing, which is a curiosity in its way. It contains the private diary of Josephus Woodruff, the Clerk of the Senate elected in 1868, through whom the fraudulent payments under this head were made. The frauds were enormous in extent—the amount paid from 1868 to 1876 for printing being $1,326,589, a sum greater than the printing-bills of the State (including those paid during the war in Confederate currency) from the establishment of the State Government down to 1868—and brazen in character, as may be inferred from the fact that "a piano for McKinney" appears as one item. Woodruff seems to have been a pious thief, and his diary is mainly interesting as an unreserved exhibition of this type of character, so frequently found among "statesmen" just now. From what he says the depredations in which he was engaged do not seem to have struck him as particularly bad, because he regarded them as part of "politics" as usually carried on. He considers the robbery merely as a subject for levity, remarking that "Printers are the light of the world, and should be taken care of as preferred creditors"; and, in expressing the hope that he may get the office of State Treasurer, records an intention in that event to "begin studying finance in earnest." This light humor does not interfere in the least with his piety, and he seems to have carefully avoided through all his straits the vice of profanity. "God grant," he exclaims, "that I may be saved from swearing!" One singular entry in his diary is an expression of regret (this is the only thing which he admits regretting) on account of a payment of $10,000 to "Chamberlain." Who can this be?

The machinery of the fraud is curiously like that of the Tweed Ring in getting up the famous "New York Printing Co.," in which the municipal thieves were stockholders, and plundered the Treasury in printing-bills. The "Carolina Printing Co." was organized in like manner in 1870, the leading members of the ring, including Scott, Parker, and D. H. Chamberlain, being the chief stockholders, and as usual they owned two newspapers, and then went to work. Woodruff's diary tells the rest of the story. On one occasion the thieves seem to have fallen out, but (Jan. 12) Chamberlain brought about a reconciliation "in a very nice way." Jones and Woodruff then "called on Governor Moses about effecting a settlement." "It was a hard day for Sunday," adds the pious rascal, "and I trust God will forgive us for our actions, as we could not help it."

One of the colored jurors who sat on the Anderson trial has written to the papers confirming the story that he and the other colored juror were deceived as to the effect of their recommendation to mercy, and declares, while claiming credit for considerable intelligence, as having been born and bred free and having received a good school education, that had they known that a verdict of guilty would send Anderson to the penitentiary in spite of the recommendation, they never would have found it. In other words, they thought him guilty, but did not think he deserved the penitentiary. He also says that one of the deputy-sheriffs conversed freely in their room at night with one of the jurors, but does not say on what subject. The story that the jury was "packed to convict" he disposes of by showing that three jurors from the beginning held out for acquittal. We believe there is no doubt that Anderson is to be pardoned, but we trust Governor Nicholls will not pardon him to go back to the Custom-house. He ought to agree to quit public life before being released.

Cuban sympathizers have received a severe blow in the announcement of a general capitulation of the insurgents and an amnesty by the Spanish Government. The official announcement has been made in the Spanish Cortes of the surrender of the Cuban Central Committee, the Executive, and the principal chiefs of the insurrection. All the troops actually under arms appear to have laid them down, in accordance with an agreement previously arrived at, last Saturday. The facts relating to the surrender confirm the view which we have from time to time expressed in these columns as to the extremely slender military basis on which Cuban belligerency has always rested. The total number of "troops" mentioned in the despatches as having come in are three thousand, and that these were anything more than guerillas does not appear. The principal terms of the peace, which has been effected by the labors of General Campos and Captain-General Jovellar, as published, are as follows: Political rights for Cuba identical with those enjoyed by Porto Rico; general amnesty for offences since 1868; freedom to the insurgent slaves and coolies; safe conduct and transportation for any insurgent wishing to leave the island. There are said to be, besides these, secret agreements providing for a civil governor, with duties distinct from those of the military governor; a provincial parliament in each of the three departments; popular elections for municipal officers; the inclusion of the war debt in the public estimates of the island; the dissolution of the volunteer corps of Havana, and the organization

of a new militia, to be composed alike of Cubans and Spaniards; a representation of the island in the Cortes; a recognition of the military rank of the insurgent chiefs and officers, and those accredited with foreign commissions, their rank "to be effective only in the list of the Spanish army in Cuba"; and the complete abolition of slavery in five years, with indemnity.

The news of this peace found the New York branch of the Cuban government actively engaged in carrying on the insurrection in Exchange Place and Broad Street, as well as at Washington. Señor Echeverria, the diplomatic agent, was at the time advocating the recognition of belligerent rights among members of Congress; but he hastened to the seat of government, at No. 35 Broadway, where an anxious band of patriots were gathered to meet Brigadier Gonzales, fresh from Cuba, with important despatches. From his credentials it appears that the brigadier had been furnished the means of transportation by the Spanish general-in-chief, and that on February 8 the Chamber of Representatives "in the State of Camaguay" had been dissolved, the Presidency of the Republic "consequently abolished," and the powers delegated to the members "taken back" by the people and delegated by them to a new committee, headed by Colonel Juan Spoturno. On receipt of these credentials the Cuban agents in New York incontinently resigned. It is a black business, and it is only natural that the sudden collapse of the insurrection should be attributed in some quarters to the liberal use of "Spanish gold."

The events of the week which most concerned the London and New York financial markets were the conclusion of the treaty of peace between Russia and Turkey, and the enactment of the Bland Silver Bill, as amended by the Senate, over the veto of the President. The first caused a buoyant market for securities in London, consols advancing ⅛ to 1 per cent. from the recent low prices; the effect here was to depress breadstuffs and provisions, but, strange as it may read, the stocks of railroads which would be most benefited by a lively export trade, such as an extension of the war would give, advanced. As to the effects of the Silver Bill, the price of silver in London when it became a law was 55⅛*d.* per ounce; from this it has declined to 54⅛*d.* per ounce. United States bonds in London at first declined ¼ to ½, but afterwards advanced 1 to 1½ per cent., and through all these fluctuations ruled enough below New York prices to make it profitable to buy them on that side and sell them on this. Gold fell from 101⅞ to 101¼, a movement which facilitated bond importations. Bills on London advanced ½ a cent to 4.84 and 4.86½. The decline in gold was wholly on account of considerations of supply and demand, and the absence of any disposition to speculate on the future effects on gold of silver remonetization. The bullion value of the 412½-grain silver dollar at the close of the week was $0.9106 gold, while the United States legal-tender note which will be paid with this dollar was $0.9864.

The Grand Duke Nicholas, in command of the Russian army in Turkey, has at last officially announced that the treaty of peace has been concluded, and its terms are now as fully known as they will be known until the text reaches St. Petersburg by courier—that is to say, in about ten days hence. To what the length of the negotiations has been due it is hard to say, as the Turks had no choice but to sign whatever was drawn up for them; but it looks as if the delay and the occasional revelation of enormous Russian demands were a sort of experiment on European opinion, so that the final abatement in the terms should wear the look of concession and pacify England and Austria. Bulgaria is to be, as heretofore announced, a tributary principality, but it is not to include Adrianople or Salonica, and the prince is not to belong to any European reigning house. It is to have the port of Kavala on the Ægean, and Varna and Burgas. All the Turkish fortresses north of the Balkans are to be razed and the troops withdrawn. Russia abandons her claim to the Egyptian and Bulgarian tribute, which probably was only made to be abandoned. The rest is much what was first announced. The troops are to go home by sea. It appears, also, by a solemn denial from Bismarck in the German Parliament, that the march to the defences of Constantinople was not stolen by means of delay in signing the armistice, but was provided for by the armistice itself. The question of the Dardanelles is reserved for future settlement.

The text of Prince Bismarck's speech on the Eastern complication, in reply to Herr von Benningsen's interpellation, has come out by the last mail, and is very interesting for the light it throws on the situation as the close of the war leaves it. He looks at it from first to last as it affects German interests, but gives his opinion somewhat freely as to its bearing on those of Austria and Russia. Turkey evidently no longer counts for anything in his eyes, and he begins by mentioning as the capital fact that Russia occupies Turkey from the Danube to the gates of Constantinople. The indemnity for the war, he says, is the affair of the belligerents. About the independence of Montenegro, Servia, and Rumania he does not care much. About the Dardanelles and the Danube, he will insist on freedom of navigation; he does not think that the passage of vessels of war has any more importance than the passage of merchant vessels, and believes that both will be settled, Russia consenting, in the spirit of the Treaty of Paris. He feels sure that Russia will see that her interest lies now in settling the Eastern Question so satisfactorily to England and Austria as to prevent all danger of a speedy renewal of trouble; and he maintains that, on the other hand, if Austria and England undertook to drive Russia out of Bulgaria, and succeeded, they would find themselves saddled with that very responsibility for the Christian population which Russia is now endeavoring to meet, and which they would have to meet on the line traced out by the Conference. He concludes, therefore, that nobody wishes to fight, and that there will be no fight, and believes there will be another, but this time successful, conference. As to Germany, anybody who supposes she is going to war to make herself the arbiter of Europe, Napoleonic fashion, or for any purpose except the protection of internal unity or in defence of interests so plain that in defending them the Government would be supported by the unanimous vote of the Federal Parliament and by the deep conviction and enthusiasm of the German nation, is greatly mistaken. He adds that Germany is in the best possible relations with Austria, England, and Russia, and, in fact, talks as if the world looked very bright and smiling in every direction.

In England something like calm has been restored, but everybody must by this time begin to feel somewhat foolish. The leaders of the Opposition, the Marquis of Hartington and Mr. Forster, left the House in order to avoid voting for the £6,000,000, and, in fact, the Liberals have apparently laid down their arms, fearing that their further preaching of peace would increase the popular excitement and precipitate war. But the danger of war really disappeared after the first mad day, and the public finds consolation in the reflection that, though the Russians really command Constantinople, they have not entered it. There has, indeed, never been any reason to suppose that Russia meant to touch any of the "interests" which Lord Derby defined, at the beginning of hostilities, as British. Moreover the situation is greatly complicated by the all but certainty that Turkey has gone into alliance with Russia, and cares nothing for England any more, so that it would be impossible now, if war was entered on, to say what it was for or when it would end. The £6,000,000 has been all spent, and military preparations continue with unabated vigor, and the House has voted 135,452 men for the army for the coming year, which Mr. Hardy called a peace footing. About 35,000 men, ready for foreign service, are shortly to be assembled in camp, which must, as a threat, amuse the Russian staff.

THE INCOME-TAX AND THE SILVER AGITATORS.

A PETITION against the bill, now before the House, reviving the income-tax has been numerously signed in this city, and in Baltimore, Philadelphia, and Boston. It sets forth, as the leading objections to the tax, that it is impolitic, as a tax on industry and thrift; that it is unjust, as a tax on the industry and savings of the individual, which does not, like other taxes, diffuse itself through the community by entering into prices under the laws of trade; that it cannot be collected fairly because its apportionment has to be left largely to the conscience of the taxpayer, so that the unscrupulous escape it and the honest bear the burden; that when first imposed it was only collected from 275,000 persons, and when the exemption was raised to $2,000, it was only collected from 115,000 in a population of 40,000,000; that, finally, it is, in the opinion of eminent lawyers, unconstitutional, under Art. I., Sec. 9, which provides, as a protection against the fiscal oppression of one portion of the Union at the expense of another, that "no capitation or other direct tax shall be laid unless in proportion to the census or enumeration heretofore directed to be taken." It will, therefore, be resisted, and most likely with success, before the Supreme Court. We confess we rely on this appeal to the courts to defeat it rather than on this or any other petition to the present Congress. The arguments of the petition are unanswerable, and they are the kind of arguments against a tax which ought to have most weight with a civilized legislature, for the sole object of a civilized legislature in levying any tax ought to be the raising of the needful amount of revenue with the least possible amount of vexation or inconvenience to taxpayers of all classes and conditions, and the most equitable possible distribution of the burden among taxpayers of all classes and conditions. Into nothing is it less proper to allow passion or prejudice of any kind to enter than into the levying of taxes; in no way can the seeds of ineradicable social hates and dissensions be so readily sown as by making taxation the expression of hostility of any kind, or by imposing it in the interest of any class or section of the community. The legislator levying a tax ought, in fact, to sympathize with the feelings of every honest man, whether rich or poor, who is to be called upon to pay it.

But there has since 1860 been a good deal of departure from these sound rules. The tariff which was imposed after the war broke out, however good the intentions of its framers may have been, very speedily began to be administered in a spirit of hostility to all persons engaged in foreign trade, and was finally successful in bringing foreign trade into a kind of disrepute and presenting foreign importers to the public as presumptive smugglers and enemies of the Government. The moiety legislation and the appearance on the scene of detectives like Jayne with his handcuffs were the natural result of the growth of this policy, and a decided approximation to the taxing system of Oriental monarchies, in which the taxpayer is treated as the prey of the collector, to be hunted down and, when caught, tortured if necessary. The United States Custom-house ought, in the proper order of political development, to be that in which the greatest care is taken to shield the honest taxpayer from inconvenience. For some years after the war, however, it stood in this respect in the rear rank among those of other civilized nations.

With the rage for city and town improvements, and the consequent great increase of local taxation, which followed closely on the war, there arose that eagerness to throw the weight of municipal burdens on the rich or well-to-do, and that vexatious spirit in trying to gratify it which is still at this moment perhaps the most formidable fact in the problem of municipal government. There is hardly a city in the country, and particularly at the East, in which the taxing and assessing power is not lodged in the hands of men possessing but little property themselves and representing those who possess none; and they have done a good deal to erect the owners of houses and lots, and especially the owners of large lots, into a class possessing interests separate from those of the community, who ought to be made to bear not a fair share of the public burdens, but as large a share as possible, and be well vexed in the process. Everything lawful is therefore done to harass them and make the possession of visible property seem onerous and shameful. The system has reached its climax in Boston, where the houses of rich men have been watched by detectives so as to catch them as residents on the first of May, the assessing day, and thus abridge their right of escaping heavy taxation by having a domicile elsewhere, and produce the impression among poor and ignorant voters that it is the rich who ought to contribute mainly to the city expenses, and that they were knavish in trying to get away. In other cases, again, assessors have sought to give expression to the popular dislike of large places within city limits by high valuations even of land not offered for sale, or for which there may be no sale, but which *might* be cut into small lots, as if there was something criminal or anti-social in the luxury of having a large garden round one's house, or as if it was proper to carry out in administration views of public policy which have not been expressed in legislation. But municipal government ought to be so administered as to attract wealth and not to repel it, and ease in escaping municipal taxation by residence elsewhere ought to be encouraged as the very best check on the excesses and extravagance of the class who now administer municipal affairs. In this way cities would begin to compete for population and capital, not simply in boulevards and asphalt pavements, but in low taxation and administrative courtesy and efficiency.

Last of all, the present silver agitation has produced among the farmers and laborers of a large portion of the country hostile feelings towards bankers, merchants, and all that class of persons who do the business of exchange, and this has more than anything else caused the attempt to revive the income-tax. That is to say, it is not really offered as a good way of raising a certain amount of revenue, but as a good way of harassing an obnoxious class residing mainly in a particular region, and therefore has something of the character of a bill of pains and penalties. The arguments used against it in the petition have, therefore, the fatal defect of pointing out as an objection to the bill the probability that it will produce the very results at which its promoters are aiming. They seek to punish the "gold-bugs" and the Money Power for opposing the remonetization of silver and for expecting interest on their loans, and, if the bill does this, will not be troubled by its discouraging thrift, or its working injustice in the sense in which the petitioners use the term, or by the impossibility of its fair collection. It is in giving strength and even fierceness to this class-hatred that the silver agitation has done most mischief. The Silver Bill can be repealed, or its evils neutralized, but the delusions which have been propagated in advocating it will remain and furnish the soil in which many other legislative follies may grow. In fact, the probabilities at this moment seem to be that the propriety of giving accumulations of capital proper legal protection, or of not discouraging them by hostile legislation and unequal taxation, will be the next party question in our politics. A more unfortunate one could hardly come up in a democratic country, for it is one which more than any other infuses bitterness into party strife.

The notion that bankers and merchants and manufacturers have interests apart from those of the rest of the community, or get more advantage out of a stable standard of value than a workingman, is, of course, a deplorable hallucination, and the silver agitators who have spread it are either knavish or demented. The real "Wall-Street speculators," against whom the West is so much roused, will probably make more out of a fluctuating standard than any other class of men; but they are only a very small proportion of the moneyed class. This, as a whole, is created by and thrives on the general prosperity, and is necessary to the general prosperity, and lives and has to live by honest courses. That the machinery of credit and exchange can in any country be successfully managed by rogues and gamblers is a ludicrous mistake. Nearly every speech and article produced in support of the Silver Bill has, indeed, been largely made up of denunciations of the very class on whose skill, judgment,

and integrity the prosperity of the community depends, and to whose boldness the material progress of the United States has been due. If these ravings should result in a permanent condition of popular feeling calculated to make capital timid, and substitute hoarding or foreign loans for investment at home, it would not only check the growth of the country but change greatly for the worse the character of American society. To discourage hatreds and jealousies, and get rid of the delusion that a man can remain rich among us without employing his wealth in useful production, ought to be the first object with every one who has any influence with the masses. We wish there was some way of punishing those—wretches is the proper name for them—who, during the past year, have been poisoning their minds with the dregs of European Communism as a means of attacking the national credit.

THE WAR POWER OF ENGLAND.

THE history of the war crisis in England, even in the incoherent shape in which it reaches us through the mails and the telegraph, is an exceedingly interesting study in English politics. Nothing could well be worse than the blunders of the Ministry, except the blunders of the Opposition, and yet both have the same source, and that source is the desire of the country to hold her old influence in Continental politics without adopting Continental methods of creating and retaining influence. That is to say, the great reason, and in fact the controlling one, for not going to war with Russia is the want of an army, and this same reason has, since 1848, caused a steady decline in the weight of Great Britain in European politics. The Crimean war was measurably successful—that is, it brought Russia to her knees and postponed the overthrow of the Turks for twenty years—but it also dissipated completely the prestige of Waterloo, and revealed the inability of wooden fleets to hold their own any longer against shore batteries armed with modern artillery. Not only did it bring to light the defects of England's military organization, but it proved that she could not readily, with the volunteer system, raise a second army, small as the first was. The recruits which were sent out to fill the ranks in 1854–5 were notoriously so young and "weedy" that nobody thought with either pride or comfort of the force which would have attempted to carry on the war if the peace negotiations had not been successful. Luckily, Russia had been exhausted in an attempt to defend without railroads a point on a remote frontier, so that the Allies were able to go home with the air of victors, and having substantially accomplished their object; but the result was none the less injurious to English influence. France bore away most of the honors of the fray, and in England the first feeling of pride at English valor, as displayed in the war, was succeeded by a humiliating sense of having been "sold" by the French Emperor.

The full extent of England's incapacity to maintain her place in Continental councils was not, however, made plain until 1866, when the success of the Prussian military system astonished the world and caused what may be called the impressment of all able-bodied men on the Continent for military service. The semi-consciousness of this in English military circles caused that outbreak of hostility to Prussia which was nearly as striking during the Franco-Prussian war as the present hostility to Russia, and led to the sort of mild panic which followed the publication of the 'Battle of Dorking.' In fact, the alternative was then plainly presented and fully recognized that she must either confine herself to a rôle like that of Holland—the rôle of a peaceful trader—able, it is true, to defend vigorously all she has got, but not anxious for anything more, or else raise a standing army adequate to her pretensions by the conscription; a measure which, even if submitted to by the people, would involve very radical social and political changes, and might, indeed, change greatly the distribution of power. It is the unwillingness either to abate these pretensions or raise the army which led to such humiliating situations as that which preceded the Treaty of London and followed the refusal of Russia to abide by the restrictions of the Treaty of Paris on her naval force in the Black Sea, and that through which Great Britain is now passing. The resource of subsidizing Continental allies, which was freely resorted to in the last French war, is no longer open. Continental powers are not so willing to be paid for fighting, and in the present condition of English opinion no Ministry would dare to resort to it. Moreover, the improvement in the condition of the laboring class, valuable as it is in other ways, has rendered recruiting exceedingly difficult, in spite of all that has been done to make the soldier's life attractive as regards pay, quarters, and discipline. Ireland, too, was during the Napoleonic wars a great nursery of recruits. The population was large and increasing, and the peasantry were very poor, ignorant, and light-hearted, and untroubled by the political cares and ambitions which they have since the Catholic Emancipation taken on themselves. The army which exists is highly equipped and well officered, but even the showy account given of it by Sir Garnet Wolseley in the last number of the *Nineteenth Century* only produces 40,000 men ready for active foreign service; and of his total of 400,000, 180,000 are volunteers—that is, armed shopkeepers, lawyers, and doctors who occasionally parade. The proposal to draw on the Indian army for a European contest of serious proportions is one which can hardly be entertained in England, and which would not be considered as worthy of attention in India, though India would doubtless furnish a fine recruiting ground for an army to be used against Russia two or three years hence. But in our time armies which have still to be raised do not count, and, indeed, it may be said neither do armies which are not ready to march. The Germans keep even their wagons packed in time of profound peace. No army counts for one of our great wars of to-day which cannot spare 25,000 to 30,000 to be killed and wounded and missing for the first engagement; or, in other words, the total force with which Great Britain is threatening Russia.

The great danger of this state of things to England—and the increased sobriety of the ministers within the last week or two seems to indicate that they appreciate it—is that the irritation produced by the continued and growing disregard of her threats on the Continent may some fine day plunge her into a war, under the influence of intense popular excitement, in which she would undergo tremendous loss and humiliation before she recovered her senses. There has in the present case been a narrow escape from this. The false rumor that the Russians had occupied Constantinople threw London for a whole day into a state of frenzy, disorganized the Opposition in the House of Commons, and caused the prompt despatch of the fleet to the Sea of Marmora. It is now, however, acknowledged on all hands that had it not been for Russian moderation and timidity the result might have been in the highest degree disastrous; for, had the Russians been bent on fighting, and continued their advance on Gallipoli, and occupied the Turkish forts, the fleet would have been caught in a trap.

What is worse than all is that the political influence which is lost, and which might be called well lost, through the reluctance of the country to encounter the perils and burdens of a large standing army, is not replaced by moral influence. Friendship with foreign states and races is either not cultivated by the Government and the press or not cultivated opportunely—that is, not until it has through some turn in the wheel of fortune become valueless. Nearly every state or race in the world which has ever been in difficulties of any kind during the last fifty years has had reason to accuse England either of treachery or hostility. Her cordial sympathy appears to be reserved for the victors in bloody struggles. In the present imbroglio the shocking massacres in Bulgaria were when the news reached England made a joke of by the Prime Minister, and the Ambassador at Constantinople made the atrocious statement in a published despatch that the Turkish habit of massacring 20,000 or 30,000 persons at a time was of no consequence if the maintenance of their rule was necessary to the protection of "British interests." Through the whole contest, too, both the Government and its organs in the press pursued a course of nagging hostility to all the races engaged in the crusade against the Turks. Russians, Rumanians, Servians, Montenegrins, and Bulgarians were all reviled and ridi-

culed with unswerving persistence and impartiality. They have succeeded, and now look on England as an enemy and Russia as a deliverer, and Southeastern Europe is in their hands, and they are entering, we have no doubt, on a great career of prosperity. Unfortunately, too, that horror of bloodshed which shows itself so strongly in British opinion about other people's wars vanishes, when "British interests" are in the smallest degree imperilled, with a rapidity which fills the world with mingled amusement and disgust. The English press has at one time or another during the last eighteen years been filled with lamentations over the sanguinary propensities of Americans, Germans, and Italians, and Russians, Servians, and Montenegrins, and lamentations apparently so sincere that many people were ready to believe that the British public had come to the conclusion that war was too horrid a thing to be undertaken for anything but national existence. There is something more than surprise, therefore, when they hear that if the Russians enter Constantinople there is not a man in England who would not wade knee-deep in blood in order to drive them out, and perceive that along with immense warlike fervor there exists at this moment no agreement as to the objects of war with Russia; so that it seems sometimes to the scoffers as if the most peaceable, long-suffering, and humane people in the world were going to fight the Czar in order to let him know they did not like or trust him, and did not care a snap for him.

AFTER ONE YEAR OF PRESIDENT HAYES.

WASHINGTON, March 2, 1878.

THE passage of the Silver Bill over the veto had so long been felt to be certain that when it occurred it can hardly be said to have had much financial interest. That the majority was so large and the action on the veto so prompt was undoubtedly due in part to the feeling of many of those, in both houses, who were secretly or openly opposed to the bill, that it was not the worst thing that could happen us, and that it was good policy, since its passage was sure, to make it also rapid before the friends of the measure had time to find out to what a small extent it would serve their purpose. It is now acknowledged even by its more rabid advocates that it will not bring immediate prosperity, which will be sad news to the Western debtor, inasmuch as without the free coinage and more mints the supply of silver coin cannot be greatly increased for two years. Moreover there is, as after the passage of the Resumption Act in 1875, considerable uncertainty on both sides as to its effects. There is an absurdity which every one can see in all emotional finance, and if it were left to the emotional financiers to draught and pass their bills they would meet with but little success. But in Congress they usually succeed in frightening the rational men into compromising with them and taking charge of their schemes, and putting provisions into them that will render them harmless. The compromise effected, each party is too much afraid that the other will back out to be willing to submit to any further delay, and the thing, whatever it be, is pushed through so as to "get it out of the way" and enable the legislators to get ready for the fall election. By and by an "indignant, outraged, and deceived people" discovers the folly or humbug of the affair; but the people is soon occupied with something else and forgets it or smiles over it. There must have been some funny finance when the Barbarians first began to take charge of the Roman Fisc, but whether since that time there has been anything in Christendom that can quite equal the way in which some of our Congressmen deal with the delicate problems of trade and taxation, is doubtful. It is difficult as yet to say how the Western supporters of the silver movement will receive the bill when they discover its real nature, but it would be characteristic as well as amusing if they accused the present Congress also of having entered into a conspiracy with "the gold bugs."

In truth, the most interesting thing in the passage of the bill over the veto was the illustration it afforded of the contempt of the majority for the President. Courtesy as well as usage required if not the reference of the message to a committee, at least enough delay to enable the members to read it for themselves and give its contents, at all events, slight consideration. But there was no more respect paid to it than the rules required, and as much scorn heaped on it as they permitted. The performance, too, expressed pretty fairly—as far as I can see or learn—the feeling of the political world here. The President not only has no party, but not even individual supporters. His best friends are mere apologists—and they apologize faintly and coldly. The message was a good one, and stated clearly and strongly not all the objections to the bill, but the principal ones, and the ones most likely to be effective with the thoughtful and intelligent portion of the American people. Yet very few are disposed to concede to it more than the credit of consistency. Most people say that he had to stick to the position of his inaugural. Firmness in holding ground he has once taken few deny him, but there is general complaint that he is greatly wanting in decision, and wavers much and long before taking up any ground at all. The stories one hears in illustration of this are numerous, and there is something melancholy—though to a person of a philosophic turn it has its comic side—in seeing the calm with which they are repeated to you by many who, during the canvass of last year, were vociferous in their guarantees that if there was one thing more than another for which Rutherford B. Hayes was distinguished, it was the clearness of his mind on all great topics, and the rapidity with which he laid out his course with regard to anything he had on hand. There are many reasons for believing, however, that this indecision is often more apparent than real; that is, that he sometimes affects not to have made up his mind long after he has done so, in the belief, as well as one can make out, that in the interval by some course of persuasion or cajolement he will be able to win over or pacify the opponents of what he has resolved on. The result is apt to be, however, that when his final determination is announced, they are able to quote a great many things he has said to them of an obscure or ambiguous character to support the charge of having imposed upon them, or, to use their own favorite phrase, of having "lied to them." The effect of this—whatever construction one may put on it—in diminishing his moral authority one does not need to point out. I might cite many illustrations of it, but one will suffice. I believe there is no doubt that the removal of Simmons was resolved on finally at least a month ago, and yet he was allowed to leave his post and come here to "work" for reappointment for two or three weeks, and lead the whole country to suppose that he was fighting a doubtful battle in the old fashion, with "headquarters" and "lieutenants" and "backers," and to be "weakening" or "gaining strength" from day to day, to the great scandal and discouragement, of course, not only of civil-service reformers, but of the civil service itself.

I have endeavored, and I think with success, to get to the bottom of the great mystery of the present Administration, and that is, the cause of what civil-service reformers consider the total, or all but total, disregard of the principles of civil-service reform by the President in his appointments, and his failure, though the first year of his administration is gone, to produce any systematic plan of reform. The explanation, like that of the Columbus egg-problem, is so simple that I am afraid the discovery will not bring me the credit I really deserve. It is that by civil-service reform he meant simply the exclusion of Congressmen from all share in the patronage, and not the imposition of any restrictions whatever on himself, the appointing power. The best form (for him) in which I have heard the case stated is that he looks on this exclusion, not as the whole of civil-service reform, but as the first or principal step in it; but I incline to think that he really has honestly, from the beginning, believed that that was all the civil-service reform he was required to carry out, and that it would furnish work enough for his term. Of course it is surprising that, even from this point of view, he should not have perceived the necessity, in order to make the exclusion of Congressmen permanent and win popular support for it, of making his exclusive use of the patronage respectable and thoroughly defensible. He evidently has not done so, however, and his failure to do so must be accepted as a sign of mental limitations for which his supporters were not prepared. But this, like other shortcomings, I cannot help ascribing, in part at least, as you have more than once done in your columns, to the defective if not dishonest character of the Presidential canvass, in which nothing was done to enlighten him or the people on what were really to be the great questions of his term of office.

As regards the condition and prospects of reform at Washington, they are easily described. Mr. Hayes has effected a real work of purification—that is, if he has not "disestablished the machine," he has made it decent. The oil is of better quality, and has no offensive odor. The frequenters of the White House are reputable and respectable, and there is no "mind-poisoning" going on in it. No notorious cheat, or knave, or jobber expects to get any shelter or support there against pursuit from the outside. The President, too, is ready to discuss and be persuaded, and even listen to vigorous remonstrance, and he is in sufficiently close relation with the intellectual currents of his time to be open to new ideas, and be capable of revising his own position. I am led to believe that he sees some of his mistakes, and that in-

deed a good deal of light has made its way into his brain since his election. I doubt, for instance, whether, if it were to do over again, so many "visiting statesmen" would have received high office, and whether all connection with Wells and Anderson would not have been repudiated from the first hour. But when one has said this, one has said all or nearly all that one can say on this side. There are only three departments at Washington in which reform is a practical and pressing question—the Treasury, the Post-Office, and the Interior. In the Treasury the matter has until now received no attention whatever. Secretary Sherman is neither opposed to it nor in favor of it; he simply cares nothing about it. It is to him a question of "lunar politics." The Postmaster-General, I understand, approves of it, and would like to see it triumph, which does not prevent Mr. Tyner, his Assistant, a "henchman" of the late Senator Morton, from conducting the department on the old plan and expressing openly his contempt for the proposed change. In the Interior the reform *is* strictly carried out, amidst greater obstacles than would be encountered anywhere else. Appointments are made through competitive selection; promotions are made for merit; investigations are conducted with the view of finding things out, and Congressmen have ceased to interfere, and Indian agents begin to find their life a sad one and their reward small. But then this is done under great difficulties—in the teeth of the fierce hostility of Congressmen, and of assaults of all kinds on the Secretary, set on foot by persons whom his "theorizing" is in one way or another likely to injure, the variety and malignity of which would be very amusing if I had space to illustrate them. One favorite device, the announcement of his approaching resignation, which was doubtless intended to dishearten and alarm the new agents, has not been resorted to for many weeks, and has probably been given up. Now, the curious thing in all this is that the indifference of the Treasury, the open recalcitrancy of the Post-office, and the zeal of the Interior, all receive the same tolerance and support from the President. He stands by Schurz, and also by Sherman and Tyner, with Roman firmness and Christian equanimity, and while making some appointments on the new plan makes plenty also on the old one, and is all the while as happy, from what I hear, as Parson Konak of Berlin, who maintains that the earth is flat as a pancake, and smiles at the astronomers. The explanations of this philosophy which one hears at Washington are, of course, various and contradictory. Many of his friends and supporters set it down in a shamefaced way to simple stupidity; his enemies, on the other hand, ascribe it to inherent wickedness darkened by the consciousness of fraud. The truth is probably, as I have before hinted, simply that his mental range and grasp and strength of will were greatly overrated during the canvass, and that while he is not doing as well as his warmest supporters tried to believe he would do, he is doing as well as they had the smallest reason to expect. I heard rumors of (under the circumstances) an unpleasant kind, that he already begins "never to look at the papers" and "not to mind what the papers say," which, if true, is, and in a government like ours must be, the forerunner either of fresh mistakes or of unhappy persistence in old ones—a proposition which is true even if "the papers" are all that those who most despise them say they are. Does it not seem as if Washington was the seat of a sort of mental and moral malaria, which neither Christians nor philosophers can resist, and which reduces some of the best men to light-hearted forgetfulness of their most solemn vows and best intentions almost as soon as they arrive? Judging from what one hears and sees of the destruction of political character which goes on in it, one is almost surprised that Congressional legislation is as good as it is.

VIAN'S MONTESQUIEU.

PARIS, February 9.

MONTESQUIEU is perhaps the most serious figure of the French literature of the nineteenth century. Though he did sometimes "sacrifice to the Graces," to use the language of the time, and wrote the vapid 'Temple de Gnide,' he stands before history as the author of the 'Esprit des lois,' one of those books which defy time, and which will always be read by the political philosopher. A young lawyer, M. Louis Vian, has attempted to write the life of Montesquieu with the most minute exactness—not in the vague and apologetic style which has so long been the fashion, but with the precision to which Sainte-Beuve has accustomed the later generation. M. Laboulaye, who writes a short preface to the work of M. Vian, notices with reason that among the famous men of the eighteenth century Montesquieu is perhaps the least known. The *Eloges* of D'Alembert, Maupertuis, and others are too academical. M. Vian began fifteen years ago to collect the editions of Montesquieu; from a mere bibliophile he became a historian. He has made real discoveries simply in turning over the pages of the various copies of the 'Esprit des lois,' and has detected in all the works of Montesquieu the hand of the censor, who was always curtailing and changing the works submitted to him.

Montesquieu was born in the manorial château of La Brède, not far from Bordeaux; his father was Jacques de Brède Secondat, Baron of Montesquieu; his mother was of English extraction. The Secondats had formerly belonged to the Huguenot court of the Queen of Navarre. The young Montesquieu was educated in the school of the Oratorians at Juilly, near Meaux, where he remained eleven years, till 1711. His family belonged to what was called the nobility of the Parlements; his two grandfathers had been presidents at the Parlement of Guyenne; his uncle was still president. He devoted himself naturally to the study of the law, which was then a difficult one, as it comprehended the Roman law, the canonical law, and the numerous *Coutumes* of the French provinces. He pursued his law studies at Bordeaux, and was named at the age of twenty-five Counsellor of the Parlement of Bordeaux. One year afterwards he was married to a Protestant young lady, Jeanne Lartigue; and the marriage presented some difficulties, as the young bride was a zealous Calvinist, and refused to change her religion. At that time the Protestants had ceased to have any civil rights. Since the revocation of the Edict of Nantes it was forbidden to open a Protestant chapel. Protestants, and even Catholics who were married before a Protestant minister, were not legally married. Montesquieu and his bride could have no Protestant service; they were married in the Catholic church of St. Michel in Bordeaux, and the priest was supposed not to know that the bride was a Calvinist. Nobody was invited to the ceremony, and Montesquieu's relations were absent. It has always been supposed that Montesquieu married Jeanne Lartigue because she had a large dower, as she was plain, a little lame, and he did not respect the ties of matrimony any more than most of his contemporaries.

At the death of his uncle, Montesquieu became in his place president *à mortier* of the Parlement of Guyenne, an office which could at that time, like so many others, be left by inheritance. (The *mortier* was a cap of black velvet with a gilt band.) He was well prepared for his difficult functions; the Parlement of Bordeaux followed the Roman law in many matters, but had also to give application to no less than ten provincial *Coutumes*. At the age of thirty he published the famous 'Lettres Persanes.' The book appeared, without any author's name, at Paris under the false designation of Cologne, in 1721; its success was immense. The Regency was beginning, and the tone of the 'Letters Persanes' suited a society which was tired of the severity of the latter part of the reign of Louis XIV. The frivolity of the form masked what might have alarmed the clergy and even the Government. Montesquieu himself always spoke lightly of this work, which he called a "péché de jeunesse." The clergy objected, however, to some parts; the Persians of Montesquieu spoke of the world as eternal; they did not believe that the foresight of God could be combined with the liberty of man. Cardinal Dubois thought it necessary to interdict a work which offended monarchy and religion.

Montesquieu had become a "lion"; he made the acquaintance at the Hôtel Soubise of all the men of letters; he became a member of the "Club de l'Entre-sol," founded by Lord Bolingbroke, with the philanthropic Abbé of St. Pierre, with D'Argenson and others. He wrote at that time the 'Dialogue of Sylla and Eucrates,' a splendid page of rhetoric, which is a sort of preface to the 'Considerations on the Rise and Fall of the Romans.' He wrote also the erotic 'Temple de Gnide' for Mademoiselle de Clermont, a sister of the Duke of Bourbon. Montesquieu long disavowed this work, which was at the time attributed to Fontenelle and to the President Hénault. It is, however, certain that the popularity which the 'Temple de Gnide' gave to Montesquieu in the corrupt society of the time assisted him not a little to be named a member of the French Academy. His election, however, was annulled, as the statutes of the Academy required every member to live in Paris, and Montesquieu was obliged to reside chiefly in Bordeaux. (These statutes have not been changed, though many members of the Academy to-day live chiefly in the provinces; it is enough if they appear from time to time at the Institute.)

Montesquieu was tired of the obscure honors of Bordeaux; he sold his place as soon as he could, and fixed himself in Paris. He was re-elected to the French Academy, chiefly by the influence of the Marchioness of Lambert, who kept at the time the keys of the Immortals' *cœnaculum*. The election was a real battle, as the clergy made great efforts against the author of the 'Lettres Persanes.' Cardinal Fleury wished to read

the famous 'Lettres,' and in a few days a copy was prepared in which the "dangerous" passages had been suppressed. This fraud was accomplished by the introduction of new pages, which our printers call *cartons*. Montesquieu was already preparing the 'Esprit des Lois,' and, in order to enlarge his horizon, he undertook long journeys in Germany, in Hungary, in Italy, in Holland, and in England. It is a great pity that he did not publish the diary of his travels. He left Paris in company with Lord Waldegrave, who was going as Ambassador to Vienna. In Italy he joined Lord Chesterfield. It was in Rome that Montesquieu formed the project of his 'Considerations on the Rise and Fall of the Romans.' He remained eighteen months in England, in company with Chesterfield, with Lord Bolingbroke, with Walpole; he sums up his observations on his travels in short sentences: "When I am in France, I am friendly with everybody; in England, with nobody; in Italy, I make compliments to everybody; in Germany, I drink with everybody." On his return to France, he went to his Château de la Brède, made an English park, entailed his property, and asked that it should be named a marquisate. He published the 'Considérations' first at Amsterdam, afterwards in Paris. This book met with little success, and the "beaux-esprits" of Paris said that the 'Lettres Persanes' had been the "rise," and that the 'Considérations' were the "fall" of Montesquieu.

When he went to Paris, Montesquieu lived habitually at the Duchesse d'Aiguillon's. She gave a *souper* every Saturday; she was, in the words of Gustave III., the living journal of the court, of the town, of the provinces, of the Academy. Voltaire was one of her correspondents. "Madame d'Aiguillon," says Madame du Deffand, "has a mouth drawn in (*enfoncée*), her nose is not very straight, her eye is mad and audacious, and nevertheless she is handsome. Her beautiful complexion has the best of the irregularity of her features. Her waist is coarse; her arms are enormous. Strength takes the place of lightness." Montesquieu was fond of society, but he said: "I prefer the houses where I can get along with my every-day *esprit*." He knew Madame du Deffand, Madame Geoffrin, Madame de Rochefort, but he was not one of their *intimes*.

Montesquieu did not write with his own hand in the latter part of his life, as his eyes had become weak. He dictated the 'Esprit des lois' to his secretaries. This great work was composed in the library of the Château de la Brède, an immense room which can still be seen; it is on the first floor of the château, and is as much as seventeen metres long and eleven broad. On the doors are devices; one—

"Au magistrat rends humble obéissance;
Il a de Dieu ces honneur et puissance."

On the other, one reads—

"Ton Dieu surtout aime d'amour extrême,
Et ton prochain comme toi-même."

The books are still in the wooden bookcases, and many of them have old paper-marks between their leaves. The catalogue of this library has been published by M. Gustave Brunet; it is chiefly composed of classics, and comprises the most important works of Greek and Roman antiquity.

Montesquieu had given the printing of the 'Lettres Persanes' and of the 'Considérations' to Holland. He chose Switzerland for his 'Esprit des lois'; the book appeared in Geneva, in two volumes in 4to. It had for its epigraph "Prolem sine matre creatam," and, in fact, it can hardly be compared to any work published before it. Montesquieu studies in it, in a scientific spirit, the philosophy of government. I will not attempt to analyze it. Every man of culture knows Montesquieu's definitions of the various forms of government, his classification of the great forces which control and govern humanity. The French censorship did not allow the publication of Montesquieu without some changes. M. Vian gives us the text of the *cartons* which embody the exactions of the controllers of French public opinion. It is almost painful to read them, and to imagine that men have held office with the special mission of veiling the truth by a few words and epithets. It was thought seriously that grammar might be a barrier to the revolutionary spirit which was already pervading France. The revolutionists of '93 did not derive their inspiration from Montesquieu. The president of Bordeaux was not a leveller like Rousseau; he was more like an English Tory; he had no objection to representing "abuses" himself, though he understood the necessities of the time and had a progressive mind. His great book, notwithstanding the changes made in the *cartons*, was finally forbidden in France; but it was as much read and more than if the censors had allowed its sale.

Montesquieu did not write much after his great effort; he had completely lost his eyesight; he died in Paris, the 10th February, 1755, at the age of sixty-six years. His body had disappeared in 1793, and was probably thrown into the Catacombs.

Correspondence.

GODWIN'S 'CYCLOPÆDIA OF BIOGRAPHY.'

To the Editor of The Nation:

Sir: A reader of the letter of Mr. Parke Godwin in the *Nation* of February 21, in reference to the 'Cyclopædia of Biography,' might (if unacquainted with the history of the work) easily obtain the impression, which we are confident Mr. Godwin could not have intended to convey, that the publishers were now "revamping," with inconsiderable additions, a work which had been practically superannuated and had been out of sale for some years, and that this reissue was made without proper authority.

So far is this from being the case, that under the imprint of G. P. Putnam, Hurd & Houghton, and ourselves, the book has been kept in continuous sale from the date of its first publication to the present time, and it has never been published or known under any other name than 'Godwin's Cyclopædia.'

In adding the two supplements of 1865 and 1877, care was taken both on the title-pages and in the prefaces to make it clear that the original editor had no responsibility for the additional material, and we do not understand that, until this letter of last month, Mr. Godwin had ever claimed the right or expressed the wish to have the title of the work altered.

The two supplements appear to have been well executed, and to have brought no discredit upon the original work, as they have received the favorable notices of the best critics, and have enabled the book to hold its own against the competition of other works of the class. Some corrections have been made in the first portion of the book, but, as your literary editor has, with kind courtesy, taken pains to advise us in *two* successive numbers of your paper, some further errors still remain, which are now receiving our attention.

We have yet to find a work of reference in which the searching process of criticism could not bring to light a list of errors, and we would merely claim for the 'Cyclopædia of Biography,' in justice as well to Mr. Godwin as to its later editors, that, as well for accuracy as for general serviceability, it will compare favorably with both English and American works of its class; and we are content to leave to the public the decision as to its permanent value.—Yours truly,

G. P. Putnam's Sons.

REPUDIATION MADE EASY.

To the Editor of The Nation:

Sir: In your last issue I notice a letter from a correspondent relative to municipal indebtedness in Missouri, and as I have recently received a circular from a regularly appointed official swindler upon the same business, I beg to enclose it herewith, and ask that you will make such use of it as will best serve the interests of honest men. I have already shown it to parties who have *heretofore* invested largely in Western securities. It is about as barefaced an invitation from the State to the cities and towns to cheat their creditors as one would care to see even in these times.

Respectfully yours, F. E. Seaver.

Boston, March 2, 1878.

[We subjoin the circular referred to by our correspondent, and a portion of the statute printed on the same sheet.—Ed. Nation.]

Office of General County, City, and Municipal Agent of the State of Missouri,
Jefferson City, Mo., February 26, 1878.

The undersigned gives notice of his appointment as General County, City, and Municipal Agent of the State of Missouri.

The object of the law creating this office is to bring about an acquaintance and, if possible, a mutual understanding between defaulting or insolvent municipalities and their creditors, which will result in an adjustment of existing municipal debts upon a fair and honorable basis, and upon a plan which offers more security and better guarantees to the bondholder and a lighter burden to the debtor, and thus advantageous to both. Attention is called to our new Constitution and recent legislation, by which the issue of municipal bonds is restricted almost to prohibition, and compromise or renewal registered bonds are authorized, the principal and interest of which is collected by the State.

Full and authentic information in regard to any county, city, or township bond issued by any municipality within this State will be furnished upon application.

It is the desire of this department to put itself in personal and direct communication with every Missouri bondholder.

JAMES CRAIG,
General County, City, and Municipal Agent of Missouri.

EXTRACT CHAPTER 22, ARTICLE II., STATUTES OF MISSOURI.

SECTION 1. That with a view to enable negotiations to be conducted between the municipalities in this State, whether county, city, township or other municipality, which may be disposed to effect a compromise or composition of their bonded debts, principal and interest due or to become due, and the creditors or holders of bonds issued by or in behalf of such municipality, there shall be appointed by the governor a General County, City, and Municipal Agent, who shall hold his office for two years, and who shall be authorized to receive proposals from the authorized agents of the municipalities, in regard to the terms upon which said municipalities will settle, and to ascertain from the holders of said bonds, so far as they are known, upon what terms they are willing to accept new bonds, upon what rate of interest, and what times of payment, subject to the conditions hereinafter specified. . . .

SECTION 4. The General County, City, and Municipal Agent shall, as his compensation, be entitled to a percentage on the amount of debts thus compromised, as shall be previously agreed upon, not to exceed one-tenth of one per cent., to be paid by the county, city, or other municipality in whose favor such composition is effected.

SECTION 9. It shall be the duty of the General County, City, and Municipal Agent appointed under this act to ascertain, as far as practicable, the holders of the bonds referred to in this act by correspondence and by publication in one or more newspapers.

AN OBJECTION TO BI-METALLISM.

TO THE EDITOR OF THE NATION:

SIR: There is one objection to the theory of bi-metallism which deserves more attention than it has attracted, and which is, I believe, entirely ignored by Cernuschi. This objection is that the functions of gold and silver as mediums of exchange are not only not identical, but the tendency of civilization is to differentiate them more and more.

Gold, as a medium of exchange, is most useful in large payments; silver in small payments. Somewhere below ten dollars there is a neutral ground where either metal may be used with equal convenience; but, except on this neutral ground, convenience dictates that the uses of the two metals be kept distinct. Whatever may be the limits of this neutral ground, it is only necessary to note that, outside of it, the separation of the functions of gold and silver coins is as natural as is the demand for the precious metals for money.

Bi-metallism claims that it can fix by law the ratio at which gold and silver coin shall circulate together; but bi-metallism must do something more than this—it must make it possible for gold and silver coins to be used interchangeably in performance of the same function as a medium of exchange; or, to put the case as it would probably happen in the United States, bi-metallism must make silver take the place of gold to some extent, and perhaps to a great extent, in transactions above ten dollars. For if by any supposable cause the volume of silver, under a bi-metallic system, should be permanently and greatly increased—say trebled—one of two things must take place: either the purchasing power of silver must be permanently and greatly lowered (in the supposed case perhaps two-thirds) and destroy the legal ratio, or else silver must be used in common with gold in large payments.

According to my thinking, money is simply a machine for measuring and distributing wealth. In the building of the money-machine, as in the building of any machine, experience teaches mankind what metals are best suited for its purpose, and also what function each metal can best serve. We see in India a money-machine made principally of silver, and in certain parts of Africa the money-machine is made of gold-dust; but the inconveniences of the Indian and African machines are so apparent that civilization has long since rejected them. Nor do I believe that civilization will rest content with any money-machine wherein the convenience of those who use it is ignored. The greater convenience to buyer and seller of twenty dollars in gold to twenty dollars in silver, in a twenty-dollar payment, needs no illustration.

This question of separate functions, then, is *only* a question of convenience. But what is convenience? What principally gives the utility to gold and silver, and thus confers upon them their purchasing power? Only the fact that they are more *convenient* than any other commodities for money.

Bi-metallism may, in spite of all objections, succeed in holding the metals together at a fixed ratio, on the same principle (to appropriate Prof. Walker's happy simile) that two horses, not perfectly mated, may be driven together. No sensible man, however, would dream of harnessing Dexter and a dray-horse to an omnibus, not only because of their different gaits, but because, though both are horses, their uses or functions are absolutely distinct.

Favoring circumstances alone can make bi-metallism to any extent a success; there is nothing in the nature of things which gives a scientific basis to the theory. B.

BOSTON, February 16.

PRESERVATION OF MONUMENTS IN EUROPE.

TO THE EDITOR OF THE NATION:

SIR: Not very long since a communication in relation to the preservation of the Old South Church in Boston appeared in the *Nation*, in which it was incidentally stated that in Europe the preservation of old monuments is made an object of zealous governmental care. The number of the *Nation* in which this statement was made came to me at Spezia just after I had been pained at witnessing the process of destruction of the fine old monastery there—a place memorable as having been visited by Dante in his exile, and a conspicuously lovely feature of this lovely part of the Gulf of Genoa—that a fortress might be placed upon its site, and after hearing that the noble and historic old castle of Lerici was soon to share a similar fate. I quickly recalled almost numberless instances which I had seen or heard of elsewhere in Italy (the placing of a huge military barrack on the site of the old castle of Theodoric at Verona, utterly destroying one of the noblest landscapes in Europe; the destruction and building up anew of the south porch of St. Mark's Church at Venice, and the proposal that its entire façade should be pulled down and a new one built to match the new porch; the removal of the great capital of the Adam and Eve angle of the Ducal Palace—one of the most wonderful carved stones in the world—to be replaced by a new one of modern mechanical manufacture, among them), and I thought how little like preservation of or respect for old monuments all this was. But recently I have been more than ever pained and astonished to see what is now taking place with the Duomo of Florence. Some weeks ago I observed that heavy scaffolding was going up against one of the walls of the south transept, but I supposed it was for the purpose of effecting some necessary repairs, though I could see nothing out of order. I have since learned, however, that it is being used for the purpose of carrying on one of the most destructive and foolish processes of so-called restoration—that, namely, of scouring off, with strong acids, all the old weather-stain, the golden color of ages; of picking out and replacing with new all cracked or broken fragments of mosaic; and of *tooling over the old sculpture*.

Upon mounting this scaffold I was astonished to see, not only the destructive character of the work, so far as the supposed restoration of the sculpture is concerned, but the extreme carelessness, as regards the old work, with which it is done. I found the delicate capitals of the window-shafts entirely unprotected, and freshly broken, in many places, by chips which the workmen had let fall upon them from above. The exquisite gable crockets—originally most wonderful for subtle carving of undulating surface, and spring of curvature—were ruthlessly hacked over and spoiled. I have ascertained that the intention is to go completely over the cathedral in this manner, in order to make the old work look fresh and match the new façade now in progress.

It may be useless to dwell upon the deplorableness of these things, but it should not be supposed that European governments, when they permit them, really protect their monuments. I understand, in this case, that the commission who have the matter in charge are divided in their views about it, and that a minority have protested. Evidently few persons in Italy care anything for the beauty of their old art. Pulling down and rebuilding, scraping and scouring, are looked upon as indications of renewed thrift and respectability.

The destruction which has thus been carried on in Europe during the past few years, is incalculable, and if it is not soon stopped there will be little left. Already M. Viollet-le-Duc, one of the best so-called restorers, has extensively defaced, if not destroyed, nearly all the French cathedrals, and Sir Gilbert Scott and others have done the same with the cathedrals of England.—Truly yours,

CHARLES H. MOORE.

FLORENCE, 10th Feb., 1878.

Notes.

GEO. ROUTLEDGE & SONS will shortly publish here 'Walks in London,' by A. J. C. Hare, which can hardly fail to be an important addition to the tourist's outfit.——Macmillan & Co. have nearly ready Laveleye's 'Primitive Property.'——'A Guide to American Literature' is

announced by E. Steiger.——Porter & Coates, Philadelphia, are about to bring out a new and cheap edition of Wilson and Bonaparte's 'American Ornithology,' three volumes in one, together with 103 new plates.——Dr. L. Sauveur's Normal School of Languages—a summer school for teachers—will hold its third session at Amherst, commencing Tuesday, July 9, of the present year, and continuing for six weeks. There will be sections in French, Spanish, Italian, German, Latin, Greek, Hebrew, and Sanskrit. Arrangement for board at Amherst may be made through the Janitor of the College, Mr. L. Gates.——We are glad to learn that the Rev. Henry G. Spaulding's morning lectures on Roman antiquities, concluded last week in this city, are to be followed by six Monday evening lectures on "Roman Life and Art," beginning March 11, at Chickering Hall. They are genuine object-lessons, in which the stereopticon is constantly employed by way of illustration, the views being carefully selected and of a very striking character. Tickets for the course are obtainable at the bookstore of E. P. Dutton & Co.——Milmore's bust of Charles Sumner, presented by the State of Massachusetts to Mr. Geo. William Curtis in acknowledgment of his eulogy on the senator delivered before the State authorities, is now on exhibition at the Metropolitan Museum in Fourteenth Street.——A very full measure of information and illustration is given in the new and tasteful guide-book called 'Harvard and its Surroundings' (Cambridge : Charles W. Sever). The principal buildings pertaining to the University are shown in excellent heliotypes, while other objects of interest are suggestively rendered in etchings interspersed through the text. To an old graduate perhaps the most striking sign of the growth of the college is the number of costly dormitories lately erected outside the grounds by private capital.——We learn from the Chicago *Alliance* that it was "our advertising man" who was "led to believe that the infamous tea-firm of C. A. Long & Co. was responsible and had a respectable backing."

——The well-known and somewhat voluminous author Ebend. ; his friend Ander Schiffahrt, the protégé of Mr. Henri Harisse; Thesaurus, whose works in 2 vols. folio have been recorded in several English booksellers' catalogues ; and Mill, not the author of the 'System of Logic,' but the one whose book 'On the Floss' ladies sometimes ask for at public libraries, these (shall we say, pseudonymous authors) have now a companion. The *Bibliotheca Sacra* for January notices a book by a Herr Domkapit. Secular bibliographers would have supposed the author to be a certain *Domkapitular*, or Cathedral Canon Petz ; but on theological matters Andover is an authority. The interpretation put upon this title-page by the *Bibliotheca Sacra* recalls the catalogue of a certain New York library in which might be seen, some years ago, a Portuguese work credited to Por de R. Franquelo, the German memoir of Bunsen to S. Wittwe (in other libraries interpreted as "his widow"), and a still more remarkable entry of the 'Mecum Vade for malt worms,' as 'For malt worms. By Mecum Vade.'

—The *Fortnightly Review* for January contains an address on "Technical Education," delivered by Professor Huxley last December before the Working Men's Club and Institute Union. Professor Huxley's advice has special reference, of course, to English conditions, but much of it has a universal application, and his *obiter dicta* are, as usual, eminently happy and suggestive. In brief, he holds that a boy whose prospect is to be bred to a handicraft should have a good English elementary education, and such a real knowledge of the rudiments of physical science, particularly physics and chemistry, as can be learned by the time the age of thirteen or fourteen is reached. In addition, he should be "able to read a scientific treatise in Latin, French, or German," and to draw with fair accuracy. The technical training should be begun not in the school but in the workshop. "The education which precedes that of the workshop should be entirely devoted to the strengthening of the body, the elevation of the moral faculties, and the cultivation of the intelligence ; and especially to the imbuing of the mind with a broad and clear view of the laws of that natural world with the components of which the handicraftsman will have to deal." It should avoid being "carried so far as to encourage bookishness" or the "mischievous delusion that brainwork is, in itself, and apart from its quality, a nobler or more respectable thing than handiwork." Professor Huxley finds the elementary schools already established in England sufficient for this preliminary instruction, which leaves boys free to enter into working life and contribute to their own support as early as they do now. For supplementary training in science and art provision also exists, and has for eighteen years existed, "in the classes of the Science and Art Department, which are for the most part held in the evening." There is still one desideratum, to meet the cases of exceptional talent or rare genius. "As the sum and crown of what is to be done for technical education, I look to the provision of a machinery for winnowing out the capacities and giving them scope." This might naturally fall to the lot of the powerful and wealthy livery companies of the City of London, "the heirs and representatives of the trade guilds of the Middle Ages"; and they are, in fact, considering the matter. Professor Huxley allows himself one political allusion. "A great deal is said of British interests just now, but depend upon it that no Eastern difficulty needs our intervention as a nation so seriously as the putting down both the Bashi-bazuks of ignorance and the Cossacks of sectarianism at home."

—In the February number of the *Nineteenth Century* there is a remarkable article on Mrs. Siddons as *Lady Macbeth*. It contains a series of extracts from the play, copiously marked and annotated with particulars of that actress's intonation, emphasis, action, and attitude, by Professor G. J. Bell, of Edinburgh, a contemporary lover of the stage, who about 1809 filled three volumes of an acting edition of plays with as many particulars of the acting of John Kemble and of his sister as could well be put on paper. Professor Bell was evidently a man of taste and well fitted for the task. How well worth doing his work was it is needless to say. Professor Fleeming Jenkin, to whom we owe the publication of these notes, draws attention to the real pain felt at the perishing of any beautiful thing, at the absolute loss of any great work of nature or art. Yet from its very essence an actor's work must perish, such memorials as these of Professor Bell's being unfortunately as rare as they are valuable. The example chosen for publication is excellent. *Lady Macbeth* was perhaps Mrs. Siddons's best part; and as far as it is possible to ascertain by comparison of criticism Mrs. Siddons was the greatest of all *Lady Macbeths*, before or since. We have no space to quote from these records, and can only remark further that the reading of them will tend to controvert the received opinion that Kemble was the mental superior of his sister and the more inventive intellect of the two. Professor Bell seems hardly to do justice to the brother, who we have been told devised "business" for his sister's benefit.

—The annual report of the Hospital Visiting Committee recently made to the State Charities Aid Association shows the usual continued improvement in the only department which is effectively divorced from politics—that of Trained Nursing—and the usual absence of it elsewhere. They call particular attention to the condition of the cells for the reception of insane and violent patients at Bellevue, describing them as "ill-ventilated, reeking with foul air, gloomy, and damp." In these cells, it seems, the drunken and insane, together with the paralyzed and incurable, are crowded for days. The doctors' visits are not made daily, and cases sometimes accumulate for nearly a week before any medical examination is made, and this although the city pays for the work. The description of the cells reads like an account of those in a madhouse in the last century. They are "so damp," the committee say, "that we have known of a case of malarial typhoid being engendered there"; while the male cells are conveniently placed directly under the female medical ward, so that "the shrieks of the imprisoned maniacs are continually terrifying the sick women above." The committee have something to say, too, about the responsibility for the management of institutions on Blackwell's and the other islands, a matter which they justly remark is shrouded in "much mystery." When an abuse or neglect of duty is discovered—as, for example, the absence of articles necessary to cleanliness, *e.g.*, soap, towels, combs, and brushes—the practice seems to be for the commissioners and everybody concerned to admit with the most engaging frankness that it is all wrong, and that somebody is to blame ; but when an attempt is made to ascertain who the culprit is, we are plunged in Cimmerian darkness. The fact is, that the system of administration now in vogue is devised for that especial object. If you could find out who was to blame, there would be a speedy end to the system. In order to have responsibility, there should be one efficient commissioner, with a long tenure of office, and he should have absolute control over the appointment and removal of his subordinates. In fact, what is needed is exactly the system which has been recently introduced into the prisons of the State, and which has already been followed by such satisfactory results. The prisons and hospitals of the city are now "run" as a branch of Tammany Hall, and so long as this continues to be true, all we can hope for is the amelioration of necessary abuses by volunteer effort. One of the best illustrations of the way the machine works at present is given in what the committee say about the "ten-day women." The enlightened and humane policy of the commissioners has been until lately, and we suppose still is in most of the hospitals, to use these creatures sent up

to the island for drunkenness as nurses and "helpers," and this has led to a volunteer attempt to reform them which has been marked with success. Of course this is an excellent thing; but there is something very characteristic in a system which begins by selecting grossly unfit persons for a responsible position, their unfitness being afterwards ameliorated by a volunteer charitable organization which undertakes to "reform" them.

—The plan of putting up an armory in Washington Square, as made public, looks to the construction of a huge barrack extending from the centre of the park on the line of South Fifth Avenue to the easterly side. Such a building would split the square in two, make an ugly of a pretty quarter of the city, and pave the way for the future occupation of the whole space. There is no necessity for this, and, so far as we have observed, public opinion is unanimously against it. That an armory can be put up there for General Shaler at a less expense than elsewhere may be true, but this is also the case whenever a public building is required. Land can always be obtained more cheaply by taking the parks than by renting or purchasing, and if a bit of one park is to be taken, there is no reason why all the others should not be invaded as well; so that this attempt to seize Washington Square may, without exaggeration, be regarded as a menace to every similar place in the city. Apart from this general danger, there is every reason why the appropriation of this particular square should be vigorously protested against. The park is one of the oldest and prettiest in the city. With the picturesque University buildings on the east side, and to the north the old-fashioned, substantial dwelling-houses—not a modern row of "four-story, high-stoop, brown-stone fronts," but a quiet row of well-built houses, suggesting a life within of a different sort from that led by the MacGillicuddys and the Potiphars—removed from the roar and bustle of Broadway, it seems, what in fact it is, a quarter of an older and pleasanter town which luckily has escaped the ravages of contractors and street-openers, and survives to remind us that city life is not necessarily ugly and repulsive. Washington Square, too, is one of the few public parks in the older parts of the city in which rich and poor meet on common ground. The south side of the square and the streets near it are inhabited by people of the poorer class, who have looked upon the park for years as their children's playground, and on Sundays and public holidays in the spring and early summer it is pleasant to notice that the shade of the fine old trees and the cool breezes are not monopolized by the rich at the expense of the poor, nor by the poor to the exclusion of the rich, but are really democratically shared by both classes. For a democratic city it is singular how little this is the case in most of the old parks. They generally fall a prey to some distinct class, as with Tompkins Square, or else become mere thoroughfares, like Madison and Union Squares. But Washington Square has preserved this characteristic of a bygone time, and with its fountain, and its broad walks and shady seats, filled with merry children, nurses with their white caps, and here and there a group of enterprising householders spending the morning *al fresco* with their neighbors, it suggests faintly the pictures of life in New York handed down to us by our grandmothers, when the Bowling Green was in all its glory, and the Von Twillers and Stuyvesants used to take their afternoon stroll upon the Battery. The destruction of any old park is an evil; when it is avoidable it is an outrage. With regard to Washington Square, besides all the other considerations, there is serious reason to apprehend its effect on the public health; a large number of the most eminent physicians of this city have expressed their opinion that it will increase the death-rate. Since the days when the Central Park fell into the hands of the Ring no such scandalous interference with public rights has been attempted, and it will certainly be an alarming proof of the tameness of the public if they submit to it.

—The recent affray at Princeton has been much discussed in the newspapers as if it was simply a question of "hazing," but the remarkable part of the affair is the use of fire-arms in connection with undergraduate pranks. There is nothing very new or singular in a number of sophomores playing a trick on a freshman in order to get him into their power, or in a retaliation on the part of the freshmen; this has happened hundreds of times before, but we do not remember in college annals any instance of a regular shooting affray, with both sides armed to the teeth, and firing repeated volleys into each other at short range. The carrying of concealed weapons, as a general practice among college students, would, we fear, prove fatal to the "higher education," and a shooting affray of this sort seems to imply a pretty general familiarity with the use of fire-arms. The Princeton faculty have taken this view of the matter, and have sent off some seventeen of the culprits. We are glad to see, too, that the occasion has been improved by a correspondent of the *Tribune*, who makes a suggestion of a novel character with regard to hazing, which the *Tribune* thinks worth at least calling attention to editorially. The influence that is best calculated, this correspondent says, to tame the brutal passions that now find a vent in hazing, and to direct the natural energy of sophomores into new and pleasing channels, is none other than that of flowers. It is difficult, he says, to overestimate the mollifying effect of flowers on the hard-hearted and cruel, and he cites the beautiful practice prevailing at one of our prominent bi-sexual institutions of learning, where the sophomores, instead of receiving the new class with injurious words and treatment, receive them with bouquets. He notices that at Harvard they have been planting out flowering shrubs lately in the college grounds, and thinks that this may have contributed materially to the decline of hazing there.

—Just ten years ago the Radical North was hopeful, the South was correspondingly fearful, that the impeachment of Andrew Johnson would end in making the President of the Senate, Benjamin F. Wade, President of the United States. Neither the hope nor the fear was fulfilled, and a year later Mr. Wade's political career terminated on his retirement from the Senate, in which for eighteen of the stormiest years in the history of the Republic he had been the very type of courage, steadfastness, indomitable energy, and incorruptibility. On Saturday last "the old Roman," as he was sometimes called—"the old wheelhorse," by another metaphor—died at his Ohio home after a characteristic struggle with the disease which finally overcame him. At a time when the North was represented in Congress chiefly by cowards and doughfaces, he entered the Senate as a Whig, but first and above all as a man; and a man he remained through all the perilous days of the Fugitive-Slave Law excitement, of the Kansas and Nebraska iniquity (which drove him into the ranks of the Republican party), and of the gathering storm that preceded the rebellion. He won the respect of Southerners who would gladly have seen him hung for his anti-slavery opinions, never concealed or disavowed, and when the civil war actually broke out he naturally took his place as chairman of the joint Congressional committee on the conduct of the war, where his services were real and invaluable. It is too soon to decide when he began to outlive his usefulness. Some may draw the line at his opposition to the re-election of Mr. Lincoln, in 1864, others at his opposition to Mr. Johnson and his share in the reconstruction measures of that difficult period. Enough to say that whenever the time for peace and reconciliation had arrived this "happy warrior's" day was over. He had neither the forgiving temper nor the judicial mind (one smiles to read in the biographies that he was once a State judge) which the new era demanded, and he became the hindrance which all partisans become who keep charging up and down the field when the burying of the dead is going on, and both sides are levelling the earthworks and putting things to rights. His latest public utterances were fiercely denunciatory of President Hayes's Southern "policy." Mr. Wade was born in Springfield, Mass., in 1800, and removed to Ohio in 1818, where, after ten years, he was admitted to the bar. His first political office was that of State Senator, in 1837, when already he honorably distinguished himself by his hostility to slavery and color prejudice. In 1851 he was sent to the United States Senate. In 1869, he had some claims, as an ex-Congressman if nothing more, to a seat in Grant's cabinet, but it was not offered him. In 1871 he accepted an appointment on the San Domingo Commission, and became an ardent advocate of annexation.

—The 'Théâtre de Campagne,' of which we last year noticed the first two series, met with so much success that a third volume has just been issued and is already in its second edition. It contains ten pieces, varying in length from a poem of nine short stanzas, "Les Prunes," by M. Alphonse Daudet, to "La Force des Femmes," a comedy by M. Henri Meilhac, extending over seventy-five pages. None of these little plays is quite as good as the best in the preceding volumes, but perhaps their average merit is higher. All of them, except possibly M. Meilhac's, are innocent and fit to be read aloud by young ladies. To any one who believes in the theory that the French drama of the day is wholly given over to the devil we can recommend a reading of the twenty-eight plays, by many of the leading authors of the time, contained in the three volumes. They are nearly all quite clean, nearly all amusing, and nearly all very neatly done. Those who never weary of studying the proofs of the continuity of the human species will find agreeable reading M. A. Joly's 'Histoire de deux fables de La Fontaine, leur origines et leurs pérégrinations.' The two fables here discussed are both from the seventh book, viz., *Les animaux malades de la peste* and *La*

laitière et le pot au lait, and their wanderings from India through Persia, Arabia, Turkey, Spain, Italy, and yet other European countries, and their nimberless transformations, are discussed in two learned and curious chapters. In an appendix the texts borrowed from other literatures are gathered together. Wuttke's work on German journalism and the formation of public opinion, 'Der Reptilienfond,' is now accessible in a French translation, 'Le Fonds des reptiles.' The unproductive epoch of the First Empire has seemed to M. Gustave Merlet to stand in need of rehabilitation, and he has accordingly devoted a considerable work to it under the title of 'Tableau de la littérature française, 1800-1815,' the first volume being concerned with the religious, philosophical, and poetic movement, as embodied in Bonald, De Maistre, and Châteaubriand. Two kindred works noticed by M. Charles de Ribbe in the February *Polybiblion* seem also to merit the attention of students of history and society. These are 'Le Village sous l'ancien régime' of M. Alfred Babeau, and 'La Vie de province au 18e siècle' of M. Anatole de Gallier; the latter being an interesting collection of letters forming part of the correspondence of a distinguished provincial family, the Aymons of Dauphiny.

AMERICANS IN TURKEY.*

'AMONG THE TURKS' is a book containing sketches of the personal experience of a missionary who resided for thirty-five years in Turkey, chiefly in Constantinople, and giving at the same time various anecdotes and stories, all of which are entertaining, with remarks and inferences which, in many cases, are not borne out by the context. Dr. Hamlin is a remarkable man, and combines with a high intellectual faculty an executive ability and a power of practical work which are very rare among missionaries, and even among ordinary men. He has made a greater impression, and we think, too, has done more good, than any missionary, or in fact than any American who has ever been in Turkey; but we are inclined to believe that his judgments are sometimes hasty, and that living in a certain groove—chiefly in the capital—he has not, even in the thirty-five years of his residence in Turkey, had a sufficiently large experience to enable him to prove certain theses which he puts forward. In one respect particularly Dr. Hamlin is untrustworthy as a guide. While knowing little about Russia, he fears and dislikes that country. His fear seems chiefly directed to one point, viz., that if Russian influence should become predominant in Turkey the missionaries would not be so able as before to turn Armenian and Greek Christians into Protestants, for of the conversion of the Turks there is as yet very little thought, and the American missionaries in Turkey do not occupy themselves with the Jews. This feeling has influenced, without doubt insensibly, many of the statements and deductions in the book before us, and it is to be feared that Dr. Hamlin has rather injured than improved his cause by his dislike of Russia and his suspicion of Russian plots and intrigues when they were not.

In reading a book like this, which, while not exclusively devoted to instances of missionary work, has yet so much to say of missionaries and Americans in Turkey, one is naturally led to enquire what in reality have the Americans done and what are they now doing there? These are broad questions which can scarcely be answered within the limits of a brief review, but to which at present it is difficult to find any satisfactory answer. Certainly none can be gained from the columns of the missionary and religious journals, where simple facts are confused with what—for want of a better and more polite term—must be called missionary slang. In advance, it is a pleasure to say that the missionaries have done great good in Turkey; but it has been more by their secular work, of which Dr. Hamlin has given such an interesting account, than by their religious work. They have done good, not by making converts and building Protestant churches, by ordaining native Protestant teachers and by distributing broadcast amongst the people tracts against the rites and beliefs of the Eastern Christians, but by their schools, by their readiness to assist in any works of charity and humanity, and by the outside influences which have accompanied them. The Protestant communities which they have founded are composed, as a general rule, of men of no station or repute among their fellow-countrymen, and who have frequently been more of a burden than a profit to the mission, and who exercise no appreciable influence on the towns and villages in which they reside.

Turkey, as a mission field, has been distributed between the American Board of Missions, the Methodist missions, and the Presbyterian missions; the Methodists devoting themselves chiefly to Bulgaria and the neighborhood of the Balkans, the Presbyterians to Syria and Palestine, and the American Board taking the rest. Roughly speaking, the missionaries themselves may be divided into two classes—those whose sole aim is to do good, and those whose chief aim is to proselytize and Protestantize. The writer is unable from personal experience to say anything about the results or working of the missionaries of the Presbyterian Board in Syria, but as far as the others are concerned, it seems to him that the Methodist missionaries are those who generally aim at doing good first of all, and who have consequently done the most good and have exercised the most prominent influence. Dr. Hamlin, though not a Methodist, belongs to the first class, though we think with considerable longings towards the second class. The results of the labors of the Methodist missionaries in Bulgaria have certainly been very great. They taught notions of cleanliness, health, economy, and honesty, and devoted themselves especially to education and the founding of schools, and it is not too much to say that the renaissance of the Bulgarian people was in great part a consequence of their efforts. Lately, however, the Methodist mission in Bulgaria has been considerably reduced, while the missions of the American Board have taken a larger development than hitherto. Unfortunately, these missions fell in part into the hands of men who put proselytizing and Protestantizing in the first place and doing good in the second. Their schools were intended primarily for Protestants, and they objected to what they considered secular education. They distributed tracts aimed at some of the doctrines and rites of the National Bulgarian Church, while the Methodists had preferred to open the spiritual eyes of men to the knowledge of the superstitions and errors of their church, and had never pressed them to leave this communion. The present school of missionaries, however, insists on a separation from the Bulgarian Church, and urges strongly the formation of separate Protestant communities. It can be readily seen that of late years such a movement would be very unpopular in Bulgaria, because all Protestants were immediately thought to be unpatriotic. As possessing a separate organization, they refused to pay the voluntary taxes which other Bulgarians contributed to the support of the national schools, and held themselves aloof from the nation as such. This naturally brought the missionaries into disfavor with the leading Bulgarians, and as naturally caused them to rely for support upon the Turkish rulers of the country, who were glad in every way to foster discord and division among the Christian rayahs. It brought about a certain tolerance on the part of the Turks to the American missionaries not hitherto shown, and as a resultant, a certain sympathy on the part of the missionaries for the Turks. Whatever we may consider the faults of these missionaries to have been, they have entirely redeemed them since the beginning of the present war in Turkey by their great devotion to works of charity and benevolence. To these they have given themselves up heart and soul, and what they consider to be their real missionary work has for the past year been entirely at a stand-still.

Dr. Hamlin has given an interesting account of the beginning and the growth of Robert College, the best educational institution in Constantinople, one with which Dr. Hamlin has been from the beginning intimately associated, and one which, although started by missionaries, is now entirely distinct from them. Indeed, Robert College was for a long time an object of distrust among the missionaries of Constantinople, and in some of them this feeling has not yet died out. They opposed it on the ground that it furnishes a secular and not a strictly Protestant education, and that students go there simply for the purpose of getting knowledge which may be useful to them in business, and not for the purpose of becoming teachers and preachers of the Gospel. The results, however, of the working of this institution have been so striking, and its influence has been so great—and will be still greater—on the development of liberal ideas in Turkey that even the greatest sticklers for Protestant doctrines are beginning to be reconciled to its existence. While Robert College gives in one sense a secular education, it is by no means an un-Christian one. Prayers are read daily, and the truths of Christianity in which all sects agree are preached to the students twice every Sunday; but no attempt is made to instil into them the peculiar doctrines of any one sect. It is the greatest missionary institution, in the true sense of the word, which any country has ever erected in the East, and in moral and true civilizing influence is worth the Bible House and all the other establishments of the American Board of Missionaries in Turkey put together. Dr. Hamlin speaks of three schools of thought among the missionaries with regard to education: those who believe that the missionaries should do nothing for education, but should simply preach the Gospel; those who believe simply in

* 'Among the Turks. By Cyrus Hamlin.' New York: Robert Carter & Bros. 1878.

a vernacular education, with all its limitations; and those who would give an English education of a high grade. The failure of the first system is now acknowledged; the second, that of education simply in the vernacular, was introduced by the American missionaries into Turkey, in consequence of a change of system, about 1854, and its results cannot be considered as happy. Robert College in this has the advantage over the American college at Beyrut, and over the new college just started at Aintab. At Beyrut the language of instruction is Arabic; at Aintab it is Turkish. There is great difficulty in finding suitable text-books, and the students being instructed in no foreign language are thereby cut off from still further improvement. At Robert College the principle was laid down that all the studies must be pursued in English; but, in addition to this, each student must study his native language and literature. By this means the best literature of the world is open to them, and the moral and intellectual influence of England and America—which, after all, is the most civilizing influence in the world—becomes more and more widespread in the East. At Beyrut, on the other hand, there is an excellent medical school, such as does not exist in Turkey, and the students who graduate there are thoroughly prepared for their work; but then their progress must stop there. Their teaching has been entirely in Arabic, and unless they find time outside of their duties to learn French, German, or English, they are cut off from making any further advance in their profession.

In saying this, it is not by any means intended to imply that all the schools in the vernacular language should be abolished. The missionaries have done very good work among the Bulgarians and, to a certain extent, among the Armenians, by forming schools, which the native priests and school-teachers have imitated and endeavored to surpass. They have done much for the progress of native education. But schools where the vernacular languages are solely taught should be merely elementary schools; and the moment an attempt is made to introduce a medium or higher education, English should be the language of instruction. Children, especially in the East, learn languages so easily that the teacher's work is greatly facilitated.

With regard to the success or the value of the chief educational establishment at Constantinople, managed by the missionaries proper—"The Home School" for girls at Scutari—it is more difficult to express an opinion. Objections are made to it by various sensible people, on the ground that the education given there—for it aims to be a model of a girls' school of the highest class—is too good for the class of girls who frequent it, who are mostly from the poorer ranks of society. The richer classes of Greeks and Armenians who desire to give their daughters the best possible education do not send them to "the Home," because that school is too Protestant and so entirely under missionary influence. It seems, too, a little absurd to the profane to find a missionary school teaching the piano, drawing, French, Italian, and other accomplishments, with a charge for tuition of £25, when the class of girls who attend it would be much better off if taught to cook, to sew, and to attend to the sick, in addition, of course, to a plain ordinary English education. Women in the East, owing to old and inveterate restrictions, do not yet need as high an education as men.

BARTLETT'S DICTIONARY OF AMERICANISMS.*

IN the third volume of the 'New Voyages and Travels' published by Sir Richard Phillips & Co., London, in the first quarter of the present century, the editor introduces Sansom's Travels in Lower Canada (made in 1817) with a singular apology, to wit, that

"He has preferred to allow Mr. Sansom to speak for himself in his own words, conceiving that this would be more just towards him; and that, as a specimen of Americanisms used by a man of good education, the work would thus be a greater curiosity to those English readers who are not aware of the deterioration which the language is suffering in the United States. For analogous reasons, many opinions of the Republican author are retained, because they will add to the interest of the work, though they may sometimes offend by their coarseness and evident want of discrimination."

Sixty years have wrought no great change in the views of Englishmen of the literary class on this subject. They still look with curiosity on our trans-Atlantic neologisms, real or imaginary, and still shake their heads over the decay of the language in Greater Britain. The least a British reviewer of an American book can do is to point out the traces of its origin, as when the *Athenæum* remarked the other day of Southgate's 'Cross above the Crescent' that "a few Americanisms here and there will sound strangely to the ear of an English reader"; while international spite or prejudice finds a natural vent in damning every unfortunate locution as an American corruption. Few scholars are able to employ the historical method in exposing reckless assertions of the latter sort, and still fewer are interested in so doing. But long before *reliable* found so formidable an apologist in Dr. Fitzedward Hall, Mr. John Russell Bartlett had shown in his 'Dictionary of Americanisms' that Englishmen not seldom denounced, as American, words and phrases which had come over with the colonists and had survived here in respectable usage, while in the mother-country they were still obscure provincialisms, obsolescent sometimes if not obsolete. There remained, however, a large number of undoubted products of the Yankee genius, and to keep pace with the manufacture of these, and so to furnish posterity a key to words and meanings now current but certain to change or to drop out of use, as well as to give the lexicographer a clew to their origin, not only a first, but a second, a third, and now a fourth edition of the Dictionary has been required. We welcome it with grateful acknowledgments for the persistent devotion to a good idea which finds a parallel only in that perennial work of another scholarly and diligent Bartlett, the 'Familiar Quotations.'

The third edition of the 'Americanisms' was closed in 1859, and we have but to reflect on our civil revolution since that date to conceive how large an addition has been made to Mr. Bartlett's vocabulary from this source alone. Thus, we find *bummer; Confederates*, and its military equivalent, *Butternuts; contrabands*, ascribed as usual to General Butler; *copperhead*, defined as "a venomous biped, of Northern birth and Southern tendencies"; *monitor*, for an iron-clad vessel, a name of course in the first instance peculiar to the antagonist of the *Merrimac*, but well chosen, apparently, by Ericsson as indicating the chief use of all ironclads, to keep watch and ward at home; *Secesh; skedaddle*, of which the etymology is laboriously but fruitlessly discussed, etc. We miss in this war catalogue the cant army phrase "to *Blenker*," in the sense of 'to plunder.' *Jayhawker* is, in the preface and *sub verbo*, assigned to the war period, but men not very old can remember that it was first heard during the Kansas struggle, and on page 812 Mr. Bartlett even sets down this word as a nickname of the people of Kansas. To the ante-war period belongs also the new illustration under *let slide*—Banks's famous remark about the Union; and room might well have been made for Caleb Cushing's *man on horseback* (*vidē*. Cæsar), as well as Mr. Seward's *irrepressible conflict*. Passing on to the era of Reconstruction, we find *carpet-bagger*, for which Mr. Bartlett gives well-chosen definitions by the *North American Review*, President Hayes, and Wade Hampton, and an example of its use in a poem by Dr. Holmes on the late Presidential contest; *Ku-klux; bloody shirt; bulldoze*, to which a Louisiana correspondent of Mr. Bartlett ascribes a negro origin both as a word and as a practice! Under this head we miss *swinging round the circle*, and, more singular than that, *Reconstruction* itself, a distinct Americanism. Our recent financial experience has enriched the Dictionary with *greenback*, of which Mr. Bartlett says, "Mr. Chase told the writer that he claimed the honor of adding the term to our vocabulary"; *greenbackers*, the swindling party whose paternity Mr. Chase would doubtless disown without thanks; *demonetize* and *remonetize; dollar of the fathers; inflationist;* and *rag-baby*. Perhaps *in this connection* (if we may venture to employ "a New-England phrase used to such a degree that it has become quite shocking to nervous people," p. 139) we should also mention *Granger* as a politico-economical neologism not overlooked by Mr. Bartlett.

The Addenda contains a list of words both recent and long-established. Among the latter we should enumerate *butter-fingers, corn-balls, cut-and-dried, gang-saw, jack-straws, man-fashion, rocking-chair, Shaker, skin of his teeth, spoiling for a fight, slick a pin;* among the former, *back seat* (why was Andrew Johnson's "back seat in reconstruction" not cited?), *bad egg, big thing, cheese it, Colorado beetle, dry up, flint in, gone where the woodbine twineth* (we miss Mr. Boutwell's *hole-in-the-sky*), *hoodlum, ink-slinger, jack-stone* (of the metal variety), *Oneida Community, oughtness* (coined by the Rev. Joseph Cook), *put-up job, 'rah 'rah 'rah* (the Harvard cheer), *sewing-machine*. To *go to Bungay* is now first recorded, and so is to *pass in your checks*, correctly defined by Mr. Bartlett, though it proved a sad stumbling-block to Prof. Schele de Vere. A *square* vote, *square meal, on the square*, etc., were unknown to the third edition, and so was the non-New-England use of *square* for a block of houses. *Dipper*, a vessel, and consequently the name of the constellation, is of course older than the Dictionary itself, and is in both senses a downright Americanism, but is now first noticed by Mr. Bartlett. In explaining the phrase to *talk Turkey* he abandons his former definition

* 'Dictionary of Americanisms: A Glossary of Words and Phrases usually regarded as peculiar to the United States. By John Russell Bartlett.' Fourth edition. Greatly improved and enlarged. Boston: Little, Brown & Co. 1877.

and illustration altogether, and inserts the well-known story of the Indian and white man from which it is derived. The recent slang use of *shoot* as an exclamation of contempt is copiously illustrated. To sell *short* is apparently an innovation on the Street. Another cant term among brokers, *point*, is correctly defined by Mr. Bartlett to mean private information about stocks, etc., but he omits that other meaning which can best be expressed as the "unit of change" in the market rate of any given commodity, whether gold or cotton; it is not, at least as a rule, synonymous with per cent. To *claim*, in the sense of assert or profess, "is not found in the dictionaries," and is now newly inserted, but it was so used long ago—we have met with it in books published in the thirties—and it is now so common among writers of all classes in England that we should expect to find it a parallel growth on both sides of the Atlantic, or as likely an Anglicism as an Americanism. *Reliable*, also new to this dictionary, is, as Dr. Hall has shown, as old as the century, and probably Coleridge's invention. A third interloper, to *interview*, has here no date attached to it. We incline to think it first appeared in these columns, but, apropos of this, on p. 209, vol. x. of the *Nation* (March 31, 1870), we ceded our claims to priority in favor of 'Hall's Chronicle' (1542), where the verb was said by the *Pall Mall Gazette* to have been used transitively. The remarks on *guess* seem to us less satisfactory than those in the third edition. That our use of the word, even when we can substitute "think" for it, still has an immediate reference to "conjecture," is shown by the fact that we might as naturally substitute "reckon" or "calculate." Our ejaculatory *well!* receives separate attention, and a flood of light from Mr. Lowell. *Gerrymandering* is enlarged upon and illustrated by a cut which must, we think, have done duty in Professor Ware's paper on Proportional Representation in the *American Law Review* for January, 1872. This paper might in any event have been alluded to. *In-ty*, said to have been used in New England sixty years ago for 'certainly,' 'indeed,' is surmised to come from French *entier* (Irish, *entirely*). Prof. Allen, in 'Slave Songs of the United States,' reports the use of *enty?* in the Sea Islands, "used like our 'Is that so?' in reply to a statement that surprises one." The same author suggests a Huguenot origin for some other negro corruptions, but does not propose *entier* for this.

It remains to mention a few Americanisms conspicuous by their absence from Mr. Bartlett's pages. To *weaken*, *i. e.* 'to grow weak,' has no little vogue in the newspapers of the day. When Col. Forney says of his *Weekly Press* that it is the "*newsiest* paper in the country," he shows his familiarity with reporters' English. A publisher's paper-dealer assures him that his stock has only rags *into* it. *Dodgers* are hand-bills distributed in advance of a "great moral show." The boy who throws prize candy and magazines before you in the cars is said to *lap* them. (Similarly, the inmates of a sleeping-car at Pittsburg the other day were turned out by the porter for the reason that it had to be *shopped*, *i. e.*, sent to the repair-shop.) A *jack-screw* is in England, we believe, known as a *screw-jack*. The Beecher trial has left some lasting, if not indelible, marks on our phraseology. *True inwardness* is used in the fifth report of the Co-operation Committee of the American Library Association (see No. 12 *Am. Library Journal*, p. 429), and *step down and out* and *all that the name implies* and *ragged edge* are heard every day. *Chromo-civilization*, the invention of the late J. R. Dennett, confessedly supplied a gap in our terms of precision. Greeley's *Go West* is a school-boy's word for "quit!" Grant's *fight it out on this line* is proverbial. Mr. Bartlett owes many of his accessions to Bret Harte, but *rise to explain* is not among them. Mr. Grant White's *heterophemy* perhaps deserved a place on his list. Under *swap* we might have looked for Mr. Lincoln's advice about swapping horses while crossing a stream; under *spoils*, for Marcy's "To the victors belong the spoils." There are many applications of *fix* cited, but *fixing things* and *fixing primaries* are wanted. The *machine* is also ignored; and so are *war-horses* and *favorite sons*. Johnson's *My policy* is not more fortunate. Finally, in the phrase "he has a bad *record*," we use, and use frequently, a word incomprehensible to Englishmen without explanation, and which ought to be noted in a fifth edition.

A few words by way of criticism. Mr. Bartlett has not repaired two original defects in his plan: he has not been uniformly careful to give the exact date of the periodicals from which he quotes (as Littré has done so punctiliously in his Supplement), and he has not, what was quite practicable, appended a list of the works cited, with date of first publication. Without these aids a foreigner finds it impossible to discriminate between obsolete and living Americanisms, and the value of the Dictionary to the historical lexicographer is greatly diminished. We conclude our rambling remarks by expressing our regret that the present edition of the 'Americanisms' is markedly inferior to that of 1860, the last preceding. Any one who will take the trouble to compare the two will perceive a great falling off in paper and typography, and it might be inferred that the publishers had lowered their notoriously high standard, if we did not know from other examples that the art of book-making in Boston has, since 1860, suffered a serious decline. We hope Mr. Justin Winsor's proposed University Press may become a reality and do something to restore and maintain the old standards.

Mirage. By George Fleming, author of 'Kismet.' (Boston: Roberts Bros.)—We had occasion, some months since, to speak of 'Kismet' as a clever and promising novel, and we are happy to be able to say that the author of 'Kismet' has redeemed the pledge of that work with even greater promptness than was to be expected. 'Mirage' strikes us as very clever indeed, and as a decided advance upon its predecessor. Its faults are the same—excessive slightness of subject and an unbusiness-like way of telling the story, which is put before the reader too much by mere allusion and rather redundant dialogue—but they are much less striking. On the other hand, the merits of the book—great charm of description, a great deal of fineness of observation, a great deal of wit in the conversations, a constant facility and grace of style—these good points are decidedly more noticeable. Like 'Kismet,' 'Mirage' is a slight love-story interwoven in the account of a journey in the East. In the former tale the author set her characters afloat upon the Nile (we say "her" characters, for, in spite of the name upon the title-page, the tone of these pages is irremediably feminine), and in the present performance she conducts them on horseback through the charming incidents of a tour in Syria and Palestine. A large portion of her narrative is given over to description, which is always very well done—very vivid and real; so that the book comes under the perilous head of that class of literature which is vulgarly known as "scenery novels." But she escapes the danger of dulness by the success with which she usually renders a fresh, personal impression of the country. Some of the pictures in these pages are very charming indeed, and we should like to have space to quote them.

A more serious danger with the author of 'Mirage' seems to be a disposition to content herself with altogether too slender a dramatic pivot. The *donnée* of the present tale is a very insubstantial foundation for a long story. There is a Miss Constance Varley, who has been invited to travel in Syria with Mr. and Mrs. Thayer. She is in love with Denis Lawrence, supposedly "unbeknown," as the comic writers say, to the gentleman. She has left him in America, but he turns up unexpectedly at Damascus, and proves also to be in love with her. The young lady has another devotee in the person of Mr. Jack Stuart, who has been travelling in her company, and for whom she can bring herself to entertain no sentiment more tender than friendly esteem. But Lawrence supposes that she is in love with Stuart, and therefore, though he spends much time in sitting with Miss Varley, in great intimacy, among the Damascene orchards in springtime, he never declares his passion. The young girl, on her side, is dying of love for him, and yet she gratuitously and unnaturally allows him to rest in his error. He takes an abrupt leave of her, and she then marries young Stuart, while Lawrence (who is a very clever artist) paints her portrait from memory, and gives it the title of "Mirage." Even if a larger amount of motive were attributed to Miss Varley's conduct, the incident would be rather slight for the author's purpose; and, as the case stands—the reader being quite unable to conceive why she should not take the simple and natural course of resenting, almost with indignation (a highly probable impulse in a girl, given the circumstances), the imputation of being "engaged" to Stuart—as the case stands, we say, the theme is reduced to the level of one of those little romances which adorn the weekly "story-papers." The heroine is very gracefully sketched, though the author is to a certain extent guilty of the regrettable tendency, common among American writers of fiction, of making her utter those "smart" comicalities which are the note of the "lady-correspondents" of certain journals. The prosaic, yet manly, personality of the accepted lover is very clearly indicated; but the æsthetic young man who fails so awkwardly to come to an understanding with his mistress has a rather shadowy and insalubrious air. Very noteworthy is the partiality of American story-tellers for æsthetic heroes. The usual English novelist, desiring to provide a heroine with an interesting and inspiring suitor, picks out a brilliant young man of affairs—a rising young statesman or a prospective commander-in-chief, a man of action, in short, of some kind. The American narrator, on the other hand, is prone, less gloriously, to select an artist, with a "sensitive mouth." The secondary figures in

'Mirage' strike us as the more successful, and they abound, indeed, in clever touches. In especial, the author says very good things about them. The sketch of the young Oxford neopagan, Davenant, is really brilliant; and very good is the English family, the Vaughan-Smythes, encountered by the Sea of Galilee, who are so eager to partake of the fish of its waters, and among whom the mater-familias remarks that in travelling in the Holy Land she makes it a point of conscience to have a *Christian* dragoman! With so much that is agreeable and clever, 'Mirage' strikes us as the work of a person who might write a better novel yet, and we should be curious to see the result of her attempting to tell a story pure and simple—a story which should not be at the same time a record of reminiscences of travel. She has a delicacy of observation and a certain liberty of mind which might go far; the present book is infinitely fresher and wittier than ninety-nine-hundredths of the novels periodically emitted by the regular group of English fiction-mongers. But, even if the author attempts nothing else or nothing different, 'Mirage' will remain an eminently readable story.

Gerrit Smith: A Biography. By Octavius Brooks Frothingham. (New York: G. P. Putnam's Sons. 1878.)—Perhaps no body of men in modern times has presented more completely the type of the Hebrew prophets than the American Abolitionists when, a generation ago, they were resolutely urging the country into a course in which cool-headed statesmen could see nothing but ruin, but which, in the result, did rid the nation of a monstrous incubus In this remarkable group of men nothing is more remarkable than the variety of phases of individual character and abilities to be found among them. There was a certain monotonousness in this unceasing and unsparing assault on the institution and on everything that defended it or apologized for it; but, withal, there was an astonishing variety in style and in temper. No two men (or women) out of the whole number could be pronounced alike.

Of them all there was, perhaps, none more completely individual than Gerrit Smith, taking him as he was by nature and as he had been made by exceptional circumstances. Perhaps it may be said of him that the most individual thing about him was his individuality itself. That is, his mind was not in itself remarkable for power or acuteness. His conclusions could not command assent for any recognized supremacy of intellect which imposed his views upon his followers merely because he held them, as with real intellectual leaders like Webster, Calhoun, and Garrison. Nor, although an effective speaker, did he possess the wonderful persuasive power of Clay or Phillips. But he was completely independent, so far as it is in the power of any man to be so, and came to conclusions—whether logically and wisely or not—which were, absolutely his own, derived, too, quite as much from his sentiments as his reasoning powers. All these men were independent; but with Gerrit Smith independence of conviction was, it seems to us, a larger portion of self than with any of the others.

Add to this a social position more nearly akin to the baronial than perhaps that of any other person in the Northern States. In the admirable and discriminating discussion of his character in the closing chapter Mr. Frothingham notes (p. 375) the demoralizing effects of his generosity upon the community in which he lived. "His negro colonies wasted away; his runaway slaves came to no good in Northern cities; he ruined his beloved Peterboro by excessive indulgence, doing so much for the villagers that they became quite incapable of doing anything for themselves. His generosity dried up the sources of public spirit and made men positively sordid." Peterboro and Gerrit Smith were, to be sure, an unusual instance. But is not this always the case in this country where a single man is richer and more eminent than all his townsmen? An American village cannot afford to have a lord of the manor, even the wisest and most public-spirited.

It was Mr. Smith's individuality that made his Congressional career—as so many judged—a failure. At the height of a tremendous struggle, as parties were then, a man could not be independent without damaging his own cause. The judgment was perhaps pardonable then; but at the present day, when there are no party issues at all, it is this party despotism that ruins our politics. Independents like him would be of incalculable value now, while parties are looking around them for something to fight about. This episode of Washington life gives occasion to one of the pleasantest pages in the book, that in which his hospitality at Washington is described. "Hospitality" is, perhaps, the one characteristic of Gerrit Smith by which he is most widely known, and, as exercised at Peterboro, it occupies another interesting passage (pp. 137–142):

"The hospitalities of Peterboro were revived at Washington. He gave two dinners each week and invited every member of the House. At his table men of all parties and all conditions met and sat down together. The Southerners, in especial, were fascinated by the open-handed, wide-hearted welcome the man extended. . . . His pleasant association with slaveholders exposed him to suspicion and criticism, as similar associations with Pharisees and women who were 'sinners' exposed one who was greater than he. . . . But to their opinions and habits he made no concession. There was no wine on his table; he offered no cigars; he countenanced no rudeness or indelicacy. His guests took him as he was, and were glad to, for his originality was his charm" (p. 217).

We have said more of the man than of the book; but this is the highest compliment that can be paid to a biography—that the author is forgotten, and only the man whose life is written remembered.

*** Publishers will confer a favor by always marking the price of their books on the wrapper.*

PROMETHEUS.

A POEM.

By S. P. PUTNAM.

Price..... $1 25

"The conception is vast, but the author never loses his mental grasp. Some passages indicate great power, and bear the reader aloft into the realm of the pure ideal. The 'stolen fire' glows in every one of the ten books."—*Christian Register.*

"As a meditation on the great problem of duty it is a remarkable production. No single quotation would do it justice; it must be studied and pondered as a whole in order to perceive and feel its power. No thoughtful and aspiring nature, capable of sympathy with a poetical interpretation of the eternal struggle of humanity towards its ideal, can fail, we think, to be deeply impressed by this work."—*Index.*

"Of the author of this poem it may be said he has drawn the materials from his innermost being. It has the charm and force of the eye-witness. It is the solid, sincere material throughout."—*Marlboro Times.*

"The gravest problems of the day are discussed with a depth, originality, and boldness far from common."—*Hudson Pioneer.*

"It is crammed with life, thought, and profound emotion, poured forth, it seems to me, with extraordinary richness and beauty—helpful to real folks who read poetry not for amusement, but for spiritual edification."—*Dr. Bellows.*

INTERNATIONAL REVIEW.

MARCH—APRIL, 1878.

CONTENTS:

Confederate Reminiscences.
By Hon. ALEXANDER H. STEPHENS, late Vice-President of the Southern Confederacy.

Elements of National Wealth. II.
By Hon. DAVID A. WELLS.

The Method of Electing the President.
By Judge THOMAS M. COOLEY, of the Supreme Court of Michigan, and Hon. ABRAM S. HEWITT, Member of Congress from New York.

The Mexico of the Mexicans.
By W. T. PRITCHARD, of Mexico, F.R.S., F.A.S.L.

The Relation of Morality to Religion.
The Modern Symposium. By Prof. A. P. PEABODY, D.D., LL.D., of Harvard College.

Learned Women of Bologna.
By MADAME VILLARI, of Italy.

Modern Love. II.
By Rev. SAMUEL OSGOOD, D.D., LL.D.

Other articles are by Baron Von Holtzendorff, of Germany; Gen. de Peyster and E. C. Taylor, of New York. Recent European and American Books are noticed by George Barnett Smith, of London; Herbert Tuttle, of Berlin; Caspar Rene Gregory, of Leipzig; A. Nongarde, of Paris, and other eminent reviewers.

Price: $1 a copy; $5 a year.

To be had of newsdealers, or sent by mail, post-paid, on receipt of price by the Publishers,

A. S. BARNES & CO.,
111 and 113 William Street, New York.

The great success of his book in Europe is partly due to the fact that it is the ONLY ONE OF ITS KIND from which those who aim at general culture can obtain a sufficient idea of one of the broadest fields of human activity, concerning which every one nowadays is expected to know something.—CHARLES C. PERKINS in the Literary World.

In the new interest in art awakened in this country these volumes ought to be the primer of our artists and art admirers. There is NO OTHER WORK of equal value accessible to the reader, and the numerous illustrations make it easy to grasp the principles and follow the development of the three branches of Art, Architecture, Sculpture and Painting.—N. Y. Independent.

LUBKE'S HISTORY OF ART.

A New Translation from the Seventh German Edition. Edited, with Notes,
By CLARENCE COOK.

Two elegant octavo volumes, with nearly 600 illustrations. Cloth, gilt tops, $14; red cloth, wholly uncut, with labelled backs, $14; half-morocco, gilt tops, $22.

DODD, MEAD & CO., Publishers, 751 Broadway, New York.

The Week.

WE have discussed the present condition of the Fisheries Award question elsewhere. The opinion of the Government on it is not known at this writing, but Mr. Nordhoff, writing to the *Herald* from Washington, says there is a strong probability that an attempt will be made to take the matter out of the hands of the Administration altogether, or to forestall its action by a clause setting aside the provision of the Treaty of Washington which admits Canadian fish and fish-oil free of duty, and directing duties to be hereafter levied on those articles without discrimination, in disregard of the Treaty. The authority for this is to be found in a decision of Judge Curtis, of the Supreme Court, that a treaty with a foreign power is "the supreme law of the land" only in so far as it does not contravene municipal law—that is, that the legislature may make municipal law without regard to it, or rather, that the court could not dispute its right to do so. This plan is, it is said, and with probability, to be produced by General Butler. There is a growing school of statesmen in Washington who study treaties and acts solely for the purpose of discovering in them the materials for tricks of various kinds, and whose principal ambition seems to be to earn for their country the reputation of being the Sharper Nation of the modern world.

Poor M. Delfosse has been interviewed by the *Herald* correspondent about the Fisheries Arbitration, and there is something pathetic in his story. Mr. Blaine's theory is, that Lord Granville cunningly, and for purposes of fraud, forced Mr. Fish into leaving the choice of the foreign arbitrator to Count Beust, with whom in London he arranged the selection of M. Delfosse ("a put-up job"), knowing that the latter would, in order to oblige England, award the Canadians a large sum. A few little additions were made by the newspapers after the speech was delivered, tending to show that M. Delfosse, as soon as he knew the Commission was to sit, threw off all restraint, and announced before going to Halifax that $5,000,000 was the very least he would award, little thinking, doubtless, that the keen eye of the Maine moralist was upon him. The unhappy man now says, however, that he never heard before that anybody had objected to him as representing a dependency of Great Britain; that both Mr. Fish and Sir Edward Thornton had pressed the office on him; that he had accepted it very reluctantly; that they then requested Count Beust to appoint him, and that he acted to the best of his ability and decided according to his conscience; that the condemnation of persons who have not heard the evidence is not of much consequence, but that anybody who supposes he will ever act as arbitrator again is greatly mistaken. This air of innocence will not save him with the pure and good men who suspect him. He must have known, they will say, of the conspiracy under which he was appointed. The only question now is, how much he got for the job. We could pick out a nice little committee of the House and Senate to investigate him.

The week in Congress has been marked by a variety and liveliness which the silver agitation had effectually banished. The chief incident in the Senate has been Mr. Blaine's attack, on Monday, on the Fisheries Award. On Wednesday week the Senate passed a bill directing the Secretary of the Treasury to issue, in lieu of the same amount of the four per cents. authorized by the Act of July 14, 1870, not more than $100,000,000 of registered coupon bonds bearing the same interest, but in denominations of $25, $50, and $100, and redeemable in "coin" after fifty years, and not taxable. The interest is made payable either in coin or in legal-tender notes at the option of the Government. On the same day the notorious McGarrahan claim made its reappearance in Congress, and the Senate weakly granted its Committee on Public Lands permission to send for persons and papers and rehear the case. On Monday, nineteen Democrats voted against a bill supported by one Democrat and twenty-eight Republicans, which directs the President to appoint a non-salaried commission who shall make "an honest, impartial, and thorough investigation into the alcoholic liquor-traffic," primarily with reference to the revenue but also to taxation and public morality. Mr. Conkling secured a place among them for one representative of the traffic. On Tuesday the Senate passed the bill to review Dr. Hammond's court-martial, and one to grant an American register to Mr. J. G. Bennett's polar expedition vessel. On Wednesday, the 6th, the House received the President's veto of the Lumber Court Bill, and seemed disposed to repent the folly it had committed. On the same day it passed the Fortifications Bill, and on Thursday the Deficiency Appropriation Bill. On Friday there was a fine exposure by Mr. Willits, of Michigan, of a scheme of Southern ante-war mail-contractors to be paid twice for doing the same work—once by the Confederate Government and now again by the United States. Mr. Reagan, of Texas, ex-Confederate States Postmaster, alleged that the Confederacy had made no such payments; but Mr. Willits quickly proved the contrary from the rebel archives. Subsequent researches have fixed the identity of a large number of the present claimants with those whom the Confederate Government satisfied. On Saturday Mr. Kelley endeavored to break the force of Mr. Garfield's searching analysis of his political consistency a few days before. He succeeded in bringing out the fact that when his renomination was in doubt, Mr. Foster, of Ohio, gave him a letter to use in evidence that Mr. Hayes was not opposed to having him returned to Congress. We fear it is only too true that, to use Mr. Foster's own words, Gov. Hayes did not "care two cents" about the matter. On Monday, Mr. Hewitt succeeded in making an effective speech urging the abolition of useless embassies in Europe and the reform of the consular service in the interest of commerce, pointing out the contradictions in the President's execution of civil-service reform, and affirming his perfect title to his office.

General Garfield made on Wednesday week, in the House, a very amusing exposure of Mr. W. D. Kelley as a financier, in reply to a very insolent attack of the latter. Kelley has been one of the most violent of the silver-men, and one of the strongest in his denunciation of what he calls the "terrick" by which silver was demonetized. He was, however, himself, when chairman of the House Committee to which the bill was referred, as we showed two months ago, the most strenuous supporter of the demonetization, and made a speech about it in which he declared that silver could not possibly be kept in circulation. This General Garfield brought out amid the laughter of the House. Kelley was also in 1874–5 a fierce supporter of paper inflation, and is now, yet General Garfield showed that in 1868 he voted for a resolution thanking Secretary McCulloch for his policy of contraction, and urging him to persevere in it. In replying to General Garfield he brazenly declares again that he did not know what he was doing when he supported demonetization, and that when he voted for contraction he had not heard from Mr. Stephen Caldwell and Mr. H. C. Carey; that as soon as they wrote to him that he was wrong he looked into the matter, found it was too true, and has opposed contraction ever since. He has also made communistic speeches in Ohio, in 1875. General Garfield has done good service in showing him up, for, even if half fool, half knave, he is really only a specimen of a class. Congress begins to abound with men who, though less noisy than Kelley, have just as little shame and self-respect, and keep their minds just as free of convictions on any subject, and are just as saucy and impudent, and as ready to degrade themselves again when they are found out.

We have more than once pointed out the hollowness of the scheme of an International Conference which was inserted in the Silver Bill to induce European nations to cut off their tails, and make themselves look as foolish as our own silver-men, by trying once more to set up a double standard, or an "optional standard," as the Silver Sage of Cincinnati prefers to call it. The notion that silver and gold can be made to circulate together, so as to do the same work, has been sufficiently exploded by experience to make it now a mere dream of a small band of amiable, hopeful, and over-subtle economists, whose chances of seeing a concerted attempt made to realize their dream grow smaller and smaller every day. The London *Economist* now ridicules the notion that England and Germany, or the Scandinavian States, or even the Latin Union, can be got even to discuss at this date the abandonment of a policy which they have adopted or are adopting after mature deliberation and, in the case of Germany, at heavy cost.

The McGarrahan mining claim, now nearly twenty years old, has come up in a new way. At a hearing before the Senate Committee on Public Lands the New Idria Company, McGarrahan's opponent, put in evidence the claimant's private correspondence touching the manner in which the claim was pushed before Congress. This tends to show that the means used to advance his interest were bribery of members of Congress by gifts of stock, and the employment of all sorts of men "near the persons" of politicians high in office, with a view to securing the influence of the latter. One of the letters threatens a terrible exposure of Judge Black, who is now counsel for the New Idria Company and must be mightily amused by it. There have been so many revelations of bribery and corruption at Washington of late years that this one is hardly likely to excite more than a passing interest. The "charges" will all be denied with the usual protestations of innocence, and there will be an end of it. If the case would serve to fix the attention of the public upon the importance of some measure for keeping such claims out of Congress, the scandal would be hardly matter for regret. So far from the means used by McGarrahan to press his claim being unnatural or due to his exceptional wickedness, they are those which suggest themselves at once to claimants of pertinacity and intelligence who have to do with such a body as Congress. The moral of it all is—remit all claims to the courts. If this had been the law, the McGarrahan scandal would never have been heard of, for his claim was long ago rejected by the Supreme Court. But this, instead of disposing of the claim, only sent the claimant back to Congress.

The bill reported by the Senate Committee on Railroads to effect a final settlement of the matters in dispute between the Government and the Pacific roads, provides for a sinking fund for the liquidation of their debt, to consist, in the first place, of the amount due the companies for transportation up to the 31st of March, 1878, the sum, if it does not reach $1,000,000, to be made up by the companies to that amount. This sum is to be further increased by semi-annual payments by each company of $500,000, until the year 1900. Any balance remaining due from either company at that date is then to be divided into fifty equal semi-annual instalments, to be paid by the companies as they mature. The mortgage held by the Government is to remain in full force, and in case of any default the act is to become inoperative at its option, and its rights as they now exist (which include those of alteration, amendment, and repeal) to come into existence again. The act is to take effect on its acceptance by either the Central or the Union Pacific. It appears from Mr. Stanley Matthews's report accompanying the bill that the principal of the bonds issued to the Pacific roads is, in round numbers, $55,000,000; and that the total interest up to the maturity of the bonds would be $99,000,000 more, making a total of $154,000,000. The plan proposed would leave, after the application of the sinking fund to the debt, a balance unpaid of $51,000,000, provided for by the fifty semi-annual instalments. Mr. Matthews waives in his report all discussion of the legal rights of the Government, urging the view that the question should be treated on both sides as a pure matter of business. Practically it will be seen that the bill contemplates an annual payment of $1,000,000 by each road until 1900, and thereafter half that sum annually till 1950. It is open to the objection that seventy-two years is a dangerously long time for the Government to wait; but how the railroad companies can object to it, it is difficult to see.

A curious correspondence has been made public between Judge Dillon, on the one hand, and Mr. J. P. Usher and Mr. A. J. Poppleton, the attorneys respectively of the Kansas Pacific and the Union Pacific Railroad Companies, on the other. It shows that a suit has been brought in the Circuit Court of the United States for the District of Nebraska by the former company against the latter, under the so-called *pro-rata* clause of the Pacific Railroad Acts, the Kansas Company seeking to enforce certain rights which it claims as a branch of the Union Pacific Railroad. It shows further that the case has been pending ever since January 21, 1875, but that it was not brought to a hearing until November 15, 1877, when it was argued at Omaha by numerous and learned counsel before Judge Dillon and District Judge Dundy. The case was taken under advisement two months, at the end of which time Judge Dillon wrote to Judge Dundy that, inasmuch as his uncle (Sidney Dillon) was President of the Union Pacific Company, he found himself under embarrassment and desired, therefore, to turn it wholly over to Dundy for decision—the circumstance that Sidney Dillon was his uncle having dawned upon him only after the issue was joined and the argument concluded. Two days later he wrote again to Dundy suggesting that, "in view of the vast importance of the cause to the immediate parties and to the people of the whole country," he would suggest the propriety of endeavoring to get Justice Miller of the Supreme Court to sit in the case on a rehearing or on printed briefs. Later on it appears that Justice Miller consented to sit, but that the attorney of the Union Pacific Company declined to accede to that arrangement, and expressed his surprise at Judge Dillon's squeamishness, "in view of the fact that within five years past the Union Pacific Company has been a party to more than a hundred cases pending in his court, some of them of not less magnitude either in respect of pecuniary amount or the character of the questions involved than this, none of which had he ever declined to hear and decide for the reason assigned in this." Mr. Usher intimates in his part of the correspondence that if he can have neither the decision of Judge Dillon nor that of Justice Miller he shall dismiss the cause; and thus an expensive litigation of two years' standing must be commenced *de novo*, in some court where the presiding judge knows who his uncles and aunts are before the trial begins.

During the seven months from the first day of July last to the close of January last the total exports from the United States exceeded the imports by $140,522,066, and during the same time the exports of specie were $4,912,929 in excess of the specie imports, which amounted to $13,829,596. Of the $140,500,000 it is calculated that $40,000,000 were applied to the interest account on American securities owned in Europe, and that the remaining $100,000,000 have been paid with United States bonds and other securities sent back here since the threats of repudiation at Washington became alarming. Had it not been for this return of securities gold payments by the Treasury in 1879 would have been unquestioned. As it is, so strongly have commercial influences been in favor of the accumulation of gold here that, even with the return of United States bonds, bills on London have ruled much below the point which takes specie from us, and gold has accumulated until the New York banks hold nearly $7,000,000 more of it than the amount of United States legal-tender notes in their possession. Since the amended Bland Bill became a law, however, sterling bills have advanced more than half way, from where they started, to the specie-shipping point, the advance of last week having left them at 4.85 for sixty-day, and 4.87 for demand drafts; at 4.89½ for the latter gold will be exported. United States bonds in London have declined little during the week, but, with the exception of one day, have steadily ruled enough below the prices current here to make importations profitable. The decline in gold to 100¾ has quickened the return of

bonds and made strong the sterling-bill market. Gold has fallen wholly because the supply is so large and the demand so small, for the practical effects of the Silver Bill have not begun to be felt (and cannot be until the specie-shipping point is reached in the sterling-bill market), and there is no inclination on the part of speculators to anticipate these effects, inasmuch as the present supply of nearly $40,000,000 gold in the market is too heavy to handle. Silver during the week ruled at 54½*d.* to 54¼*d.* in London. At the close the bullion value of the 412½-grain silver dollar was about 91¼ cents.

The condition of the Eastern question at this writing seems to be this: It has as yet not been quite decided whether there will be a Conference, that is, a meeting of representatives of the Powers for the special purpose of consultation, or a Congress, that is, a meeting of plenipotentiaries with full power to agree to anything; but it will probably be the latter. England demands that the whole treaty of San Stefano shall be submitted to the Congress and placed in its control, and Austria is inclined to demand the same thing, but has not made up her mind, while Germany does not care much about it for herself. Russia, on the other hand, at first refused to submit anything which did not directly affect European interests, but, it is said, afterwards consented to submit to the Congress the question what should be submitted, feeling probably sure of the result, Germany being likely to side with her, and Turkey certain to do so. Andrássy has got the vote of 60,000,000 florins for purposes of preparation; but the Hungarians, who dread any addition of Slavs, have stipulated that it shall not be used for purposes of annexation. England, at the last hour, has bethought herself of taking up Greece as a protégé, and claiming representation for her at the Congress, although she has been snubbing her in the Turkish interest during the war. Had she done this fifty or even twenty years ago, she might by this time have had a vigorous successor ready to take the place of the Sultan in the Levant and hostile to Russia, and won a secure place in the affections of the Turkish Christians. As it is, the proposal will probably end in nothing except making England's failure more conspicuous.

The impression produced in England and Austria by Prince Bismarck's speech is evidently anything but cheering. The inference drawn from it is that in his opinion, at least, Russia is likely to have her own way within the limits prescribed by a fear that if Austria and England are not satisfied with the result the trouble may speedily recur. The *Economist*, too, which preserves that excellent mental balance combined with great shrewdness for which Mr. Bagehot made it so remarkable, comments on the quiet good sense with which Bismarck is able to talk of the situation, owing to his consciousness of German strength. It says:

"Prince Bismarck's speech in answer to the interpellation respecting affairs in the East is full of unpalatable good sense. The advantage of an assured sense of strength is evident in every line of it. England, which knows that she is badly prepared for war, and Austria, which knows that differences of race and policy make it almost impossible for her to declare war, are constantly tempted to gild their inaction by boasting. The successes of 1870 have made it needless for Germany to assert her ability to carry on a second or third campaign, while the unity of her people makes a declaration that she will, at a proper but unspecified time, maintain the interests and the dignity of the monarchy equally superfluous. Prince Bismarck can afford to assign the undisputed usufruct of these rhetorical artifices to Lord Beaconsfield and Prince Auersperg, and to address himself exclusively to the hard facts of the situation. He is the better able to do this, as he is not forced to account from day to day for the movements of a fleet which, like the bird in the story, flits from anchorage to anchorage with provoking, because unintelligible, versatility."

In fact, the inherent folly of threatening the Russian army in Bulgaria with a fleet begins to dawn on the mind of the British public, and the situation of the Ministry, which seemed promising when the fleet was sent into the Dardanelles, has been rapidly deteriorating under the influence of calm reflection. Their position has been rendered all the more embarrassing by the publication of a Memorandum presented by Count Shuvaloff to Lord Derby as early as last June, and which has the air of as honest a paper as ever was written, in which the Czar distinctly states the terms on which he will make peace in case he is not obliged to cross the Balkans, and states with equal distinctness that if he has to cross the Balkans he will ask for more, and will probably occupy Constantinople. The terms in the first case were simply the programme of the Constantinople Conference—*i. e.*, the autonomy of Bulgaria and "reforms" elsewhere; in the second case they were to be indefinitely larger. It appears, therefore, that the ministerial surprise and indignation at the Russian advance on Constantinople must have been largely feigned, and that the abuse of Russia for her bad faith has been simply slanderous. Worse still, it would seem that Lord Derby had been prevented from urging the wretched Turks to accept the first offer by the advice of Mr. Layard, whose career at Constantinople has shown how worthless as a man of affairs a great explorer can be. Our impressions as to the unreadiness of the English army for war—the unreadiness to take the field of even one corps of 35,000 men—are confirmed with much lamentation by all the leading journals.

The most portentous fact which has issued from the war is the alliance—which is, however, considering the condition of Turkey, too strong a word,—the complete subservience of Turkey to Russia. It is now plain that the Sultan has become and must remain, as long as and in so far as he is a European sovereign, the Czar's vassal. He has given up the protection of England, as powerless either to help or harm him, and according to Server Pasha, both in the conversation with a correspondent of the *Daily News* at Adrianople, for which Mr. Layard procured his dismissal, and a subsequent one with a Greek, will hereafter cultivate Russian friendship exclusively. He added that he was still the religious chief of 100,000,000 Asiatic Mussulmans, and as such one of the most powerful monarchs on the globe, and intimated that, despicable as he might seem on the Bosphorus, the Empress of India might find him an ugly customer in Afghanistan, along the Himalayas, and in fact over the whole of Asia. It is only as a tool of Russia, however, that he will ever be formidable. Left to himself, he and the Pashas will give no trouble to anybody until their credit revives and they can get money to equip another army, and it may be safely said that will not occur in our time. The "bloated bondholder" has had a lesson which will last him until the year 1950 at the very earliest.

The French Liberals are making somewhat unexpected progress. The election, after many ballots, of an extreme Legitimist to succeed General d'Aurelle de Paladines as life senator, at first led to the belief that the irreconcilable element had got the upper hand in that body; but subsequent events have put a better face on matters. Three bills have passed the Assembly, all of them of considerable importance in the Liberal programme. One provides that the "state of siege" shall only be proclaimed by legislative enactment, if the Legislature is sitting; that, if proclaimed through necessity during the recess, the Legislature shall be convened within two days afterwards; and that in case of dissolution it shall not be proclaimed at all until the new Legislature meets. Another protects the colporteurs (news-venders) from the arbitrary interference of the prefects, who, before the late election, evaded the law of 1875, which prohibits administrative interference with the circulation of any periodical, by an abuse of the power of licensing the colporteurs. That is, the prefect did not forbid a colporteur to sell a particular paper; he simply showed him a list of papers, and said he could, of course, sell them if he pleased, but if he did his license would be withdrawn from him as a person of defective morality. The remaining bill amnesties all offenders against the press laws against whom prosecutions were instituted during the Broglie-Fourtou Ministry. The Right has fought all these measures with more or less vigor in the House, but their resistance relaxed in the Senate from the first; and a great falling away of the Constitutionals or Orleanists from the Extremists now seems likely to bring the two bodies into a fair approach to harmony.

THE PROS AND CONS OF THE FISHERIES AWARD.

MR. BLAINE has made a speech in the Senate in opposition to the payment of the award of the Canadian Fisheries Commission, containing statements which, if correct, throw some new light on the history of the proceeding. He says that when M. Delfosse, the Belgian Minister, was suggested as the umpire before the *Alabama* Commission, Lord Ripon acknowledged at once that he would probably be objectionable, as the representative of a Power strongly under British influence, and in this view the American Commissioners concurred. It was then settled that if the two Powers could not agree on a third arbitrator within three months, the naming of him was to be left to Count Beust. Mr. Blaine now alleges that during these three months, beginning July, 1873, Mr. Fish vainly endeavored to get Sir Edward Thornton to agree with him on somebody else than M. Delfosse; that Sir Edward suggested this gentleman and that Mr. Fish peremptorily refused to accept him, and that the three months passed by in fruitless negotiation, leaving the choice at last in the hands of Count Beust, the Austrian Minister in London, who named M. Delfosse, in February, 1877. To this it appears Mr. Fish then assented. Mr. Blaine's inference is that Lord Granville was during all this time intriguing for the appointment of M. Delfosse, and that he finally carried his point by the use "of means of influencing" Count Beust "which were not within the reach" of the American Government.

How accurate this story is we are unable to say. Accuracy in "charges" is not Mr. Blaine's *forte*. The fact is, however, that in whatever way M. Delfosse's appointment was brought about, it was made in February, 1877, and was accepted by Mr. Fish, and was known to Congress, which was then sitting, and all the world from that time until June of the same year, when the Commission was organized and began its work. During these five months no objection to M. Delfosse was made by anybody. In fact, any objection to him which may have existed, arising out of irregularity in the mode of his appointment or out of presumed personal unfitness, was waived in the most solemn and public manner by the appearance of the United States by agent and counsel before the Commission and the prosecution of the arbitration for six months. The inference from this is unavoidable, that had the Commission made a small award or awarded nothing, the unfitness of M. Delfosse would never have been heard of from our side. Comment on this is needless among honorable men. That M. Delfosse proved to be but ill-equipped for weighing evidence in a complicated case we pointed out in an article two weeks ago. This might have been suspected long before the Commission met; but if suspected it only rendered double care necessary in the selection of the American arbitrator. He ought to have been the strongest man we could find. The Canadians on their side furnished such a man. Was Mr. Kellogg the best we could do? The truth is that Mr. Blaine and others who are interested in the matter could not employ their time better than in publishing "the secret history" of Mr. Kellogg's appointment. How did he get the place? Whose "man" was he? Was there any good ground for supposing that he was qualified for the work? These are interesting questions, because we make bold to affirm that it was his inability to match the British Commissioner in acting on M. Delfosse's mind that brought about the decision which we are all deploring, and which some of us are bent on disregarding.

The other arguments used thus far in favor of the non-payment of the award are somewhat curious. It is said, in the first place, that $1,000,000 is the utmost we *ought* to pay, or *will* pay; but if this is true, the question submitted to the arbitrators ought to have been what sum, if any sum at all, not exceeding one million, we should pay the Canadians. It is also said that we are not bound by the decision because it was not unanimous, a majority decision not having been expressly provided for in the Treaty. Mr. Blaine cited one or two English law-books to show that under the English common law, where a majority decision is not expressly provided for, either of the litigants may refuse to submit to the award if it is not unanimous. But the practice under statute in, we believe, nearly every State in the Union is to make the majority decision sufficient, which points to the conclusion that the failure to provide expressly for a majority decision in this case was an oversight. So also does the choice of a foreign umpire. If M. Delfosse was not to have a casting vote, what was the use of him? Why not have left the British and American representatives to agree without him, if they have to agree in any case. If a private disputant concurred in the submission of his case to such a tribunal as this, and when the judgment went against him called for unanimity, would he not have considerable difficulty in getting anybody to go into an arbitration with him again? In fact, if this unanimity point is pressed, will it not give the whole arrangement the air of a premeditated failure, for will it not amount to our saying that we never agreed to pay unless Mr. Kellogg consented and fixed the amount? In fact, it is a fair deduction from the position that we ought in the beginning to have proposed to leave the whole matter to an American of our own selection, with instructions to award no more than a million, if any thing; for this is substantially what some of us are now insisting on. At all events, the time to object to the constitution of a board of arbitrators, and to scrutinize the terms of the case submitted to them, is before the cause is tried. Objections afterwards made by the defeated party, however well founded, cannot have much moral weight, and he is lucky if they do not make people laugh.

We gave two weeks ago in detail excellent reasons for considering the amount of the award exorbitant and not warranted by the evidence, and it will clear the ground in the eyes of some people if we acknowledge fully that the United States need not pay a cent if they do not please, that refusal to abide by the decision of arbitrators is not unprecedented, and that in these times five millions are a large sum. We may, too, freely express our fear that the Canadians will never get any money, so that our discussion of the matter may, as far as the present case is concerned, appear somewhat unpractical or useless. But then, in discussing any pending case, even if the result be already sure, one's chances of a hearing are apt to be good, and this award, if it has no other effect, may help to set the better portion of the American people thinking a little more seriously about the influence on the national reputation and national morality which the conduct of Congress in the interpretation of national obligations is exciting and likely to excite. As soon as the war was over and the attention of politicians was turned to these obligations in their most serious form—the public debt—an attempt was made, and powerfully supported, to construe the national bonds in the spirit of a sharp lawyer contending for an unscrupulous client. In the *Alabama* controversy we claimed compensation from Great Britain for certain specific injuries to the property of certain specified persons, proved the damage, and got the money, and all this with as much definiteness and solemnity and publicity as it was possible to put into a litigation. As soon as we were paid, however, we turned around and denied that some of these very persons had suffered any loss or were entitled to any redress, and kept what we had received on their account in the national Treasury, where it now is; and we have defended the performance by quibbles which have shocked the civilized world, and which our own representative at the arbitration considers dishonest. We have during the last five years borrowed some hundreds of millions of dollars *in gold coin*, and solemnly promised through all the proper sources to repay it, principal and interest, in gold coin; which, however, has not prevented us from passing an act, with loud cheers, declaring both one and the other payable in depreciated silver coin, and great multitudes of our people have been led to think this is all right because it is legal. Other cases, too, have occurred, and are so well known that we need not enumerate them, in which we have exacted indemnity from foreign powers for wrongs done to our own citizens, and then coolly refused to pay it over to our clients, so that a claim for indemnity by the United States now excites a by no means complimentary smile in diplomatic circles, and

the American name is becoming more and more associated in foreign eyes with tricky and shady and somewhat brazen transactions.

What we fear now is that the failure of this Canadian arbitration will deepen this disrepute, owing largely to the way in which the award will be repudiated. The way an honorable man might meet such an occurrence would be by a strong protest against the amount, based on the evidence, and an earnest request for a rehearing, and perhaps this is the course the Government may take. But it is hard to see how an absolute refusal to pay on the ground that the decision was not unanimous, or that we did not expect to pay so much, can result in anything but disgrace, and in the utter and final discredit of the "principle of arbitration," to the strength of which we at one time flattered ourselves that the settlement of the *Alabama* controversy would contribute much. All questions of national liability, created by the acts of the nation's properly constituted representatives, are to the people questions of the comparative value of the national reputation and of money. A nation cannot be compelled to pay anything, and its decisions, therefore, in such matters are expressions of its highest morality and of its best aspirations. If what it most of all desires is to get money by hook or by crook, and to keep what it gets, its course is easy enough, and much money can from time to time be made in this way. The opportunities of cheating which are offered to a government are very numerous and easy. If, on the other hand, it most of all desires to play a worthy part in human society, to strengthen the spirit of self-restraint and self-sacrifice on which all civilization is based, and to help to raise the moral plane on which its own people and all peoples live; if it has the noble ambition to win the respect of mankind, not simply as a physical power, but as a moral being, there is no doubt it will have every now and then to submit to some pecuniary loss. It will have to part with money that it would be pleasant to keep, and to surrender advantages to which every smart lawyer would declare that it is fairly entitled, and to give up every now and then the peddler's luxury of getting the best of a bargain.

"WHEELING INTO LINE" ON THE SILVER QUESTION.

A GOOD many newspapers of prominence which have strenuously opposed the remonetization of silver, have, since the passage of the act, begun to make a parade of acquiescence in the decision of the majority, and call for a full and fair trial of "the experiment." "This," they say, "is the people's government, and the people having decided in favor of the double standard and against the mono-metallism of Europe, it is the duty of all to submit cheerfully and work out the monetary problem on the new basis." This is an unfortunate tone to adopt, first, because it is logically absurd, and, secondly, because it is likely to do mischief both by obscuring the issues in the late controversy, and by preventing recourse to proper precautions against the results which all honest opponents of the Silver Bill must still believe to be probable. If they do not still believe them probable, their opposition to the bill must have either been a piece of buffoonery or false pretence.

We did not oppose the Silver Bill simply because we thought it could not be passed. In fact, the probability that it would be passed has been very strong for six months. We opposed it because *if passed* we thought it would sooner or later work mischief, and it is something very like charlatanry for any one who so opposed it to turn round now and say that, since it has passed, the mischief will not ensue. Moreover, the main argument against it was that no popular majorities in its favor could make it work satisfactorily. If strong popular approval was all that was needed to make it a beneficial or harmless measure, the opposition to it would have been very foolish; for that it had this strong popular approval has long been plain. The principal reason for opposing it was that popular support could not make it work satisfactorily, that it dealt with an order of facts which are only to a very limited degree within the control of legislation, and that once silver was restored to its old position as a legal tender for unlimited amount, it passed under the operation of the laws of trade, which are independent of and override those of Congress, and which no bowing to the popular will or "wheeling into line" can stay or permanently obstruct.

All this will appear the plainer if we consider for a moment how little of the problem which this silver agitation presents still remains in the hands of the Government, or within reach of public opinion. The Secretary of the Treasury can coin either two millions of dollars a month or four. We can by "wheeling" doubtless make him coin four, which he would properly as an executive officer do in any case, and he can probably by his manner of dealing with his treasury balances slightly hasten or retard the escape of gold from his hands, in case the price of silver bullion remains below that of gold; but this is all. If the Bland Bill had passed in its first shape, he would have been perfectly helpless from the outset. The Senate amendments have given him a kind of brake with which he may keep his hold on the movement for about two years. In that time he will have lost all control of it. Human nature, working through the laws of trade, which have thus far beaten every government the world has ever seen on all currency questions, will beat him and beat Congress, and "the Mississippi Valley," and everybody else. No legislation, or popular agitation, or newspaper acquiescence, will ever make any commodity pass very long for more than its worth, or secure low interest on bad security, or maintain the credit of a poor pay. These things are beyond kings and people, congresses and parliaments, and it is because they are that the Silver Bill is objectionable.

In the next place, we would invite the attention of "wheelers" to what has already been accomplished in the way of the predicted mischief. The conversion of the six per cent. bonds into four per cent. has been stopped, entailing a loss per annum on the country of about $17,000,000. If this was all it would, perhaps, not be worth dwelling on. The country, it might be said, can stand a loss of this amount per annum, to secure a desirable change in its currency. But the thing which this loss indicates, and of which it is the consequence, is very important. It shows not that we have lost our credit as a nation—for the United States can, of course, still go into the markets and borrow—but that we have lost our position in the money market as a first-class power. We have descended from the rank of a four per cent. borrower to that of a six or seven per cent. borrower. That is, we have passed from the class composed of Great Britain, Germany, France, and Holland, into that composed of Spain, Italy, Greece, Austria, Turkey, and the South American States. We are, in short, now among the repudiators and defaulters. But it will be said: "How can this be? Our obligations have up to this moment been discharged according to contract. Whatever the Silver Bill may threaten, neither our debt nor the interest on it has as yet been paid in depreciated currency, and possibly it never will be; for even if paid in silver, silver may before it is paid rise to par in gold whereas these second-class or seven-per-cent. states have actually defaulted or 'readjusted' already." Yes, but actual default or "readjustment" is not necessary to the loss of credit. Credit depends not only on the faithful observance of contracts in practice, but on the stern repudiation of all *claim to the right of changing the terms of the contract without the consent of the creditor.* A power which ostentatiously claims this right, and legislates in exercise of it, loses its credit before withholding a cent of its debts, because it loses the confidence of lenders. It opens up to them the possibility of loss through the construction of the contract by one of the parties to it, for his own advantage, without regard to the understanding, wishes, or expectations of the other party. They will still probably lend to such a power—we presume even Turkey might still borrow—but they will not lend at low rates of interest, and nobody will lend to it except the speculative class.

There are two aggravations of the matter in our case, which we think are almost without precedent. One is that the alteration of the contract has been accompanied, not by the plea of poverty, which Spain, Turkey, Austria, and Italy have been able to offer, but

by vituperation of the whole capitalist and creditor class as sharpers and knaves, who not only do not morally deserve partial payment, but do not deserve any payment at all. The other is that we have made public proclamation that our Government, though regularly organized and acting within its powers under the Constitution, does not bind the nation, and that solemn legislative acts passed after much and long consideration, and operating as notice to the money markets, may possibly be treated by the country as a common fraud and totally repudiated at the polls. The Act of 1873 demonetizing silver appeared to the outside world a solemn waiver of the right to use silver in the payment of the principal or interest of the public debt, made on behalf of the United States by its constituted authorities; and under that waiver and the explanations of it by the lawful officers of the Government, very large sums have been borrowed in the expectation and belief that they would be paid in gold. The Silver Bill just passed is a formal disavowal of that waiver, a notice to all the world that Congress cannot pledge the nation. This could not but have very serious effects on our credit, even if silver had retained its old value. Coming after a great decline in the value of silver, it seems not only the revelation of a serious defect in the working of our political machinery, but of deep-seated corruption of public opinion.

Let us consider, too, for one moment, what we have to offer to the public creditor and to the money markets of the world in answer to the suspicions thus excited—in support of the assertion, for instance, that the creditor will suffer no loss after all, since silver will be sure to reach the par of gold before he draws his money, or in support of the assertion that we have done him no moral wrong, but have simply resumed the exercise of a just right. It is to be observed here that the Silver Bill is legislation based on prophecy—that is, not on accomplished facts, but on the opinions of a number of persons as to what the facts will be hereafter. Now, if an individual debtor were to ask a creditor to accept a depreciated security in lieu of one he already held of higher value, on the ground that the one last offered would certainly rise, the creditor would most assuredly enquire closely into the grounds of this opinion; he would not be satisfied by being told that a great many people held it; he would want to know what kind of people held it. We may be sure that the creditors of the United States are prosecuting the very same enquiry, though in a slightly different way. They are not in the smallest degree affected by hearing that in "the Mississippi Valley" millions of voters think silver will rise. They ask whether the best judges of such matters, the Americans who have given most attention to the mechanism of exchange—the merchants, bankers, and the most eminent economical writers and students of finance—think so; for if they do, it will of course be to a certain extent an excuse for what appears on the surface a somewhat high-handed proceeding. But the answer unhappily has to be, No; that nobody in America who has hitherto had any reputation for knowledge and judgment in such matters approved of the Silver Bill; that, in fact, such persons to a man disapprove of it strongly, and that the only reason we have to offer for thinking that we are not doing our creditors a great wrong is that "T. W.," Mr. Murat Halstead, Mr. Joseph Medill, the versatile Mr. Kelley, the wild-eyed Mr. Bland, the dexterous Mr. Jones, and a man known as "the Tall Sycamore of the Wabash," and the like, have assured us with loud yells that it will all come right in the end. As these gentlemen are unknown as authorities in the financial world, and as few merchants would probably think of following their advice in a five-hundred-dollar venture, their approval of one of the greatest changes ever made in the currency of a first-class power naturally does not count for much. Nor is our creditors' confidence likely to be strengthened by hearing that the bill passed with little or no debate in Congress.

As regards the morality of the matter, lenders will not ask for our authorities. They will judge us, no matter how much we may squirm or protest, by that of the civilized world, and under that code the nature and obligations of a promise were settled ages ago, and cannot be modified now by any count of noses. No "wheeling into line" can save us from its operation. Legislation cannot change it. Legislation may save a thief from jail, but it cannot make theft anything but theft. So that, unless we are under a strong delusion, the very best service those who have opposed the Silver Bill can render to the country is to stick to their opinions and warnings, and exert whatever influence they have in preparing the country for its worst effects, by procuring State legislation in aid of the gold standard and basing contracts on it, and strengthening the public and private conscience with regard to the obligation of contracts, and the danger and disgrace of a shifting standard of value. This is due to the poor and ignorant even from those who care nothing about the bondholders or the public credit. A fluctuating standard is a curse to a country, for it converts all trade into gambling, and enables, as nothing else does, the speculator to live off the poor. It will never be time to "wheel into line" until the country has gone back to the most stable measure of value, and until the whole people is permeated by a deep and lasting sense of its moral as well as its commercial importance.

WASHINGTON TOPICS.

WASHINGTON, March 11, 1878.

BOTH the friends and the enemies of the Silver Bill in Congress have been surprised at the small effect produced by its passage upon the price of silver, the price of gold, the price of greenbacks, the price of bonds, the price of anything. The supporters of the bill maintained that silver would advance to something near par with gold on the basis of 16 to 1—*i.e.*, to 59*d.* per ounce. On the contrary, it has fallen from 55*d.* to 54½*d.*, and remains sluggish at the latter quotation. The opponents of the bill urged that the price of gold, measured by greenbacks, would advance; on the contrary, it has fallen from 102 to 101. The latter circumstance has been hailed by the silver-men with such gusto that one might infer that they had no other object in life but to improve the public credit, to restore specie payments, and to establish a perpetual equilibrium of the two precious metals. Undoubtedly a considerable number, perhaps a majority of them, are gratified that gold has not advanced, and that bonds have not fallen. Not so, however, the prime movers and engineers of the bill. They are disappointed that the predictions of their opponents have not yet come true, and they are already working up new measures to make them come true. The first of these is the bill of Congressman Buckner to abolish national-bank notes and to substitute Government notes in their stead. "Moderate men" are besought to give their support to this measure upon the same grounds that they were invited to support the Silver Bill—in order to control the movement and prevent "the people" from demanding and obtaining something a great deal worse, as, for instance, a bill to pay the bonds in greenbacks outright. I understand that this is now the great concern of Senator Jones, of Nevada. He fears that unless himself and other moderate men issue greenbacks on the basis of population—so many dollars *per capita*—other and less conservative statesmen will seize the reins of power and issue them on the basis of acreage and square-mileage!

What course will the Secretary of the Treasury adopt in his execution of the silver-dollar law, in conjunction with the other laws on the statute book? He has enough gold on hand, together with his probable receipts during the next four months, to pay one year's interest on the public debt, and it may be safely assumed that he will not pay any silver for interest until he pays all the interest in silver. Under the power which he has to sell bonds for resumption purposes, coupled with the provisions of the silver law, he can reduce the greenback circulation to $300,000,000, putting out silver dollars in place of the notes so retired, within the next four or five months, and this process will be greatly facilitated if the House passes the "long-bond bill" which passed the Senate a few days ago. This bill makes greenbacks convertible into a 4 per cent. 50-year bond—a much more desirable investment than the 4 per cents which the Secretary is now selling. Inasmuch as the Secretary is earnestly in favor of specie resumption, I am surprised to hear that he is opposed to the passage of this "long-bond bill," which would seem to put into his hands powers and resources to that end quite beyond anything in existing laws. There is now so much law on the statute book of one kind and another that the Secretary can do pretty much anything he pleases.

A week ago the pardon of Anderson was confidently looked for, and

prominent Southern men say it would have been granted if any satisfactory assurance had been given that the convict would be removed from office as deputy-collector of the port of New Orleans. There was a great deal of nervousness at the South lest the prosecutions of the Returning Board should bring on a reaction at the North, and this apprehension was so strong at one time that the Louisiana authorities would have been glad to send Wells and Anderson on a triumphal car anywhere across the State boundary, or even keep them at home in any other capacity than that of high public functionaries. But the spectacle of these culprits representing the majesty of the nation, and standing in the places where whatever respect is due to the Federal authority must be paid, was too much for the leniency of Governor Nicholls. Nevertheless, the Southern men say that Wells and Anderson would not have been brought to trial at all but for the provocation committed by the admission of Kellogg to the United States Senate. This, they insist, was the first infraction of the compromise tacitly made with the President's special commissioners last April.

Underneath the gossip and wrangling in the matter of the Returning-Board trials one hears a rumor, now and then, that the question of the disputed Presidency is to be reopened ; and however often it may be pointed out that there is no place for such a controversy to begin, no *pou sto* for the lever to rest upon which is to pry Mr. Hayes out of his seat, this baleful rumor revives and runs through the whole gamut. It has never found the smallest encouragement among the Southern Democrats. Indeed, they would resist any movement of the kind by every means in their power. But latterly it seems to have found lodgment in Republican circles. While there is not the remotest chance that Mr. Hayes can be disturbed during his term of office, the dissatisfaction of the party with his methods of administration is so intense that I have no doubt the majority of Republicans in both Houses would prefer Tilden to Hayes today, and would rather see a Democratic victory in 1880 than to have Mr. Hayes re-elected if he were a candidate for re-election. Failure to get control of the offices is at the bottom of this dissatisfaction among Congressmen, but that is not the whole of it. It is not merely because the President has broken up an old system of distributing appointments that he is held to be the destroyer of the party, but because he has substituted nothing in its place. The President's caprice is considered no better moral foundation for the civil service than a Congressman's caprice, and much less likely to strengthen his party. The President himself does not see the force of this objection as yet, but there are those in his Cabinet who do see it, and who know that the present estrangement between the President and his party cannot last three years longer without producing some political shock violent enough to dispel the complacency which now envelops the White House. It is too late for Mr. Hayes to go back to the old system of dividing the spoils and assessing office-holders for election expenses. Not that the ordinary Congressman would refuse to be placated on that basis, but because so many promises have been made to institute a reform "thorough, radical, and complete" that flesh and blood could not endure the opprobrium of a surrender now; and it would probably be found in the next fall elections that returning were more tedious than go o'er.

Mr. Fernando Wood is courteously obstinate on the subject of his tariff bill. Changes of detail he is willing to make on sufficient evidence, but his general plan of going into the whole subject and making one job of it, instead of taking up a few notoriously bad features of the existing tariff and amending them, will not be abandoned until the House shall have voted it down. I have not seen one member of Congress who thinks Mr. Wood's bill can pass either House, while most members are convinced that the tariff is ill-adapted to the present condition of the country and that something should be done with it. A respectable portion of the woollen manufacturers of New England are ready to agree to a reduction of the duty on their fabrics to 25 per cent., provided they can have free wool. This policy has been strongly advocated by Mr. David A. Wells, who has been here several days. It will probably be incorporated in the general bill and lost, together with some other wholesome changes which might be carried if presented separately. The probable shortage of revenue during the next fiscal year does not seem to be a matter of concern in Congress, and although the President talks about it to his visitors he does not esteem it his business sufficiently to bestir himself with the Committee of Ways and Means in order to obtain new sources of income. Probably the want will be so seriously felt before midsummer that the attempt will be made to restore the duties on tea and coffee, but at present everybody seems to be waiting for everybody else to assume that prodigious undertaking.

ITALY AND THE NEW POPE.

ROME, February 21, 1878.

YESTERDAY, at half-past one o'clock, the new Pope was proclaimed from the balcony of Saint Peter's to the few curious people, scarcely a hundred in all, who were assembled on the vast square before the church. Once more the Italian good sense, that *senno Italiano* of which the nation is as proud as others of heroism or genius, has got the better of passion, and once more it was supported by that proverbial *stella d'Italia—i. e.*, the good luck which abandons the prudent as little as the audacious. The fanatics desirous of having a pope who might preach a new crusade against the Kingdom of Italy and all other liberal states have been beaten, as well as those, more crafty and ambitious, who wished to bring about a conciliation with the modern state in order to rule within this state by means of the opportunities which it offered. It is a man of the middle party who has come out of the shortest Conclave ever witnessed, I think ; and Cardinal Pecci, who has found means to take this almost neutral attitude in the short fortnight of the *sedisvacance*, will most likely assume it in a more decided way still as Pope Leo XIII.

It was Cardinal Pecci, indeed, who pleaded for the Conclave in Rome against the *zelanti* under Manning, Panebianco, and Falloux, who wanted to have it out of Italy in order to show the world that the Church was not free in Rome ; it was Cardinal Pecci who politely declined the protection volunteered by the Catholic ambassadors, thereby manifesting clearly his confidence in the promises of safety given by the Italian Government ; it was he, finally, who appealed to the royal gendarmes to maintain order in Saint Peter's during the *novendiali*. But, on the other hand, it was the same Cardinal Pecci who refused the King of Italy the seat of honor at the funeral of Pio Nono, unwisely solicited by the Italian Ministry ; and although he had his election proclaimed according to tradition on the square of St. Peter's, he maintained the fiction of the captivity by giving his first blessing to the faithful not from the outward balcony of the metropolitan church, but inside the cathedral. It is easy to recognize in this the man who entered Perugia in revolt, in 1860, with fire and sword in order to subject her to his sovereign the Pope, and who, once the town had been incorporated into the Kingdom of Italy, recommended his flock to respect the new Government. Is it to be looked upon as an advantage or a disadvantage for Italy that the *terzo partito* in the Church should thus have won the day ?

With regard to this question there are three parties among the Italian Liberals as well as among the Clericals. One, certainly not numerous but important, group of sincere, energetic patriots, who look at things from a lofty standpoint, sees the greatest bane of Italy in the indolence of the nation, the low pulse of public life. They are convinced that the best tonic, as it were, for their country would be open warfare with the Church, even the fiercest struggle being preferable to the atony now reigning. There is much apparent truth in this view ; but it has the defect of leaving out of calculation the reality of the Italian character, which is pretty much the same on this side of the Tiber and on the other. If there is but little "haine vigoureuse" in the Italian clergy against the Liberal kingdom which has usurped the States of the Church, there is still less fanaticism among the Liberals against that Papacy which by its visible authority prevents the formation of that invisible moral authority which the Protestant believer carries in his own conscience. Even those few who wish that it should be the reverse have a philosophical, not a religious, faith. This being the disposition of both camps, an artificial warfare, such as the election of a fanatic would have caused, would not stir up men's souls. It would create disorder, difficulties of all sorts, in inner and outer politics ; but the dormant spirit of Italy would not be roused by it, because if that spirit is asleep so far as political questions are concerned, it is dead as to religious ones.

There exists in the Clerical as well as in the Liberal army a fraction which sees the salvation both of the religious and political life of Italy in an unreserved reconciliation between state and church. You will remember what I told you some months ago about the indiscretions of that *enfant terrible* of Jesuitism, P. Curci. I do not doubt that he has numerous adherents, not only among the lay believers, but also among the low clergy ; he seems as yet to have none in the higher. The candidate of the party appears not even to have been named in the Conclave yesterday. As for the Liberals, they generally dread a formal reconciliation which would have for its immediate consequence a participation of the Catholics in the political elections. Few are those who believe in the urgent necessity of reforming and reuniting the dissolving Liberal party, even at the risk of a transitory Clerical ministry, and who are convinced that only

the presence of a good number of Clerical members in Monte Citorio (the House of Parliament) could bring truth and vitality into the vitiated parliamentary party life of Italy. I for one do not think the experiment as yet very dangerous; for although the Catholics have on their side numbers, wealth, and organization, they have neither the advantage of possession nor that of intelligence, culture, and governmental experience. This, of course, they would acquire in time, and the utter decomposition of the great Liberal party, split as it is into a dozen fractions, discredited by eighteen years of indifferent home government, would assist them, even if the so-called Neo-guelph fraction of the Liberal party should not actually come to their rescue, as it is probable they would as soon as they saw that the existence of the national kingdom itself was no longer questioned by the Clericals. Now, this branch of the Liberal party is composed of clever and experienced men, all of whom stood behind Cavour as early as 1859 and 1860; they are the real authors of the "Law of Guarantees" which has sanctioned the principle of the free church in the free state. Had this combination succeeded in the election of a conciliatory pope, the ardently-wished-for animation and invigoration of public life would have been attained at once; for the indifference of the Liberals and Clericals by no means extends to the question who should reign in the state or in the church, provided the state and the church be recognized as they are. Now, this result seems to me and to some Liberal Italians important enough to risk even a momentary loss of power, which they are convinced would not occur, as all the Liberal fractions would infallibly unite again in presence of the common enemy, and once united be more than a match for him.

Neither of these extreme parties had the best in yesterday's competition. It was the *juste milieu* which carried the day, according to the wish of the overwhelming majority of the Italians, whether Catholics or Liberals. Leo XIII. will continue to protest on paper against the presence of King Humbert and his Government in Rome, and in fact will avoid all conflict, as Pio Nono did before him. Now, this is precisely the thing peace-loving Italy wished for. There will be neither a struggle about the "to be or not to be" of kingdom or Papacy, nor about who shall rule *in* the kingdom, Catholics or Liberals. Things will remain for a while exactly as they now are, and if religious and political life fall still lower than they are now, why, the nation is barely conscious of it, and the better ones among patriots and priests—those who pursue a higher ideal end for their nation—will once more learn by experience that statesmen, like sculptors or architects, have to work with the materials they have in hand, and attempt no higher plans than they can carry out with them.

It is the feeling that the immense majority of Italians on both sides wished this solution which made it so certain that at the Palazzo Braschi (Ministry of the Interior) people were able to say already before the Conclave had assembled that Cardinal Pecci would be elected; and it was this certitude which created the strange indifference to Pio Nono's death and the election of a new Pope, so striking to foreigners unacquainted with Italy. The few people I have spoken of who desired either open warfare between church and state or a conciliation which would have been the signal for another struggle within the state for influence in it, are an *élite* of highly cultivated minds and noble characters; the mass of the nation knew perfectly that there was no danger of a conflict, and they were determined on both sides to do their best to avoid it. Here it was that they showed their proverbial shrewdness, supported by their habitual good luck. The good luck was that at the death of Pius IX., as at the death of Victor Emmanuel, the Radical party should have been in power. Old General Lamarmora, who was not without a certain dry humor, when he was asked in 1866 who should command, said: "Take Cialdini; he would have the advantage of having no Cialdini at his side." It is in this sense that I consider the presence of the Left in office as a piece of good fortune. The Signori Nicotera and Crispi had been so long passionate republicans and pretophobes, they used, even after having rallied to the monarchy, to speak so loudly of this institution as of a necessary but transitory evil, that maybe, had they still been in the Opposition during these two months, they might have created all sorts of difficulties. Being themselves ministers of the king, they outdid in loyalty all that the most ardent royalists ever had done; and being afraid of losing their places, or at any rate of putting themselves in a very precarious position both with regard to domestic and foreign policy, in case of anti-clerical outbreak at the Conclave, they were more prudent and circumspect, and did more to tranquillize the Cardinal's College than the Moderates would ever have been able to do. They even prorogued Parliament, which has not yet assembled since the king's accession, in order that no indiscreet Hotspur should ask awkward questions about the Conclave—a measure which they would never have pardoned a moderate government for taking had they themselves still happened to belong to the Opposition.

This was a most fortunate circumstance; but there is, besides, merit in the case. Nobody who judges this nation by the standard we are wont to apply to northern and Protestant nations can be just toward it. Good and bad qualities, rapid intelligence and absence of general ideas, spontaneousness and calculation, lie so mixed up and melted together, as it were, in the Italian nature, that it is impossible to separate them; they are quick and impulsive, and naïve and selfish, like children; but they are children who are heirs to an old, accumulated civilization. No doubt they were deeply moved at the king's death; they felt that that man had risked his crown and his family's future for and with them; they saw in him the author of their national independence, which for years had been and still is uppermost in their thoughts; he represented in their eyes the unity of their country, visible and embodied, and he reminded them moreover of the poetical spring-time of their national life. No wonder that they mourned him, and nothing could be more voluntary, more spontaneous than this electric shock of sympathy felt throughout the nation; a movement more intense and more general than any I ever witnessed, excepting the one which prompted France in 1870 to take up arms against Germany. Still, at the same time, the Italians know how to take advantage of their own enthusiasm, and with that rapidity of tacit understanding which is so characteristic of them, and which made them the cleverest conspirators in the world, they converted their sentimental outbreak into a new plébiscite, far more imposing, more natural, more universal than any of those official ones by which, eighteen years ago, the Italian monarchy was founded. So it was at the death of Pius IX. No doubt they were indifferent. The Pope had not shown himself for the last seven years, and was nearly forgotten even by those who had chanced to see him before 1870. The last echo of 1847 and of his liberalism and patriotism had long ago expired; few people had anything to win or to lose by his death; all were convinced that the Papal institution, deprived of all temporal power, was stronger than the man who chanced to be at the head of it, and consequently that the new pope would make but little change. Still, they willingly and wittingly, but without any formal agreement, exaggerated their indifference, in order that all should go off smoothly and no pretext be given for any disturbance. They all wanted to keep in Italy that Papacy which is an Italian glory, and lends, even in its decay, a certain splendor to the country. Consequently, it was important that the Holy College should feel itself free, and that Europe should witness this absolute freedom. So the legend of the captivity of the church vanishes, while the legend of the vitality of the Italian monarchy is acquiring new life. All foreign cardinals and ambassadors must needs confess to the world that the election of a pope was never less influenced or threatened than since the Italians have been the guards of the Vatican; and this is a new title to the gratitude of Europe which Italy has acquired, silently, by doing nothing, but which no eloquence would have brought about so completely. Just so, four weeks ago, was the silent but none the less eloquent plébiscite I spoke of a moment ago—a spectacle calculated to strike the foreign princes and ambassadors with the popularity of the Italian dynasty. It elicited as a consequence a new recognition of the kingdom from the Powers—a recognition infinitely more spontaneous and more valuable than the one wrung from them sixteen years ago. And never, it seems, was the Kingdom of Italy more formally sanctioned both by the opinion and the governments of Europe than just now.

So the extraordinary political genius of this nation is continually repairing the faults committed by their administrative incapacity, just as the French daily make good by their administrative genius the bad results of their political inability. The finances of Italy are far from being in order; her schools, and railways, and roads, and canals leave much to be wished; her poor-laws and her charitable foundations are greatly in the rear of the times; her army and navy are certainly far from being as efficient as they ought to be; her justice is in a deplorable state, and her commerce, her industry, her agriculture develop very slowly; but politically the whole nation shows itself capable of acting like one very able statesman, who achieves great things by cleverly profiting by circumstances, turning every chance to account, knowing how to make himself appear stronger than he is, and conquering finally a position in the world and a security at home which to the closer observer hardly seem justified by reality.

Correspondence.

THE COMMITTEE ON THE CONDUCT OF THE WAR.

To the Editor of The Nation:

Sir: The notice of Benjamin F. Wade, in No. 662 of the *Nation*, contains these words: "He naturally took his place as chairman of the joint Congressional Committee on the Conduct of the War, where his services were *real* and *invaluable*." The Committee on the Conduct of the War was one thing, its method of working was another thing, and both were as bad as they well could be. The committee was often directed by the most violent and ill-balanced of its members, and especially by its chairman. Its policy was simple, and consisted in summoning subaltern officers, and not only inviting but even inciting them to criticise their superiors behind their backs. The testimony taken after the chief battles is often a continuous mass of such mutinous talk as ought to have cashiered the witnesses. Nothing more strongly proves the manly devotion to duty among the officers of the Army of the Potomac than the fact that most of them preserved their self-respect in face of an influence so prejudicial to good order and military discipline.

It followed from its constitution that this committee early became, and ever continued, a hot-bed of political and military intrigue. The leading members had certain officers in mind who were "in favor of a vigorous prosecution of the war," and "whose hearts were in the cause." These commanders were always pushed at the expense of their less popular brethren. Not only had the committee a keen judgment on Washington generals, but a nice discrimination in difficult questions of strategy and tactics. For example, there is nothing in the literature of the Rebellion more ludicrous in its military blunders, or more exasperating for the perversity of its conclusions, than the report on the "Mine," or battle of Petersburg. To say that the performances of the leading spirit of that committee were "invaluable" is to make a statement in opposition to the opinion of every officer who respects the service.

T.

[We take it that in no civil war would the legislative body remain a passive spectator of military events, and its interference could hardly fail to be attended with abuses. A political general like McClellan implied a Congressional chairman like Wade; and when we said that the latter's services were real and invaluable, we had in mind the absolute necessity to the country of such a conduct of the war as should be neither half-hearted nor pro-slavery.—Ed. Nation.]

THE WOOL TARIFF OF 1867.

To the Editor of The Nation:

Sir: A brief history of the conception of the extraordinary tariff of 1867 on wool and woollens will assist in understanding the introduction of a similar arrangement into the present bill. At that time certain parties of great astuteness, representing the worsted and carpet interests, conceived a scheme by which great fortunes would be realized in those branches. It was necessary to secure the co-operation of the great wool and woollen interests, constituting at that time nine-tenths probably of the woollen manufacturing and the *entire wool-growing* interests of the country. The scheme assumed that the worsted (or combing) and carpet-wools, classed as Nos. 2 and 3, were not grown in this country, and that they might be imported at a low or revenue duty without injury to the wool-growers, who were induced by unprecedentedly high, unequal, and nearly prohibitory duties on clothing-wool to favor the scheme, while the clothing woollen manufacturers, being persuaded that duties correspondingly high on woollens (or twice the rate imposed during the infancy of our manufactures) would protect their interests, also favored it. The carpet and combing parties said to the wool-growers, Give us our wools at a low duty, and we will aid you in fixing your own rates on wools of your class; the clothing manufacturers will adopt this plan if they can have correspondingly high duties on woollens. This bargain was struck, incorporated into the tariff of 1867, and now makes its appearance again in a somewhat modified form in the Schedule L of Mr. Wood's bill. This scheme was favored by the very abnormal values then prevailing, which were nearly twice what they are at present. The manufacturers were largely in debt to the commission merchants, their mills were mortgaged, and they were overdrawn on their goods. These interests were very pressing to have the highest possible duties to save them from the impending decline in prices. A large portion of the manufacturers were new men, drawn into the business during the war, and were captivated with the proposed scheme. Some of the older manufacturers opposed it as being sure to result disastrously to the great wool and woollen interests of the country, class No. 1 composing, as beforesaid, nine-tenths of the whole.

The National Woollen Association has been and is managed in the interest of the very small minority above alluded to. The tariff of 1867 imposes the same duty on clothing and combing-wool in the grease, while it lets in combing-wool washed without additional duty, and imposes a double and treble duty upon washed and scoured wools of the first class. (It may be remarked here that the *treble* duty imposed on wools of every class has been *absolutely* prohibitory, no importation whatever having been made.) That tariff assumes that one pound of washed wool equals two pounds in the grease, and one pound of scoured wool equals three in the grease. It is obvious that the interests of the combing and carpet-wools were critically cared for; on the other hand the clothing interest had no such care. The double and treble duties on clothing-wool were intended to be twenty cents and thirty cents, respectively, per pound, and eleven per cent. ad valorem on each alike. By a gross blunder, significant of authorship, the careless wording—grossly careless—resulted in imposing twenty-two per cent. on washed and thirty-three per cent. on scoured, instead of eleven per cent. on each, thus entirely prohibiting the importation of clothing-wools in the washed state, and confining it to the higher-priced greasy Australian wools. The importation of Cape and South American wools, formerly largely used, has been almost entirely suppressed, as the duty on them ranges from sixty to ninety per cent. Double duties were not imposed on washed wools of the second and third class, which paid only the same rate as in grease. About nine-tenths of the clothing-wools imported for the American manufacturer, previous to the tariff of 1867, have been shut out by its operation.

In a late number of the *Nation* Mr. Bigelow alleges that he was present at the inception, etc., of the wool-tariff of 1867, and that it was not the work of the late treasurer of the Pacific Mills, and that the duties on wool were fixed by the wool-growers. This is all quite true. The very ingenious inventor of the carpet-loom needed wool; the same wonderful contrivance which produced the loom also furnished the wool-tariff of 1867. It was a part of his plan, as before observed, that the wool-growers should fix the duties on wools of their class to suit themselves.

Strange at it may seem, Mr. Wood has no doubt that this Schedule L is his plan, and he entertains a most sincere paternal regard for it.

H. N. Slater.

Webster, Mass, March 7, 1878.

LEGAL TIME-KEEPERS.

To the Editor of The Nation:

Sir: Great poets write for all times, but Pope undoubtedly wrote the following lines in his Third Epistle for our time:

> "... man was made the standing jest of heaven,
> And gold but sent to keep the fools in play,
> For some to heap and some to throw away."

The following will also soon be applicable:

> "Blest paper-credit! last and best supply!
> That lends corruption lighter wings to fly!"

I hope you will advocate having the last two lines printed upon the U. S. bonds.

May I here append two suggestions?—1, that when our Congressmen draw their salaries, the silver-men receive silver; the gold-men, gold (even Congressmen have feelings, which it is the duty of the Secretary of the Treasury to respect); 2, that Congress owes it to the country to make silver watches with fifty-five minutes to the hour the only legal time-keepers in the United States, in order that honest labor may no longer be overworked by despotic capital, and that we may all have more time.

Aureus.

Boston, March 4, 1878.

THE PENNSYLVANIA UNIVERSITY AND THE HARVARD EXAMINATIONS FOR WOMEN.

To the Editor of The Nation:

Sir: I have just received the accompanying communication from a lady, a friend of mine. I need not say that I do not admit her charges, or agree to her positions; but what she says is entitled to a hear-

ing, as she is not only highly intelligent and educated, but at one time prepared students for the University of Pennsylvania. Of course I shall not reply. Yours respectfully,

SARAH B. WISTER.

BUTLER PLACE, March 4.

CHESTNUT HILL, PHILADELPHIA, March 3, 1878.

To Mrs. Owen J. Wister:

DEAR MADAM: As I think myself bound to correct some of the statements made in your letter to the *Nation*, published Feb. 21, and as *all* the readers of that letter can be reached only through the columns of the *Nation*, I rely upon your candor and sense of justice to forward the following remarks to the editor, with the request that he will publish them immediately.

In the first place, you observe that "the *preliminary* examination" (for young women) "is but little below the standard of a complete education at the University of Pennsylvania, carrying the candidate in some directions as far as the junior class, in others as far as the senior." Let us see how far this statement can be sustained by the facts, examining in detail what is said in regard to certain branches. As to the Greek, you write that "the Greek course consists of four books of Xenophon's 'Anabasis' and the *first* book of the 'Iliad,' which is more advanced than the Greek required at the University of Pennsylvania, and about equal to what is taken at an elective study in the *senior* year." Now, four books of the 'Anabasis' and three of the 'Iliad' are required for *admission* to our *freshman* class, and constitute the usual work at boys' schools; so no further comment is necessary. Let us, however, suppose that a young woman has taken Greek as an elective study (it is not required of her), and has passed the preliminary examination. We find that the requirements for her advanced examination are the seventh book of Herodotus, or Goodwin & Allen's 'Greek Reader,' from p. 111 to the end, and the *second* and *third* books of the 'Iliad.' So far, therefore, from the *preliminary* examination being "about equal to what is taken as an elective study in the senior year," the preliminary and advanced examinations together are only beyond the requirements for *admission* to the *freshman* class by one book of Herodotus, or its equivalent in the 'Reader.' It is needless to add that the freshman soon makes up for this difference, and there is no occasion to refer to the work done in this "branch" during the sophomore, junior, and senior years.

I have next to notice what you say of the Latin course, which, like the Greek, is elective in the examinations for women, and required, of course, at our University. "The female candidates for the Harvard *preliminary* examinations last June passed a thorough exercise in Latin grammar, translated from Latin into English and *vice versâ*, and were questioned on Virgil ('Æneid'), Phædrus, Justin and Cornelius Nepos, Roman history, and geography." The grammar and translation exercises here alluded to would not be too difficult for any of the upper (or even intermediate) forms in a good school, and the circulars of the local committees state expressly that these papers deal "principally with common forms and average constructions." The applicants for admission to the freshman class have a grammar examination of course, and one in ancient and modern geography. They are also examined on three books of Cæsar, six of the 'Æneid,' four of Cicero's Orations, and the first book of Horace's Odes. Set this against the very easy selections from Phædrus and Cornelius Nepos, and *three* books of the 'Æneid,' which is the work demanded of the young women. Although it was the *preliminary* examination that was weighed against the supposed requirements of a graduate of our sophomore class, our University can easily afford to throw into the balance the advanced Latin course for women, which consists of books fourth, fifth, and sixth of the 'Æneid,' the 'Cato Major' and 'Laelius' of Cicero, the first, second, and third books of Horace's Odes, and the twenty-second of Livy. Thus the school-boy on the *threshold* of our freshman class is, in Virgil, exactly even with the graduate of *both* the Harvard examinations for women, has done as much in Cicero, and one book out of the three in Horace, leaving a balance of two books of Horace's Odes, and one of Livy, on the side of the *advanced* young woman.

Now, if it is unfair to omit the preliminary examination for women from a discussion of the subject, what is to be said of the omission of the *entrance* examination at the University, which, at any rate in Greek and Latin, not only far exceeds in scope the corresponding one for women, but falls very little short of their advanced examination?

Again, the point at which studies become elective at our University is very carefully brought into notice, while the following significant facts are by no means made clear to a person depending upon your article for information:* namely, that the preliminary examination is (see circular of local committee) distinctly pre-collegiate, *no* Greek or Latin being *required;* and that the advanced examination is not intended to be taken as a whole, but the candidate may present herself in any one of the five sections, and is entitled to a certificate if she passes that *one* satisfactorily. Supposing languages to be the section chosen, she may offer *any two* of the following: English, French, German, Italian, Latin, Greek. Thus we find that no Greek or Latin is required at all, both being elective. English is also elective in the advanced examination. The mention of the latter study reminds me to notice your statement that the Harvard examinations necessitate "a thorough and philosophical knowledge of history, ancient and modern, European and American, religious and secular, while the English required of the junior class is only Green's 'History of the English People.'" Looking eagerly into the published data of these examinations to find whence girls of eighteen are to obtain an amount of knowledge that would make Niebuhr and Gibbon hang their diminished heads, I find Freeman's 'Outlines' recommended for general history, while candidates may make use of any manuals they please for English and American history. This is for the preliminary examination, and it may be observed, in passing, that Freeman's 'Outlines' is the text-book of our freshman class. For the advanced examination there is a choice (supposing history to be the subject or one of the subjects chosen) between the history of Continental Europe from 1517 to 1648 and the history of England and America to the end of the eighteenth century. An excellent course of reading is suggested in connection with both examinations, but the Harvard examiners themselves certainly do not expect it to produce the miraculous results above stated. Our junior class has the 'Student's Gibbon' as well as Green's history, and history this year is elective for that class as (we must bear in mind) it also is in the advanced examination for women.

A simple reference to the University Catalogue disposes of the statement that chemistry is a "study not forming part of the academic course of our University." It is *required* in both the sophomore and junior years.

I am aware of Harvard's reputation as first of American colleges, and have no desire to detract from it; and I have felt much interest in these examinations for women, and in every effort to give girls the same advantages as boys; but I cannot allow the University of Pennsylvania to be represented to the readers of the *Nation* as below the level of a good school, without protesting against such a derogatory estimate of its merits and claiming a recognition of its position as a college.

ELIZABETH C. RALSTON.

[Mrs. Wister informs us also, in reply to Provost Stillé, that the catalogue he refers to in his late letter to the *Nation* only appeared shortly before Christmas, and the one she used was that of 1876-7. We have also received contradictions of his statements from other quarters, and subjoin one of them, but we can give no more space to the controversy.—ED. NATION.]

TO THE EDITOR OF THE NATION:

SIR: It is surprising that the Provost of the University of Pennsylvania should demur to Mrs. Wister's estimate of the relative standing of the Department of Arts in that institution and the Academical Department of Harvard University. Although the question at issue involves something more than courses of study set forth in catalogues, the provost appeals to the catalogues, and these amply sustain Mrs. Wister. According to the method of examination known as "Course I." (Harvard Catalogue, 1877–78), the Harvard freshman must study, before entering, all that is required to enter the freshman class in the University of Pennsylvania, with the single exception of one book of the Odes of Horace, and, in addition, the following authors and subjects, which the latter does not require and for which it demands no equivalent, viz.: Cæsar, Book IV.; Sallust, Catiline; Ovid, 4,000 lines; Cicero, four orations and the 'Cato Major'; the 'Eclogues' of Virgil; Herodotus, Book VII.; logarithms; quadratic equations in algebra, plane geometry, history of Greece, history of Rome, physical geography, physical science, and either French or German. A comparison of the two catalogues further shows that the work of the freshman year at Harvard largely exceeds that of any two years in the University of Pennsylvania. In Greek, for example, the Harvard

* [My article for the *Nation* was written for refutation, not for information; for that one must go to the *Penn Monthly*.—S. B. W.]

freshmen have the Orations of Lysias, Plato's 'Apology' and 'Crito,' a play of Euripides, five books of the 'Odyssey,' together with translation and composition at sight, Goodwin's 'Moods and Tenses,' and selections from Grote's 'History of Greece.' To offset this the University of Pennsylvania requires a small portion of Xenophon's 'Hellenica,' the 'Clouds' of Aristophanes, and Arnold's 'Greek Prose Composition'! It would be idle to continue this comparison, which, after all, shows the work of the least advanced portion of the Harvard freshman class, and takes no account of the more difficult work of the advanced sections or of the numerous elective courses in this department. If we turn to the departments of Latin and mathematics, we find a still greater difference. And then the Harvard freshmen are required to study chemistry, physics, and German, which are not included among the studies of the freshman year in the University of Pennsylvania. If, therefore, the question is to be settled by the catalogues, it is evident that the Harvard student begins his college life having at least two years the start of one who is fitted to enter the University of Pennsylvania, and that he gains another year before he becomes a sophomore. Other considerations present themselves, but I forbear, my only object being to confirm Mrs. Wister's statement by showing that the University of Pennsylvania requires a less amount of work for the degree of Bachelor of Arts than is covered by the Harvard curriculum before the close of the freshman year.

R. H. Chase.

Chestnut Hill, Philadelphia, March 9, 1878.

Notes.

Robert Clarke & Co. have in press 'Legal Maxims,' by James Appleton Morgan. The same house have issued, for the second time, a Bibliotheca Americana, or priced catalogue of their valuable stock of books and pamphlets relating to America. It numbers nearly seven thousand titles, classified chiefly under geographical headings, and has a permanent value as a book of reference. Mr. Clarke's catalogues enjoy the same distinction of superiority in this country that Mr. Bernard Quaritch's do in England.——J. B. Lippincott & Co. have in press 'The American Episcopate,' by the Rev. Herman Griswold Batterson; and a new revised and enlarged edition of Hamersly's 'Records of Living Officers of the U. S. Navy.'——G. P. Putnam's Sons announce a translation, by Caroline Tilton, of Edmondo de Amicis's 'Constantinople'; a new edition of Tuckerman's 'Greeks of To-day'; the first volume (1607–1765) of a 'History of American Literature,' by Prof. Moses Coit Tyler; and 'The Bible: What is it?' by the Rev. J. T. Sunderland.——We find in the English papers two announcements of forthcoming publications on the late George Cruikshank: one, an autobiography, expressly illustrated by himself, and edited by his widow, who had been assisting him before his death in the preparation of the book; the other, a biography by Blanchard Jerrold.——The 'Historical Collections of the Essex Institute' (Salem, Mass.), for July, 1877, contains a photographic facsimile of an old MS. plan of the Merrimac River, up to that lake whose name is a terror to the White-Mountain tourist not a "natural speller." Mr. John Gardner, who plotted it, showed a liberal mind in writing Wenepesoce and Winipisocke Pond, and Wenepisocke River. His "Carasaga Mountain" is our Kearsarge.——Macmillan & Co. brought out just on the eve of the Turkish collapse a volume which may now have lost some of its interest, but must always have a high value as contemporary history. We refer to the 'War Correspondence of the *Daily News*,' being the letters of Messrs. Archibald Forbes, J. A. MacGahan, and others, with a connecting narrative to the fall of Kars. This correspondence was incomparably the best of any from the seat of war, and it has been fitly honored in being thus collected and edited and handsomely printed. Another compilation of a different sort issues from the same house—Mr. Henry James, Jr.'s, 'French Poets and Novelists.' All these essays appeared originally on this side of the Atlantic, chiefly in the *Galaxy* and *Atlantic*. Some of them, like those having Turgeneff for their subject, and that on the Théâtre Français, are strictly beyond the scope of the title, but they all exhibit Mr. James's peculiar gift of discrimination in the same direction, and will be read with as much profit as pleasure, and with all the ease of an open page and fair type.——The gratifying announcement is made that the widow of the late Joseph Harrison, of Philadelphia, who by advances on the precious collection of Indian paintings, etc., of the late George Catlin, became the owner of it, intends to present it to the nation.——Elias Magnus Fries, Nestor of Botanists, professor in his earlier years at Lund, and then for more than forty years a most worthy occupant of the chair of Linnæus at Upsal, died on the 8th of February last, in the eighty-fourth year of his age. He survived for a month and two days the one hundredth anniversary of the death of Linnæus, and possibly took some part in the celebration.

—Messrs. A. L. Bancroft & Co., of San Francisco, have undertaken a publication of some interest to the legal profession. They propose to bring out a series of volumes of selected reports (seventy-five in all) containing all cases of any general value and authority decided in the several State courts down to the year 1869 (at which date another series, known as the *American Reports*, begins). The cases are to be annotated when it is deemed advisable, and the selection and annotation are to be done by Mr. John Proffat, the author of a 'Treatise on Jury Trial.' The work of the first volume, which lies before us, is well done, and when the whole is completed, the series will be valuable to lawyers as a sort of encyclopædia of American cases. Professional opinion is, we know, apt to be opposed to the ever-increasing flood of reports poured out from our continually multiplying State courts; but the objection is rather to the publication of official reports, of which courts encourage the citation, than to volunteer efforts of the present kind, which nobody is compelled to buy, and which cannot be cited in court as authorities. It has now become absolutely impossible for any but very well-to-do lawyers to possess complete professional libraries (the number of volumes of official reports, which Kent complained of in 1839, when it was only 539, has now swollen to 2,000), and a well-prepared selection of cases, like that proposed by Messrs. A. L. Bancroft & Co., will, we think, prove a benefaction to the profession at large. The series is to be finished in six years.

—We have received from Mr. Henry Stevens, of London, a copy of his elegantly printed 'Bibles in the Caxton Exhibition, 1877,' of which Scribner, Welford & Armstrong are the American publishers. It is a separate reprint of Class C, Printed Bibles, from the general catalogue, with numerous additions and alterations in the list (the fruit of a tenth revision), and containing, besides the original introduction on the history of printing as illustrated by the printed Bible, twenty-four pages of what our indefatigable bibliographer calls "The Flavour." This tart performance is a minute rejoinder to some ill-natured and ill-informed criticism by the *Saturday Review* of the collection of Bibles at the Exhibition, their arrangement, and Mr. Stevens's part in cataloguing them. There is nothing so unusual in the tone of this criticism as to make one suspect that the *Saturday* was animated by British antipathy to the work of a foreigner; but Mr. Stevens has, in his eccentric fashion, not only paraded his American citizenship on the title-page, but has done still more to shock his censor by the use of such expressions as, "Unless, therefore, I can manage to davenport-brothers myself from these mortal coils of theirs," and "Lest our Scholastikos may attempt to shield himself at the expense of confessing that he had savoyed this whole account of the 'Great Bible' from a contemporary historian," etc. His account of the Great Bible is the strong point of Mr. Stevens's labors on the catalogue, for he is able by a happy discovery to fix the place of publication of Coverdale's Bible, finished October 4, 1535 (the first complete Bible in the English language), the undertaker and possible translator of it, and other circumstances which may lead to still more definite information hereafter. He cites in the original Dutch a passage from Simeon Ruytinck's life of Emanuel von Meteren, in the latter's 'Nederlandtsche Historie' (folio ed., 1614), which states that Emanuel's father Jacob employed at his own cost *een gheleert Student, met namen Miles Couerdal*, to edit an imprint of the English Bible at Antwerp. Owing to the protection afforded English binders by special statute, the work had to be exported to England in sheets and there bound. The entire edition was bought by James Nicolson, of Southwark. This is but a sample of the interest which attaches to Mr. Stevens's bibliographical notes. The book did not need "the flavor" to make it palatable to the large class who can never learn too much about the origin of the art of printing, or who have a kindred taste for the study of the preservation and propagation of the Scriptures in all times, tongues, and countries.

—Mr. Hoar's bill for the distribution of public documents to libraries is a very excellent one; but it is one thing to pass a bill of this kind and another to have it enforced. The law, for example, provides that specimens of all "patterns" struck at the Mint—*i. e.*, coins struck from dies different from those in use as patterns for proposed new issues—should be presented to the various numismatic societies; but the Mint officials have always refused to execute it. The patterns, for example, of this year were all distributed amongst members of Congress and friends of Mint

officials, and were refused to societies, although seasonable application was made in at least one instance. This whole business of mint patterns has been very singularly managed, and to some extent is so still. It has been estimated that in 1859 and 1860 fifty thousand dollars' worth of patterns were struck and disposed of at the Mint, without any benefit to the Government at whose expense they were coined. Copies were not even put into the Government collection of its own coins, which is inferior (except in Washingtons) to the most ordinary collections, while the officials in whose charge it is take no pains to fill its numerous gaps. During Mr. Lincoln's administration these abuses stopped, but of late years they have begun again. For example, numerous pattern dollars struck between 1869 and 1874 have since then turned up and passed into the hands of collectors, none of which appear in the Government collection or were distributed in a lawful manner to numismatic societies, while favored individuals collected at a trifling expense sets which sold at large sums. Over a hundred dollars apiece have been paid for some of these mysterious pieces. We notice in a late catalogue a medal described as a rarity which will no doubt bring a good price. The dies for it were made within two years at the Government Mint, by the Mint workmen, with the Mint machine, but none of the medals are in the Government collection (or were a short time ago), and none have appeared in the Mint salelist or for distribution to numismatic societies. All this seems to show that laws for the distribution of Government favors are one thing and their enforcement quite another.

—The *North American Review* for March–April contains for its most solid article a paper by President Eliot on English and American universities, and for its most sensational what would be called in journalistic "circles" a "Hell" article, by several eminent divines, one of them being a Catholic. Dr. Noah Porter opens and closes the discussion, and has of course forensically a great advantage, but the Catholic disputant, on the whole, comes out of the *symposium* best, for he does not attempt to argue the matter, but settles all doubts by pointing out the fact that the Church has always maintained the existence of Hell. Dr. Porter and Dr. Bellows rather evade the question, which we take to be whether there is a *place* somewhere in which the wicked are eternally punished for their sins by physical tortures. That the consequences of sin are eternal, or that the idea of a just God involves the idea of the punishment of those who violate his commands—all this, it seems to us, is beside the point. To discuss the matter in this way is very much like disposing of the question of a personal devil by pointing to the existence of evil. What we want to know in the one case is whether there is in existence somewhere a supernatural being, filled with hatred towards the whole human race, who occasionally enters a bodily appearance, with hoofs, horns, and tail; and in the other, whether there is a burning and bottomless pit somewhere, filled with brimstone, in which we shall burn eternally if we do wrong. It is evident from the discussion in the *North American* and elsewhere that this belief has lost its hold on the Protestant church, and that there is substituted for it a vague expectation that sin will be followed by some punishment of an indefinite kind. Mr. Frothingham takes part in the *symposium*, and with some violence of language. He of course is not satisfied with demolishing Hell, but makes an assault upon the Christian religion as well. There is no use, we suppose, in deprecating public discussions on fundamental points of creed, but we cannot see what good end they serve at the present day. An eternal life of bliss for the good may be as easily demolished by rational arguments as the belief in Hell; the only difference between the two is that the former is a pleasant, the latter an unpleasant belief. General Garfield contributes an article on the army, mainly made up of letters hitherto unpublished of General Sherman and General Hancock. We fear, however, that these letters are too professional to be interesting. What the people want, unless we are mistaken, just now is not to hear from persons specially qualified to speak by training and experience, but from gentlemen who boast that they do not care for the opinions of experts. We would suggest to the editor of the *Review* that he should bring out a number consisting exclusively of articles of this sort: contributions on Religion by "Bob" Ingersoll; on Specie Payments by Springer; on the Rights and Duties of Ambassadors by General Schenck; on the Higher Education by John Morrissey; and a symposium on Property and Government by Citizens Justus Schwab, Maddox, and George Francis Train, or on the Credit of Sovereign States by Bland and Buckner. We do not care to hear what Sherman thinks about the army; we can see through him without any trouble.

—Among the contributors to the seventh volume of the 'Encyclopædia Britannica' (Boston: Little, Brown & Co.), are Dr. Balfour, Rev. T. K. Cheyne, Dr. Ginsburg ("Ecclesiastes"), W. W. Hunter, Prof. Jevons, Prof. Maxwell ("Diagrams" and "Diffusion"), John Morley, Prof. A. Newton ("Dodo" and "Eagle"), R. G. Poole ("Egypt"), Rev. J. L. Porter. D. Stevenson ("Diving" and "Dredging"), Rev. A. H. Sayce, Prof. R. Smith ("Decalogue"), Prof. Sir W. Thomson ("Elasticity"), A. R. Wallace ("Distribution"), W. Wallace ("Descartes"), Prof. Ward ("Drama"), and many other writers of note. "Egypt," one of the most comprehensive articles that have as yet appeared in the work, would make in ordinary book-form an 8vo volume of about 250 pages. In striking contrast to it are many notices referring to ancient history, some of which are too brief for the poorest of cyclopædias. Such are, for instance, "Diocletian" (twenty-two lines), and "Dionysius, the Younger" (seven lines), which are entirely out of proportion even to such corresponding notices as "Domitian" and "Dionysius, the Elder." "Dido" contains only six poorly-done lines, though the name is not mentioned in "Carthage." The Emperor Decius is neither noticed nor referred to "Rome." Among other names entirely omitted are Decazes, Dolgoruki, Edgar, and Edred, after which the ignoring of such subjects of American interest as Decatur (the naval officers), De Kalb, Dessalines, Denver (though Delaware, Ohio, is noticed), or the District of Columbia is less surprising. It must be remembered, however, that the 'Britannica' lays no claim to anything like completeness as a book of reference, and that its pre-eminence among collective works of its kind consists in the fulness and solidity of its information on a vast number of important topics. Harmony in the tenor of its various dissertations is as little to be looked for as symmetry or completeness. Thus, while Dr. Ginsburg agrees with the Biblical critics of the Continent, where "the attempt to prove that Solomon is not the author of Ecclesiastes would be viewed in the same light as adducing facts to demonstrate that the earth does not stand still," Rev. J. L. Porter, in "Dead Sea," speaks of "historical notices" referring to his subject which "extend back nearly 4,000 years," meaning the legends of Sodom and Gomorrah. The revision of the volume compares not unfavorably with that of the preceding ones. Yet we notice four misspelled names in the half column devoted to Diebitsch: "Polozk," "Yorck," "Newski," and "Kleckzewo," and a large number in the bibliography of "Dictionary," which are, however, more excusable, considering the extent and polyglot character of the article. A general defect of that bibliography, as very often of English catalogues of large collections, is the literal reproduction, without an explanation, of the foreign names of places of publication, as found on the title-pages. Thus in the Polish subdivision, we find, besides "Warschaw," which is not correct in any language, "Warszawa," the Polish nominative form for Warsaw, and "Warszawie," the locative form, though the preceding *w* (*in*), which conditions the case termination is dropped; in the Bohemian, "Praze," the Cech locative form for Prague, also without the preposition; in the Wendish, "Budissen," and "w Budzsinje," in which but few English readers will discover the town of Bautzen in Saxony; and in the Hungarian, "Kassan," which, if correctly printed (Kassán), means *in Kaschau*, and "Budán," which means *in Buda*. In the Slavonic division, the Slovak is erroneously mixed up with the South-Slavic idioms, and the Celtic division is made apparently to embrace the Basque, Lithuanian, Lettish, and Prussian, no separate headings intervening.

CESNOLA'S RESEARCHES IN CYPRUS.*

THIS most interesting book is not nearly as formidable as it looks. In the first place, the narrative proper is not very long, for it ends with page 350, and is in large type and thickly interspersed with pictures, even the so-called "plates" (which, however, are all woodcuts apparently) having their page numeration. Then it is as interesting as the best book of travels one recalls; as interesting as Curzon's 'Levant' or Lord Dufferin's 'Yacht Voyage.' The style is as simple and quiet as the subject-matter is interesting. It is especially delightful to find an explorer relating what he found and how he found it, without setting up exaggerated claims on behalf of his discoveries. General di Cesnola seems to be perfectly aware that neither he nor any of his advisers and informants are quite certain as yet about the value and meaning of his discoveries. That these are not generally of the best times of art; that there are no painted

* 'Cyprus: Its Ancient Cities, Tombs, and Temples. A Narrative of Researches and Excavations during Ten Years' Residence in that Island. By General Louis Palma di Cesnola.' With Maps and Illustrations. New York: Harper & Brothers. 1878. 8vo, pp. xix.–456, and about 200 woodcuts.

vases of the best type, and few statues of Grecian perfectness; and that Cyprus has not given up, and is not likely to give up, any evidence of having contained a great and living school of fine art, our explorer is ready to state. What he has found is an extraordinary assemblage of works of art of interest and value in themselves, and of still greater value from their association. Works of great antiquity and unknown parentage, which from partial evidence he calls "Phœnician," works unquestionably Egyptian, Assyrian, Greek, and Græco-Roman, all found within the few acres explored, and often pell-mell together, form a museum of antiquity which years of study only can fully explain. At the same time the inscriptions discovered, though not the only key to the mysterious Cypriote dialect and syllabic characters, have aided in their elucidation. Of the great possible value of these inscriptions to history and archæology, it is as yet too early to speak.

The story of research and discovery is mingled with the happiest anecdotes of life and manners in Cyprus, and no reader of this volume will be in haste to forget the amusing pair of Turks (p. 221) whose objurgations the too-well-informed giaour overheard and understood, to their confusion and his lasting renown; the description of mule-back travelling in chapter iv.; the account of the lepers at Nicosia, and of the curious "linen-cotton" sect of Christians who name their children Joseph and Abraham, and such other names as are common to Islam and Christianity. The brief allusions, too, to Cyprus under the Crusaders and the Lusignan kings, and the occasional mention of mediæval churches and other remains, lead the curious reader to wish for a supplementary volume of reminiscences. There is one thing which we regret, namely, that General di Cesnola had not with him a sufficient draughtsman. The little views of localities in Cyprus are very poor indeed, sometimes almost incomprehensible, and the reader longs to know how the hillside of Alambra and the cliffs of Kurium actually looked, and what was the promise held out by the surface of that famous field near Dali, and of that other one where the Golgos temple lay concealed.

It was Christmas day, 1865, when our author landed at Larnaka, there was fixed his official residence as United States consul. This town replaces the ancient Citium, though it does not stand upon exactly the same site, and the modern town is as decidedly the chief seaport of Cyprus as was the ancient city. Architectural remains are plainly visible in fields near Larnaka, and a mound—which General di Cesnola thinks covers the remains of a temple—had yielded curious little terra-cotta figures, some archaic in style, but some of a good period of Greek art. All around this mound are tombs, and in the course of 1866 the new consul began to employ his energy and gratify his curiosity by explorations among them, finding in them sarcophagi, earthenware vessels, alabaster jars, and now and then bronzes and coins. Most of the objects found were Greek, and the author is satisfied that these tombs were not earlier than of the fourth century before Christ; but some pottery was found very archaic in character, and some objects of marble and alabaster bearing Phœnician inscriptions. These early and almost accidental discoveries, though of slight importance in comparison with the splendid results of later explorations, are yet characteristic of Cyprus, as Cesnola found it. The works of early and later art were found side by side, and the successive influence of Phœnician voyagers and of Egypt, Assyria, Greece, and Rome are all strongly marked, as passing each in its turn over the universally accessible, fertile and wealthy island. But Citium did not long detain our explorer, whose appetite for discovery was evidently very sharp almost from the beginning. A summer residence near Dali, in the centre of the island, and among those "Idalian plains" and hills where Venus loved to dwell, made easy an extensive exploration of tombs lying near Dali, and forming an immense necropolis of a very early period.

The earthenware jugs, jars, and vases found in these in great numbers showed an endless variety of shape, but the painted decoration upon them was not very varied nor very elaborate. As they stand now in the Museum of Art in this city, by hundreds, they are evidently not Grecian work of any previously known type; and General di Cesnola has not been contradicted in calling them Phœnician, and probably cannot be, although only one vase among them has a Phœnician inscription. This is the pottery of yellowish grey or buff body, entirely unglazed, of medium hardness, and decorated chiefly with concentric rings of black, with some use of red, and occasionally patterns in chequers, plaids, and zigzags, which is chiefly to be found in the Northeast room at the Museum, and specimens of which are represented in plate ii. In one of these early tombs, with this supposed Phœnician pottery, was found that copper bowl chased with figures of women and an enthroned goddess, which has excited so much discussion since its first exhibition in London and afterwards in New York, four years ago. In some parts of the great Dali necropolis the tombs nearest the surface were discovered to be of the Græco-Roman period, with earthenware lamps of late form and design, having Roman inscriptions in a few instances; and it was in these tombs that were found the greater part of that splendid collection of glass vessels which fills the Northwest room at the Museum. The lovely iridescence which invests many of them is not their highest beauty: the charm of their simple and subtle forms is so great that many lovers of classic purity of design will feel that those which are the most nearly in their original translucent state are the most beautiful. This iridescence seems to be the result of a curious process of decay, the glass losing its hardness and homogeneity, and becoming a mass of laminæ of indefinite thinness, having little more cohesion left than so much flaky pie-crust. Some few pieces in this great collection are decorative in original design, and are of singular beauty and value. The amount of Greek or Græco-Roman ornamental glass that exists, above ground, is very small, and the few decorative pieces rank with the best of it, though not equalling in elaborate splendor the few pieces of later Roman glass which such museums as those of Naples and Kertch possess. Underneath these Greek tombs the Phœnician tombs were still found, as elsewhere, and it was evident that new ground must have formed above the early Phœnician necropolis, so deep, in the course of seven or eight centuries, that the Greek colonists, under the rule of the Ptolemies, were induced to make their own interments above them, perhaps in ignorance of what lay below.

It is not stated in which of the Idalian tombs were found those vases, decorated with conventional representations of swans and other aquatic birds, which are now in the Southeast room of the Museum and in the case near the window of the Northeast room. Mr. A. S. Murray's discussion of these, in the appendix, where some of them are represented on page 405, and in plates xiv., xv., and xvi., would be more valuable to the reader if it were made certain that they were found in the Greek or in the "Phœnician" tombs. In the one case their discovery among objects of pure Greek character would confirm strongly his assumption that in Cyprus no living school of pottery-decoration existed, so that what would necessarily be of the sixth century before Christ if found in Attica, might be two centuries later in Cyprus. The forms of some of these vases are also very unusual, and important analogies may yet be traced by this means.

In a limestone hill called Alambra, near Dali, tombs were found excavated in the soft rock, and in these much pottery of a kind not found elsewhere in Cyprus, and almost wholly new to students. These bowls and vases, now in the Southeast room at the Museum, and partly represented in plate vii. and page 408, fig. 28, are all of rather soft and coarse clay, red or black, having a slight glaze, and decorated with scratches made after the glaze and forming rude patterns. Our author thinks them exceedingly old, and probably foreign, perhaps brought into Cyprus by an invading force. Mr. Murray, in his appendix, thinks that antiquity cannot be certainly claimed for them, because of that absence of a natural and vigorous progress in the ceramic arts in Cyprus of which he speaks. Together with these were found rude *figurines* of horsemen, animals, figures of men and women, and among them that curious procession of men, donkeys, and chariots which has been called a child's collection of toys, but which our author says was certainly not found in a child's tomb. Again, in a sugar-loaf-shaped mound in the same neighborhood, tombs were opened in which were found bowls and a vase of green-glazed earthenware, of undoubted Egyptian character. Very little pottery of positively Egyptian type has been found in Cyprus, nor any signs of Egyptian burials. The influence of Egypt over Cyprian art and customs was not, it appears, obtained through colonization.

Golgos, or Golgoi, was an ancient city and seat of the worship of Venus, whose site the Count de Vogüé had identified with the modern village of Athenio. There and in the neighborhood several interesting sculptures had been found at different times. In 1870 some diggers working at their own risk, as it would seem, struck upon that colossal head which forms one of the glories of the Cesnola collection. General di Cesnola, summoned in haste, managed to assume possession of the discovered treasure and to hire or purchase the ground in the neighborhood, where systematic digging was immediately begun. After many statues and parts of statues had been discovered, the site of the great temple was found at last—a building so curious in plan and apparent design, so different from previously-known buildings of classical antiquity, that it may well give to archæologists wholly new ideas both in art and in hagiology.

A parallelogram of thirty feet by sixty, once surrounded by walls of sun-dried brick or some material not more durable than that, and roofed with wood, had contained nearly two hundred statues of stone. These statues were of many different styles. As they stand to-day in the Museum gallery, so and more closely side by side they stood in their original home, the Egyptian figures together, then those in the Assyrian taste, and so on. Along each wall their rough limestone pedestals were ranged, and in the mid space were fifteen double pedestals, each supporting two statues, standing back to back. Was this room indeed the *cella* of a temple; and have we reason to suppose that in other temples better known to fame a similar gathering of statues existed? Was this temple of Assyrian or Phœnician founding; and are we to believe that successive races of conquerors respected it, and added their votive or honorary statues to the previous collection? This is to ascribe Roman indifference to earlier peoples of much greater tenacity in matters of religion.

In 1872, a cemetery near Ormidia, on the south coast, yielded many large and rich vases of the type we have called Phœnician; and in another, near Cape Greco, were found many more Greek glass vessels, among them some of the most brilliantly iridescent, and a number of gold ornaments. These seem to have been the latest explorations made previous to the consul's visit to America, where he spent six months or more arranging, in the galleries of the Museum in New York, his collection, which had been bought by Mr. John Taylor Johnston, and which was transferred to the Museum soon afterwards. That collection remains to-day nearly as Cesnola arranged it in 1873; the glass has been moved to another room, but not differently distributed; and, of the late purchase, only the Kurium temple-treasure has been unboxed, and that is displayed by itself in an up-stairs room, apart from the earlier collection.

The scene and circumstances of the Kurium explorations have been often and recently described. They are romantic enough to add fresh interest even to the precious discoveries themselves. The resolute digging down beneath the broken mosaic floor, to a depth of twenty feet beyond what former treasure-seekers had reached, must have required a good deal of courage and of that sort of instinct which belongs to the born explorer; for what but foundations, pottery, and broken inscriptions could have been looked for? The finding of the treasure-vaults of a temple, half emptied indeed but still rich in precious things, must have been about the last thing in our explorer's mind. The treasure, though not forming in itself a very extensive collection of antique jewelry and precious objects, is yet worthy of all the praise that has been lavished upon it. Nothing can be imagined more valuable in their way than such pieces as the crystal bottle with gold stopper represented on page 325, the necklaces in plates xxii. and xxiii., the larger Assyrian engraved cylinders, the fine Greek signet No. 1 of plate xxxix., or even the great covered vase engraved in plate xxix. Mr. King's appendix treats well of the engraved gems. The other pieces bought by the Museum a year ago cannot be exhibited until more space is at the disposal of the Museum; space which can only be obtained, it appears, by the threatened banishment of all the collections to the Central Park. When the whole Cesnola collection shall be on view together, will the discoverer make, or aid in making, a thorough catalogue? If so, we shall be well indemnified for what we miss in this book—precise indication of localities where objects were found, and a complete index.

St. Clement of Rome. An Appendix containing the newly recovered portions. With Introductions, Notes, and Translations. By J. B. Lightfoot, D.D., Lady Margaret's Professor of Divinity, Cambridge, Canon of St. Paul's. (London: Macmillan & Co. 1877.)—About two centuries and a half ago the Epistles of Clement of Rome were first published from the Alexandrian MS., now in the British Museum. From the First Epistle—which alone is considered genuine—the last leaf, comprising about a tenth portion of the whole, was missing. About two-fifths of the Second Epistle, it is now ascertained, were also wanting. Near the close of the year 1875 both Epistles were published entire from a manuscript which, up to that time, strange to say, had lain unobserved in the library of the Most Holy Sepulchre in Constantinople. A few months later the catalogue of the late M. Jules Mohl of Paris revealed the fact that in this collection was an ancient Syriac version of both the Epistles. It was purchased by the Cambridge University. These discoveries have awakened the most lively interest among scholars. They led to the preparation of new editions of Clement by Hilgenfeld, and by Gebhardt and Harnack, in Germany. Professor Lightfoot has chosen to prepare an additional volume in the form of an Appendix to his valuable edition published in 1869. This new work contains, first, an account of the newly-found documents, with critical remarks upon the text of the Constantinopolitan MS., and the characteristics of the Syriac translation; second, a dissertation upon their contents, especially upon the last pages of the First Epistle, which, as belonging to the first century (A.D. 96 or 97), is of extraordinary interest; third, the documents themselves in Greek, with an elaborate commentary; and, fourth, Addenda, consisting mainly of discussions of the text. The volume evinces in every part a thorough and conscientious scholarship, and a comprehensive knowledge of Christian antiquity. The main points to which Professor Lightfoot calls attention in the preliminary essay are as follows: 1. The light that is thrown on the secret of Papal domination. The Church of Rome, at that early day, gives advice to the Church of Corinth in a tone which, with no very great change, might pass, and eventually did pass, into a voice of authority. 2. The link of connection which the new portion of the Epistle supplies with the earlier history of the Roman Church, since the bearers of it must have had a direct knowledge of the relations of Peter and Paul, and of events in the latter part of the Apostolic age. 3. The *personnel* of the Epistle, it being probable that the bearers of the Epistle, and Clement himself, were of "Cæsar's household." Dr. Lightfoot thinks that Clement was a man of Jewish parentage, a freedman, or the son of a freedman, belonging to the household of Flavius Clemens, the cousin of Domitian. 4. Interesting references are furnished to the persecution of Domitian. 5. The liturgical character of a part of the fragment appears to indicate that a fixed though unwritten form of prayer was beginning to be used in Christian worship at Rome. 6. Something is contributed to the history of doctrine. The genuineness of a passage quoted by Basil from Clement, relative to the Trinity, which has been heretofore doubted, is now established. 7. Light is thrown upon the canonical reception of the First Epistle. It was, probably, read in Corinth and other churches. Hence it was added, with the Second Epistle, which came to be considered genuine, to MSS. of the New Testament. Then, in some cases, its place was changed, and it was put along with the Apostolic Epistles—as in the Syriac version (the Peschito).

On the whole, this discovery, though of less importance, of course, than the work of Hippolytus (published in 1851), and the Codex Sinaiticus (published in 1862), is still one of the most interesting of the additions which have been recently made to our knowledge of the ancient church.

Primer of Pianoforte Playing. By Franklin Taylor. (New York: D. Appleton & Co. 1878.)—We have often wished that some competent person would undertake the task of translating Friedrich Wieck's admirable little book on 'Clavier und Gesang,' a work of immense value to the music-teacher and the private student on account of the many sound maxims and suggestions scattered through it, the fruits of the life-long experience of one of the most successful teachers that ever lived. Franklin Taylor's little manual goes some way towards making the want of such a translation less felt, although he writes in a simple scientific spirit, while Wieck in his work appears in the character and with the manner of a reformer, and is, therefore, more impressive. The 'Primer' contains in the space of 125 pages a good deal of information not commonly given in instruction books; and while there are few teachers, even, who could not learn something from it, it will be found especially adapted to the wants of pupils who do not have access to the best teachers. An elementary manual for the raw beginner in music it is not, for it is presumed of the pupil "that he can already play well enough to desire to play better." The first section treats of touch, of each of the two kinds of which, the staccato and legato, the author makes three subdivisions, suitable respectively for rapid passages, melody, and accompaniment, and the rules which he gives for the attainment of these differences in touch are minute and clear. Instructors generally pay too exclusive attention to fingering and time, to the neglect of touch, and hence the great number of performers who either drum on the piano or touch the keys so superficially that one might imagine a little bird was hopping about them. A full, rich tone which drains the capacity of the piano to the dregs is rarely heard. A loud tone is common enough, but a loud tone is not synonymous with a full tone.

Several columns would be required were we to notice all the important points discussed by Mr. Taylor. We must content ourselves instead with advising every pianist to get a copy of the primer and read it for himself. The last section, on ornaments, cannot fail to be useful, especially to those who are fond of playing the old music written for the harpsichord

and clavichord by Bach, Handel, and others, which, as Mr. Taylor points out, required a great many more ornaments and grace-notes than modern music, because those old instruments had not the same power of sustaining the sounds as have our pianos. The chapters on "fingering," "phrasing," and "special difficulties," are also good, and deserve study. What, for instance, could be better than this rule: "The fingering, once determined on, should be scrupulously adhered to, as nothing tends more to produce uncertain execution than the habit of fingering the same passage differently at different times"? We cannot, however, share the author's aversion to putting the thumb on black keys. It should not be thus used unnecessarily, but, if anything is gained in convenience by doing so, use it by all means. Rules should be adapted to fingers, not fingers to rules. The only serious fault we can find with the Primer is the adoption of the English system of fingering in the numerous (172) valuable examples in musical type which enrich it. It is time that this nuisance should be abated. Nations which have done so little for the advancement of music as England and America should not stubbornly adhere to a practice which only tends to make the execution of musical compositions still more difficult and perplexing than it already is. While there is no advantage in the English system, it often leads to inconvenience, because, in reading at sight, the sign for the thumb is apt to be mistaken for a double-sharp.

A NEW VOLUME IN THE AMATEUR SERIES.

On Actors and the Art of Acting.

By George Henry Lewes. 12mo (Amateur Series).

Previously published in the Amateur Series (12mo, cloth, uniform):
THORNBURY'S LIFE OF J. M. W. TURNER, R.A. $2 75.
WAGNER'S ART LIFE AND THEORIES. $2.
MOSCHELES'S RECENT MUSIC AND MUSICIANS. $2.
CHORLEY'S RECENT ART AND SOCIETY. $2.

JUST PUBLISHED.

The Honorable Miss Ferrard.

16mo (Leisure-Hour Series), $1.

A NEW AND ENLARGED EDITION OF

The Laws of Short Whist.

Edited by J. L. Baldwin, and A Treatise on the Game, by James Clay. New American from the latest English edition.
18mo, $1.

Adopted by the leading English and the following American Clubs: UNION CLUB, of New York; CHICAGO CLUB, of Chicago; MARYLAND CLUB, of Baltimore; SOMERSET CLUB, of Boston; ST. JAMES'S CLUB, of Montreal; UNION CLUB, of Boston; UNION CLUB, of Brooklyn, etc.

HENRY HOLT & CO., New York.

NOW READY.
THE
American Exporter
FOR MARCH,
CONTAINING THE ONLY FULL REPORT OF THE NATIONAL EXPORT CONVENTION AT WASHINGTON, FEBRUARY 19 AND 20.

It has received the highest commendation—official, commercial, and journalistic—as the organ of the EXPORT TRADE of the United States. Its value to American manufacturers and the importers of foreign countries may be learned from an examination of any one of its issues.

Single copies, 20 cents; Subscription, $2, post-paid.
ROOT & TINKER, PROPRIETORS,
86 Duane Street, New York.

F. W. CHRISTERN,
Foreign Bookseller and Importer,
77 UNIVERSITY PLACE, NEW YORK.
The principal publications of Charpentier, Didier, Didot, Hachette, Levy, etc., on hand; also, complete sets of Tauchnitz's collection of British Authors and Teubner's Greek and Roman Classics. Catalogues mailed on demand. European Periodicals received weekly.

SECOND EDITION NOW READY.

LÜBKE'S
History of Art.

A new Translation from the Seventh German Edition.
Edited, with Notes,
By CLARENCE COOK.
Two vols. 8vo, nearly 600 illustrations. Cloth, gilt tops, or uncut, $14; half-morocco, $22.

Lubke's History of Art

"Not only to American students, therefore, but to all English-speaking readers this edition is the best accessible."—*Boston Journal.*

Lubke's History of Art.

"It is remarkably free from errors, and marked by sound judgment upon the relative merits of art-schools and artists. It has the great merit of freedom from bias and sentimentalism, and forms a welcome contrast to the uncritical and half-digested books upon art which are daily issued from English and American presses."—*Literary World.*

Lubke's History of Art.

"Mr. Cook's notes will prove very valuable to American students, especially through their continual reference to American collections and to English books not mentioned by the author. . . . There is no other book in American or even in English literature, so far as we know, which might take its place."—*Scribner's Monthly.*

Are Manufacturing and have on Exhibition a Choice Selection of Desirable Articles especially appropriate for the season.

CENTENNIAL MEDALS AND DIPLOMAS awarded to this Company for "SUPERIOR" SILVER-PLATED WARE.

EXTRACT FROM CENTENNIAL JUDGES' REPORT.

"Their large variety of Silver-Plated White Metal Hollow-Ware is of excellent quality and finish, and of tasteful designs."
"Their Silver-Plated Forks, Spoons, and Knives are of superior quality and excellent finish. Their XII Plating, or extra plating on exposed parts, deserves commendation."

EXTRACT FROM AMERICAN INSTITUTE REPORT.

"The Porcelain-Lined, Double-Walled Ice-Pitchers are A1, and possess all the qualities the company claim."
"We consider the goods made by this company to be by far the best made in this country, and, we believe, in the world."

First Premiums awarded at all fairs were exhibited, from World's Fair, 1853, to American Institute Fairs, 1873, 1874, and 1875, inclusive, and at Philadelphia Centennial Exhibition, 1876.

PATENT PREPARED

Gasolene.

The attention of owners of Gas Machines is invited to the superior quality of Gasolene that we are making.
Manufactured by a process that is patented by ourselves, it is peculiarly free from all the impurities and heavy properties commonly found in other Gasolenes.
We manufacture these goods more largely than any other house in the world, and are prepared to furnish any gravity from 80° to 90° Beaume, by the single barrel or car-load.
Orders solicited from gentlemen owning private country residences.
Hotels, Mills, and Manufactories supplied on the most favorable terms.

The Nation.

NEW YORK, THURSDAY, MARCH 21, 1878.

The Week.

MR. BLAINE, in his attack on Mr. Schurz, apropos of the Montana lumber troubles, made a point of Mr. Schurz's having been born in Prussia, which is, he said, a much smaller country than Montana; the inference being that to deal properly with the lumber question the Secretary of the Interior should, if of foreign birth, have been born in a state at least as large as that in which the alleged depredations on Government property have been committed. There is one other little peculiarity of Prussia which the Senator did not mention, but which has far more bearing on this case than the smallness of its superficial area. If the President of the Lower House of the Landtag were convicted on his own admission of having officially ruled in favor of speculators, and called their attention to it that they might pay him for it, and had denied all connection with a speculative scheme which was seeking legislation in the House over which he presided, and in which it afterwards turned out that he was largely involved, far from being promoted to the Upper House, he would not only be expelled from the army, or the civil service, or the legislature, but he would have to withdraw totally from public life. More than this, he would be expelled from the parlors and dining-rooms of honorable men, and would be grateful for the undisturbed obscurity of a private station in a country village. Moreover, if the German Government, knowing what we in this country know of Mr. Blaine's career, heard he was about to be born on German soil, it would take means to impose the event on the territory of some weaker power, and he would probably come into the world a Belgian, or Dane, or Dutchman. Let us add, finally, that while no man can determine the place of his birth, it is every man's duty to see that his life reflects credit on it; and this duty, it seems to us, Mr. Schurz has discharged, while Mr. Blaine has grossly neglected it.

The Maine Senator had hardly finished his lumber speech when he was assailed by Dr. Woolsey, of New Haven, who showed in a short letter to the *Tribune*, by the citation of several authorities, that international arbitrators sit under the doctrines of the Roman law, and that the rule is well settled that, in the absence of any stipulation to the contrary, a majority shall decide. It appears, too, that the choice of M. Delfosse was concurred in by our Government with strong official expressions of gratification and esteem, so that Mr. Blaine's attack on him was apparently made without obtaining proper information as to the facts; or, in other words, was both ignorant and wanton. Indeed, the last week seems to have been the worst in the Senator's recent blundering career. His course since he left the Speaker's chair has been that of a smart but ill-bred boy, with a smattering of some kinds of knowledge and a determination to attract notice somehow. To no serious subject of legislation does either he or the class of Senators to which he belongs seem to give any care or attention. All their powers, such as they are, seem now absorbed in getting up little "hits" and "digs" at the Administration, and they hold their sides as they laugh over each other's little jokes, like that wonderful one of Mr. Blaine's in which he showed that certain Montana petitioners evidently thought, from the form of their address, the Secretary of the Interior a greater power than the House or Senate.

Mr. Evarts has sent a circular to American representatives abroad directing them to call the attention of the governments to which they are accredited to the passage of the Silver Act, and to invite them to the Conference which that Act proposes "for the purpose of adopting a common ratio between gold and silver," so as "to establish internationally the use of bi-metallic money and secure fixity of relative value between those metals"; the Conference to take place whenever any three of the governments thus invited agree to the same. He informs our ministers likewise that the President, having expressed in his annual message to Congress "his opinion in favor of maintaining silver as one of the two precious metals which furnish the coinage of the world, and keeping up to as full a measure as possible the volume of the two precious metals as our intrinsic money," and the Silver Act "having passed by very great majorities of both Houses," "the policy of this country in support of bi-metallic money may be considered as decided." He says also that "the position of this country commercially" gives it a paramount interest in the proper adjustment of the two precious metals as "the intrinsic and universal money of foreign trade." We do not well know what Mr. Evarts means by "intrinsic money," but we must point out to him and to the ministers who have to present this scheme to foreign governments that his account of the policy of this country, as expressed by the Silver Act, is not strictly accurate. The bill does not provide for the circulation of the two metals side by side in this country or anything like it. That can only be done by so fixing, and from time to time refixing, the relative value of gold and silver coins, that one shall be as attractive as the other as legal tender; or, in other words, that it shall not be more profitable to export the one than the other. The Silver Bill does nothing of the kind. It makes or leaves gold from eight to ten per cent. more valuable than silver, and makes silver a legal tender for all amounts, so that when silver gets fully into circulation gold must disappear, under Gresham's Law, and silver become our only "intrinsic money," unless there is a considerable rise in its market value. This is not a matter of speculation, it is a matter of fact; and we trust Mr. Welsh, Mr. Taylor, and General Noyes, at least, will not act on Mr. Evarts's instructions without mastering the subject for themselves and being prepared for the answer which they will probably receive from English, German, and French financiers.

The thing for them to say—if we may venture to make the suggestion—is that the recent legislation, by its restrictions on the coining power of the Treasury, will practically leave the question which metal is to serve as the currency of the United States, open for two years or thereabouts; that after that, unless other governments join us in the adoption of a double standard, we shall be thrown back on a single standard of silver, and that it is for their advantage as well as ours to join us while we still have any gold, or the means of getting any, in taking measures to insure the joint circulation of the two metals in so far as careful international rating can do it. We do not say that an appeal of this kind will be successful, but we do say that it is the only statement we can make which will convince foreign financiers that we understand the problem.

The importations of United States bonds from Europe continue on a large scale. These, together with the importation of £400,000 silver bullion, advanced the rates for bills on London from 4.85 to 4.87 for sixty-day and from 4.87 to 4.89 for demand drafts. The specie-shipping point is about 4.89½, so that it may be said that the Silver Bill has reversed the exchanges within twenty days, the extent of the reversal being from the point at which gold could be imported to nearly that at which it could be exported. The £400,000 bills bought to pay for silver were on account of a Treasury operation; the Secretary found silver to be cheaper in London than in any part of this country, since the financial magnates of the Pacific coast would have it so. The gold market is still weighed down with an enormous stock—about $40,000,000—and with no demand for it except for customs, which takes from $2,000,000 to $2,500,000 per week. At the Stock Exchange there was a strong market for speculative shares, in consequence of the prevailing opinion that Congress

is bent on some kind of inflation. The gold value of the "paper dollar" at the close of the week was $0.9876. The bullion value of the new silver dollar was 91¼ and 92 cents gold. These dollars appeared in small amounts during the week and ruled at about par in gold—which, of course, they will continue to do until there is an adequate supply of them; then they will begin to sink to their bullion value.

The real silver-men have already begun to perceive the inherent treachery and fraud of the present Silver Act and the mockery of cheap money which it offers. The House Committee on Banking has accordingly reported in favor of legislation compelling the Treasury to issue certificates at par against the deposit of silver bullion, like the gold certificates now issued. This would get rid at one blow of the restrictions on the injection of silver into the circulation created by the limitations which the Act now in operation places on the coining powers of the Treasury, and also of any limitation imposed by the temporary scarcity of mints. It is true that the Committee do not propose to make the certificates a legal tender for anything but Government dues, but they would nevertheless constitute a working addition to the circulation, and would furnish a market to the silver dealers in which they would be able to share in the profit now made by the Government on the coinage. It looks more and more, in fact, as if "the money power" had got the better of "the people" in this last bit of legislation also. We would suggest, as a means of making the issue of certificates a final and complete measure of relief, that the Government should be compelled to issue them, bullion or no bullion, to the amount say of $10 a head of population, or $400,000,000 in all, and divided on that basis among members of Congress for distribution in their respective States and Territories, to all adult citizens not lunatics or convicts. In no other way that we know of can the poor man get his share of the national money, or the money be applied on the very axle of "the wheels of industry."

The Senate listened on Wednesday week to Mr. Blaine's tirade against Prussia, and passed the Military Academy Bill; on Monday it passed the Fortifications Bill, and confirmed without debate Mr. A. W. Beard as Simmons's successor in the Boston Custom-house; on Tuesday it granted the Woodruff speculation an American register. On the same day Mr. Blaine received still further enlightenment as to the law and the usage in regard to Government timber. Mr. Hoar showed him that it was not in charge of the Secretary of the Navy, and Mr. Ingalls that the Land Office had charged stumpage to settlers in 1864. On Wednesday week the House passed the Consular Appropriations Bill, and the Bennett American Register Bill; on Thursday, by 118 to 116, the bill to extend the time for the payment of the tax on whiskey in bond; and on Saturday it struck out the enacting clause of the bill in the interest of the ante-bellum mail-contractors at the South. The bill has since been reintroduced in a new form.

The Committee of Ways and Means finished the revision of Mr. Wood's Tariff Bill last week, and, it is said, are now applying the last touches, intending to report the amended bill to the House before the end of this week. The amendments agreed upon have been from time to time reported by the daily papers, but in so fragmentary and loose a manner that we deem it quite unsafe to venture upon a review in detail before the final text of the bill has been published. In the meantime there seems to be good ground for assuming that the original bill has been purged of its grossest imperfections and inconsistencies; many of the important articles now free, which the original bill proposed to render dutiable, appear to have been dropped and thereby restored to the free list, and the numerous changes that have been made in the rates of duties in most cases appear to have been adopted after fairly weighing the information given and the objections made to the Committee. We venture to say that the bill in its new shape will prove much more acceptable than the original draft, and will generally be considered a decided improvement on the present tariff. We do not believe that a detailed discussion in the House can improve it, and our Representatives will confer a boon on the mercantile community by promptly passing the bill and so making a speedy end to the existing uncertainty.

The final returns from the New Hampshire election last week show that Governor Prescott, the successful candidate of the Republicans, received about 1,000 majority against nearly 4,000 the year before, when, however, the total vote was larger by some 16,000. The result seems to have encouraged both wings of the Republican party in the State and out of it. On the one hand it is pointed out that Governor Prescott "believes in President Hayes," that he was nominated by a convention which endorsed Hayes's "policy," and threw cold water not unmixed with contempt on W. E. Chandler, and that the most active managers of the canvass were also conspicuous supporters of the Administration. On the other hand it is asserted that "the State has been saved by the Stalwart Republicans, and to them alone the credit for the victory is due"; that "in every town where there has been a strong Hayes element there have been large Republican losses"; and that the author of the famous definition of Chandler as "a political tramp" was defeated in caucus, and more miserably still at the polls, in Exeter, where he stood (rather than ran) as an independent candidate for representative to the Legislature. Chandler himself appears to have voted the regular ticket, and alone knows whence he expects his reward for his *brutum fulmen* against a renegade President. This is the last of the spring elections in New Hampshire, which yields at length to the prevailing November usage.

The discharge of Anderson by the Louisiana Supreme Court must make a good many Northern publicists feel rather foolish, and must make the President feel very glad that he did not write that remarkable letter to the Attorney-General which they thought he ought to write, or that he did not publish it if it was written. The Court has quashed the conviction on the ground that the "consolidated returns" in which Anderson was alleged to have committed the forgery are not a "public record" within the meaning of the statute, and that the Returning Board might have played tricks with them without affecting the general result. The "packing of the jury," on which our "stalwart" press relied so much, the Court says did not take place, and the trial, on information filed by the District Attorney, which came near causing several editors to take up arms on account of its monstrosity, it pronounces a regular and usual proceeding. But it did not consider the letter written by two of the "visiting statesmen" during the trial, and which seems to have got into the record, a regular or usual or respectable document, and expressed some proper contempt for it. We hope, however, the President did not say, as reported, on hearing of the decision, that the conduct of the Court had been "patriotic." If patriotism, or any other noble passion except a desire to administer the law as it stands, had anything to do with the decision, the Court is afflicted with the complaint which has made the Returning Board so notorious and offensive. We hope the President will now at least remove these two men—Anderson and Wells—from office. They are closely connected in the public mind with scandalous abuses; their character in the community in which they live is, apart from politics altogether, very bad, and their retention as Federal employees is a standing source of irritation.

There is another new charter for this city before the Legislature, this one being known as "the Daly Charter." It contains many admirable provisions—as the new ones always do—and is the thirty-ninth which has been submitted to the Legislature within the last thirty years. The calm and even hopeful enjoyment with which each one, as it has come forward, is discussed by the daily press is a pleasing spectacle in this busy and utilitarian age. What is most curious about this is that it would appear that what "the people" like in the way of city government is the discussion and

adoption by the Legislature of a charter and a third each year, while even the submission to their vote of a plan which provides a permanent charter would fill them with rage, and ruin everybody connected with it. Not only would they vote down such a thing, but they would never forgive anybody who asked them to look at it. As an illustration of the way the city is now governed, and one which Christian people everywhere will understand without any special knowledge of our municipal affairs, let us say that the city prison, the Tombs, is one of the most important of the municipal institutions, and makes as large demands as any of them on whatever civilization and humanity New York possesses. Its Warden ought to be one of our best citizens as regards skill and experience in the particular field of prison management, and as regards standing and character in the community. Well, the last Warden, who has just died, was simply an active, able-bodied ward politician, reaching his position through the usual experiences of the fire-company and the liquor-store caucus, and was famed mainly for his intimate acquaintance in a social way with the criminal population of the Sixth Ward. The person who is now most likely, it is said, to succeed him is Mr. Reese, a brass-finisher by trade, and an old volunteer fireman, who has been ever since the war a clerk in the Finance Department, then a deputy-sheriff under Brennan, and always an active Democratic politician, "with much influence in the Sixth Ward."

Governor Robinson, in his veto of the chapters of the new Code just passed by the Legislature, brings forward several strong reasons why the whole scheme should be given up and the old Code re-enacted as it stood before. It seems, in the first place, that the Commissioners, instead of confining themselves to the work they were originally authorized to undertake, that of revising and consolidating the statutes, have set about an entire "upheaval" of an established system of legal procedure. In the second place, although "hundreds of amendments" to the Code as introduced by the Commissioners have already been found necessary to save the bill from "utter condemnation," the petitions in its favor admit the necessity of still further amendments. Many provisions show great haste or ignorance, and threaten the public with serious dangers if adopted. For instance, under the sections relating to arrest, it would appear that anybody is liable to arrest who has committed "an actionable act whereby the estate of another is lessened." The bill gives general equity powers to surrogates, a class of judges, as the governor points out, not usually chosen with great care nor possessing high qualifications. The chapter on summary proceedings to recover possession of lands (in use every day by landlords) "substantially destroys" that process altogether. The clauses embodying the "Civil Damages Act," which gives a remedy for injuries caused by the sale of intoxicating liquors, enlarge the scope of the law so as to give an action for the breach of a *contract* caused by the sale of liquor—a principle never heard of before, and impossible to apply in practice. By the sections relating to practice in surrogates' courts an allowance of five per cent. may in any contested case be made by the surrogate, at his discretion; *e. g.*, Mr. Calvin may in the Vanderbilt will case divide $3,000,000 at his pleasure among the parties to the suit. From the foregoing it will be seen that the bill, while professing to be a mere revision of existing statutes, changes the body of the law itself, to what extent no one knows; and finally, not content with all this, the Commissioners have in a multitude of cases changed the existing language of the statutes, settled by repeated judicial construction, where no change in the purport of the law is intended. To cap the climax, the bill was passed by the Legislature without being read.

The Rev. John Jasper, of the Zion Colored Baptist Church, in Richmond, Va., the largest colored church in the city, proved on Sunday last out of the Bible that the sun moved and the earth stood still. One of his strongest corroborative arguments was that if the earth turned round, as the astronomers said it did, "the ocean would be spilled over the land." He warned his people solemnly against the philosophers, and that he carried conviction was shown by the fact that when at the close he called on those who believed that the sun moved round the earth to hold up their right hands, every hand in the church was raised. It is impossible not to regard this, in the light of recent events, as part of the great movement now spreading over the country to give the poor and ignorant a fair chance in the solution of the leading problems of the day. A good many branches of knowledge have been kept until now in the hands of persons who have had leisure enough and money enough to study them, until the arrogance of this class has become intolerable. The people are, however, going to take the astronomy question into their own hands, as they have taken the money question, and the word of the honest, God-fearing laborer, no matter of what color, will soon go as far about the motions of the planets as that of the bloated astronomer in his luxurious observatory with his costly instruments, which never would have existed but for the toil of the industrious mechanic. A good deal of public money goes now to the maintenance of him and his paraphernalia which could be far better spent in beautifying or cheering humble homes.

Fortune seems to be steadily favoring the new régime in France. The bill regulating the state of siege has passed the Senate with but trifling modification by a majority of 153 to 100. No executive officer can now proclaim martial law in any part of France except in case of invasion and in the actual presence of the enemy, and he must promptly seek the sanction of the legislature even for this. One of the greatest terrors of the late crisis is thus removed. This happy adhesion of the majority of the Senate to the Ministry has been brought about by the secession of twenty Senators from the group of thirty-three known as Constitutionalists, and who during the late crisis acted with the Legitimists and Bonapartists up to the moment when Marshal McMahon began to talk of another dissolution. It was their positive refusal to sanction anything of the kind which, it is now known, finally prepared the Marshal for surrender. Since the downfall of the Broglie-Fourtou Ministry they have been becoming more and more doubtful about the propriety of continuing in the old alliance, and these doubts have been strengthened by their increasing satisfaction with the Dufaure Ministry; so a fortnight ago twenty of them abandoned the Legitimist and Bonapartist Right, and declared that they would vote hereafter "according to the inspiration of their conscience and their patriotism." This gives the Ministry a good working majority in both Houses. Another piece of good luck for M. Dufaure is to be found in the fact that at fifteen new elections, ordered in districts where the Conservative candidates have been unseated for bribery and intimidation, the Republicans have carried all but four seats.

The news from Turkey has as yet nothing decisive in it. But Russia is evidently not going to leave anything to luck, and has been pushing troops round Constantinople to the Bosphorus, which she may now be said to hold firmly, having reached at least the neighborhood of Buyukdere with a considerable force, where she has a torpedo flotilla, on which, however, she denies there are any torpedoes, but there can hardly be much doubt that there is a supply of them not very far off. As the Turkish water-batteries are open on the land side she can, of course, occupy them whenever she pleases, and indeed may be said to have secured the Black Sea against the entrance of the British fleet, which, on the other hand, has been heavily reinforced. Negotiations are still going on as to what Russia will submit to the Congress. The reports about these are very confused, but the fact seems to be that Russia offers to read the treaty to the Congress, and then to debate which articles are of European interest and which not, and with this Austria and Germany are disposed to be content. England, on the other hand, insists that Russia shall bind herself before going into the Congress to submit the entire treaty to the Powers for their sanction and revision; and the talk even of the London *Times* on this point is warlike. It is more than likely that if England fights for this she will fight without allies.

SENATOR MATTHEWS'S PACIFIC-RAILROAD BILL.

WE have already pointed out the principal objection to the bill reported by Senator Matthews from the Senate Committee on Railroads to create a sinking fund for the liquidation of the Government bonds advanced to the Union and Central Pacific Railroad Companies—namely, that it proposes to enact a law now to meet a contingency occurring a long time hence, and that it extends for a further period of twenty-five years a subsidy which does not come due till about the year 1900. In other words, the bill projects itself over a period of forty-five years, and in such a manner that, once passed, Congress cannot again resume control of the matter except in the event that the railroad companies fail to comply with its terms. This is a violent and wide departure from the spirit of previous Pacific-Railroad legislation, every step of which has been guarded by reservations of absolute control on the part of Congress, the wisdom of which cannot be gainsaid. Whether without these reservations Congress would have such control may be a debatable question. That such control is now held was conclusively shown by Senator Davis, of Illinois, in his brief and lucid speech on the 12th inst. The drift of Senator Matthews's bill, and still more that of his speech, implies that it is a desirable thing that the Government should cease to be the master of these corporations and should descend to an equality with them in all future relations, provided they continue to give the Government a preference in the way of transportation, and to charge no higher rates to the Government than to private parties, and to make the contributions to the sinking fund stipulated in the bill. Upon these slender considerations the bill proposes that the United States shall abdicate its present attitude towards these companies, which is none other than that of a sovereign, and become merely the John Doe or Richard Roe of future lawsuits.

But this is not all. The bill provides that the payments mentioned shall be in lieu of all payments now required from these companies on account of the subsidy bonds. That is, it makes a very considerable change in the relations which have existed between the Government and the companies since the year 1862. The payments now required to be made (not for sinking-fund purposes but for actual reimbursement) are five per cent. of the net earnings and one half of the Government transportation account, amounting at the present time to $666,000 per annum for the Union Pacific and $500,000 per annum for the Central Pacific. This sum of $1,166,000 per annum the bill proposes to release to the companies by turning it into a sinking fund, and allowing them six per cent. interest upon it compounded semi-annually. The inexpediency of radically changing the terms and mode of payment after they have been in operation more than fifteen years—that is, more than half the lifetime of the subsidy—ought to be apparent to any lawyer. No change should be made except upon the gravest consideration; yet the only one which appears upon the face of the bill is that the companies are thereby released from very considerable payments which they are required to make under existing laws, *pari passu* with the disbursements from the Treasury of interest on the subsidy bonds.

The public are not disposed to deal harshly with these companies. Notwithstanding some very considerable provocations, among which may be recalled the Crédit-Mobilier transactions, the refusal of the companies to pay the 5 per cent. quota of their net earnings, and the evil spectacle they present with their crowd of lobbyists every year in Washington, there seems to be no disposition anywhere to take vengeance upon them or to subject them to any injustice. But we question whether public opinion will sanction any measure which extends the present subsidy beyond its maturity. It is difficult to see upon what ground opposition to railroad subsidies in general could be based if a subsidy to two wealthy corporations having twenty years to run were now extended twenty-five years longer, or even one year. After the existing subsidy comes due, any extension of it is a new subsidy, the same as the subsidy now asked by the Texas Pacific Company. The voice of the country is distinctly against this subsidy; but what better claim has the opposing corporation, the Central Pacific Railway Company of California, to a subsidy commencing in the year 1900 and running to 1925? Many bills to accomplish this end have been before Congress at various times, but none has been so objectionable in this regard as that of Senator Matthews. The Gordon Bill in the last Congress, which the railroad lobbyists used every exertion to pass, granted an extension of only ten or twelve years, and it was understood they were willing to compromise on seven. Under the Gordon Bill, it is true, they received the benefit of compound interest during the extended time, while under the Matthews Bill they receive it only till the year 1900. Under the Matthews Bill, however, they are to receive compound interest till the year 1900 on payments which they are required to make now, by virtue of the Act of 1862; and for this concession we can see no defence whatever.

The rational method of dealing with this subject is to leave existing laws as they are, and to require the companies to set apart a portion of their earnings each year to ensure the ultimate payment of the subsidy. This the companies will consent to do, unless they intend to cheat; and if they intend to cheat they should be dealt with as other cheats are dealt with. To leave existing laws as they are is to leave the 5 per cent. clause, the Government transportation clause, and the clause relating to the maturity of the subsidy undisturbed. What it may be wise to do when the subsidy matures the present generation cannot know, and it is only a very presumptuous person who will undertake to legislate for so remote an eventuality. We may fairly suppose that our children will be able to extend these subsidies when the time comes, if extension is desirable. All we can properly do is to take such measures that the mortgaged property shall continue to be worth the debt, that the earnings shall not be wasted, that the roads shall not go to ruin, and that the security shall not be impaired. These principles are embodied in the bill of the Senate Judiciary Committee with great care, and, we may add, with great moderation. The Matthews bill, reported by the Railroad Committee, is a subsequent conception apparently hostile to the Judiciary Committee's bill, and evidently satisfactory to the two railroad corporations concerned, because it is not to take effect at all without their written consent. Consequently, the public may look for an animated and perhaps angry controversy in the Senate, for it is seldom that so much money as these bills involve comes into dispute without leading to exhibitions of bad temper. Under the circumstances we can only consider the Matthews bill as the railroad companies' bill, not meaning that it is exactly the kind of bill they would draw if the matter were left wholly to them, but that as between the two bills pending this is the one they will exert themselves to pass. A strong presumption exists therefore that it is not favorable to the Government, and this presumption is fully warranted by an examination of the text.

THE POSITION OF AUSTRIA IN THE EASTERN CRISIS.

THE European news appears to indicate that Austria is placed, if possible, in a position of greater difficulty by the Turco-Russian Treaty than England herself, and that this difficulty has been considerably aggravated by Prince Bismarck's late speech. The Treaty is objectionable to Austria on various grounds. She dislikes the retrocession of the piece of Bessarabia to Russia, as giving her, in combination with the creation of the Bulgarian Principality, the control of the Lower Danube. Then, the new Principality bids fair to be a close dependence of Russia. It is already in the hands of a Russian administrator, and is being organized on the Russian plan. The newly-appointed officials are Bulgarians who have been educated in Russia. The new native army or militia is to be officered largely, if not wholly, by Russians, and the Russian troops are to remain in occupation for six months at least. The enlargement of Servia, too, is not welcome, as strengthening another Slavic principality which will be largely under Russian influence. Finally, the proposal to give Montenegro the port of Antivari is looked on as simply another way of providing Russia with a naval station on the Adriatic.

In considering the best mode of dealing with these difficulties,

Count Andrássy finds himself met by the fact that the Slavs of the Empire are quite ready to have him plunge into the fray and take everything Slavic that Russia is willing to let him have. The Magyars, on the other hand, would fain have him join England in depriving Russia of her conquests, while the Germans would like him to imitate the waiting policy of the German Empire. It was natural that under these circumstances Prince Bismarck's speech should have been looked for with considerable anxiety at Vienna. That it should have been expected to contain some words of comfort for Austria was inevitable, in view of the Chancellor's explicit declaration at the close of 1875 that Austria's interests were those of Germany, and that "if war should arise out of the Turkish complications German neutrality would cease if Austria were to be involved or vitally wounded in the struggle," in which case "Germany would intervene to preserve the existence of the Hapsburg Empire in its present shape and extent"; for "the unimpaired existence of the Austrian Empire was indispensable for the security of Germany." He wound up by saying that "were the Eastern question to kindle a war between Austria and Russia, whatever the issue of the campaign, Austria might count on their [our] arms for the preservation of her integrity." Count Andrássy, on the 19th of February, communicated formally to the Austrian and Hungarian parliaments the belief of the Ministry that Austrian interests *were* vitally menaced by the Turco-Russian Treaty, which would be treated by Austria as null and void unless approved by the Powers in Congress. On the same day, however, Prince Bismarck made his speech to the German Parliament, of which we have already given a summary, in which he said, with the utmost frankness, that the Treaty was not, and was not likely in any way to become, a German affair, and that at all events if there was to be a fight over it Germany would keep out of it. Curiously enough, this was accompanied or followed by numerous courteous articles in the semi-official or "inspired" press, advising Austria to enter on her great mission of civilizing the semi-barbarous peoples of Eastern Europe.

Bismarck's oratory is so novel, and at the same time so pregnant, that the analysis and interpretation of it have become a sort of specialty among Continental politicians, and may almost be said to have produced a school of commentators. Its ruggedness and directness, and almost savage indifference to the old *convenances*, have given his speeches somewhat the air of a pugilist's practice with the clubs; so that most people crowd to listen to him more for the sake of seeing the play of the great muscles under the silken skin than in the expectation of learning anything. The one thing he makes plain is that he is looking after German interests, and that Germany neither fears nor has any reason to fear anybody. But a good many critics are of opinion that by observing him closely, year by year, a fair estimate of his foreign policy may be got at, and the deduction that these experts now draw from the apparent contradiction between his language in 1875 and his recent declarations is that he does not look for any trouble between Austria and Russia—that is, he knows that one or the other, and probably Russia, will yield whatever Austria requires, and that therefore there is no need to declare himself on either side, or mar that cordial understanding which he says still exists between the three Emperors; and his reticence counts for more than Andrássy's outspokenness. His phrase, "beati possidentes," applied to Russia, excited a good deal of alarm in England, as it looked as if he had been reading the Bible in the Vulgate in his retirement at Varzin, many people supposing the phrase to have been extracted from some obscure portion of the Hebrew Scriptures, and used cynically to express his heartfelt sympathy with the strong man who has got what he wants and means to keep it. It turns out, however, to be merely a phrase from Heineccius, the German law-student's Blackstone, and is but a terse rendering of our phrase that "possession is nine points of the law."

There is, in fact, no reason as yet to abandon the theory which we reproduced in these columns at an early period in the war, that he expects to use the present crisis in making Austria a more distinctly Slavic power than she is now. Russian demands at the Conference will probably be supported sufficiently to reconcile Austria to the idea of seeking compensation, say, in Bosnia and Herzegovina, the Turkish retention of which, when cut off by the intervening territory of Bulgaria, will hereafter seem quite shadowy, and which must in the natural order of things fall into Austrian hands. Already there are ominous stories of meetings of the Bosnian beys, or great Mussulman land-holders, for the purpose of seeking annexation to Austria. It is added, by way of making the scheme seem more feasible, that as these gentlemen are all of Slavic blood, and only became Mussulmans at the time of the Turkish conquest to save their estates, and have never been very fanatical in their devotion to the Prophet, though full of hatred for the rayahs, they would have no great difficulty now in going back to the faith of their ancestors. This plan is rendered all the more attractive by the fact, which is generally perceived, that Austria's constitution is not equal to the strain of such a situation as that through which she is now passing, and its weakness must show itself still more markedly in war than in peace. The Austrian army, even when it has had a united government at its back, has been since the beginning of the century the most unfortunate, considering its bravery and discipline, in Europe. A very competent critic, Major Adams, an Englishman, who served for many years under the Austrian flag, and was afterwards Professor of Military History at the Staff College in England, explains in his recently-published, valuable work, 'Great Campaigns in Europe,' the causes of its weakness, and they are causes which in a conflict with Russia must tell more seriously than ever before. They are, he says, the heterogeneous character of the material which fills the ranks; the absence of national spirit; the want of individual independence, and the difficulties of language which separate the soldier from his officers. The admirable qualities shown by the Austrian army in defeat he attributes to the "high spirit, devotion, and *esprit de corps* of the regimental officers." The troops, he says, vary greatly in quality, however, the best being those recruited in the German provinces. All these defects would probably come out more strongly in a contest with Russia than with any other power. The only portion of the population which would enter into it heartily would be the Magyars and Poles, who are but a handful. The Bohemians, Croats, and other Slavs would display either their old indifference or positive hostility to the struggle, which, in case of victory, must, too, in any case, result in annexation on the side of Turkey, or else the assumption by Austria of the task Russia now has on her hands, and which, it must be remembered, would be equivalent to annexation; for Turkey cannot be restored. Though last not least, the peace has given Russia ports on the Black Sea, or, in other words, a secure maritime base, which takes away from Austria the power, which during the war made her so formidable, of acting directly on the Russian communications.

TWO LONDON PLAYS.

LONDON, March 2, 1878.

IT is not often that an Englishman can honestly praise a dramatic performance given by English actors and actresses. The genius of the country is unfavorable to the stage. The countrymen of Shakspere and of Sheridan can no longer compose, and the countrymen and countrywomen of Garrick and of Mrs. Siddons can no longer act. We have no first-rate performer in any of the departments of the mimetic art in Britain. The delineation of tragedy died with Macready. Comedy, now that Alfred Wigan has retired, has no worthy representative. In opera we have never succeeded, never even reached the second order of art. Farce and burlesque have many votaries and some successes; but the successes have owed their reputation rather to their physical than their intellectual qualities. And, after all, it is a poor country, dramatically speaking, that trusts to farce and burlesque for its greatest modern dramatic achievements. Yet it is so with us. France, Italy, Germany, Sweden, have all in recent years produced great performers in some department of this art. England has produced none. In the other arts—in painting, in poetry, in music, in fiction—we have fairly held our own. But we have not done this in acting. And while we have fallen away in this department we have not made up for it by our compositions for the

stage. As the power of performing seems to have deserted us, so the power of writing anything worthy of being performed has gone also. Whether the indifferent acting is the cause of the indifferent writing, or the indifferent writing of the acting, is a nice question. The mystery of cause and effect is not in this case easy to unravel. The fact remains that we have very little original talent in the way of acting, and none in the way of writing. We go to France for our plays, and the most original actor we have had for a long time is Mr. Jefferson, an American. Some people explain away our shortcomings in this respect by throwing the obloquy on the theatrical managers. They take no pains. All they want is something that will suit the taste—not a sensitive or highly-trained taste—of the English public, and fill the houses, and have a run of many nights. There is one piece at the present time that has had an uninterrupted run of more than one thousand nights, or some three years and a half. It is a silly, vulgar piece, with little humor, and it is indifferently acted. But it has hit the mark, and solid tradesmen and their giggling daughters go night after night to see the representation of one of their own class aping the airs and ways of a man of a different social class, and night after night they appear to enjoy the wretched man's discomfiture. In this case the manager has achieved a success. But this is an accident. As a rule these potentates do not go about their business in a business-like way. They do not engage a playwright to produce a play some twelve months hence, which shall be carefully and frequently rehearsed and appropriately put upon the stage. They suddenly find their audiences diminishing, and it dawns upon them that they want something new. They order a play to be ready in six weeks, very much as they would order a suit of clothes. The unfortunate playwright casts about for an inspiration, and rushes off to Paris, where he sees something that may be toned down to suit British prejudices. He makes his arrangements, adapts the piece, and brings it to his manager. The latter throws it on the stage without adequate preparation, in a half-cooked fashion. He trusts to his luck and to the friendly criticism of not impartial newspapers, and hurries the thing through without forethought or preparation, and it is either a hit or a miss, as circumstances turn up.

But amid all this theatrical chaos one of our theatres—the Prince of Wales's—stands out as a sample of successful management. It is conducted on radically different principles. In this house everything, down to the smallest detail, is attended to with intelligence and carried out with taste and enterprise. If anything might be said against the management, it is that attention to detail is sometimes overdone, and little knick-knackeries of furniture and upholstery are introduced in excess into the scenery and stage decorations. This, however, is a fault on the right side. This house is owned, I believe, as well as managed, by Mrs. Bancroft, who, as Miss Marie Wilton, has been long a favorite, and deservedly so, of the theatre-going public. No one can call Mrs. Bancroft a great comedian; but, for an Englishwoman of our degenerate—theatrically degenerate—days, she has talent, and, if she manages the theatre by her own unaided exertions, she has high administrative faculties. For some time this house has been esteemed the best in London. It earned its reputation by its successful performances of modern English comedy as exhibited by the late Mr. Robertson, whose plays, "Caste," "School," "Ours," and "Play," commonplace though they are when put alongside of the higher efforts of the last century, hold a fair place among the dramatic results of late years. The company of the Prince of Wales's has absorbed whatever talent there is on the London boards, and the management has secured what does not exist in any other house in England—namely, that every part, even the most subordinate, shall be well rendered. And it is here and in the careful arrangement and furnishing of the stage that this house excels. A dialogue between a housemaid and a boy in buttons is as well given as an emotional scene between the hero and heroine, and the arrangement of the Chippendale chairs and the old china of a modern English room is as minutely cared for as the marshalling of a great tableau at the Grand Opera in Paris. Mrs. Bancroft herself not unfrequently takes the humblest parts, and her husband, who ranks high among such comedians as we have, made a successful hit in a recent play given in this house by his rendering of the subordinate character of an English butler on the Continent—a small part for a man of his position in the theatrical world, but well worth doing, even as an example of the way in which the management is conducted.

Of late years English adaptations of successful French pieces have been the staple performances in this house. The company made one attempt at the "legitimate drama." They tried the "Merchant of Venice," but it was a conspicuous failure. The audiences who delight in Robertson and in Anglicized editions of Sardou, are too critical to appreciate Shakspere reduced to the Robertsonian level and looked at through Robertsonian spectacles. The "Merchant of Venice" died almost still-born, and the management with great good sense appreciated the situation and replaced the "legitimate drama" by something more congenial to and more within the compass of the company. At present they are giving Sardou's "Dora" in an English dress and under an English title, "Diplomacy." It has been in preparation for many months; it is elaborately put upon the stage, finished to the minutest detail, even to the mechanical fittings of the French shutters in the morning-room at Monte Carlo, and it promises to have an unprecedented run. It has hit the prevailing sentiment of the hour—distrust and suspicion of Russia—and night after night the most fashionable people in town go to watch, with the intensest interest, the entanglement of the English attaché's wife in the meshes of a web of political intrigue woven by a Russian agent in the pay of the Russian Government, and the extravagant dénouement of the plot by means of a pair of scented kid gloves. Stalls and boxes are engaged for weeks ahead; indeed, now on the 2d of March, it is almost impossible to get seats till well on in the spring. The Eastern question may be solved and the Russian troops back at St. Petersburg before the London public will be tired of seeing the discomfiture of the wiles of Russian diplomacy as given at the Prince of Wales's.

This unusual success has afforded an opportunity to one of our farce-writers, Mr. Burnand, the author of "Happy Thoughts," to bring out a parody of "Diplomacy" as played at the Prince of Wales's, and at the obscure little theatre called "The Strand" he has brought out a musical skit on "Diplomacy," which he calls "Dora and Diplomacy; or, a Woman of Uncommon Scents." The story goes that Mr. Burnand "assisted" at a performance of "Diplomacy" and went home and wrote his parody straight off at a single sitting, occupying him all night. I cannot vouch for the truth of this story, but judging by the texture of the parody I can easily believe it. Yet it is amazingly clever, full of points, and puns and plays on words, and is acted by three or four of the parodists with spirit and success. It promises to have as good a run as the original. But, clever though it undoubtedly is, and amusing in its way, it leaves a melancholy feeling on the mind that, if this is the best sort of thing the London theatres can produce, Mr. Matthew Arnold is not far off the truth when, speaking of one considerable section of the middle and lower classes in England, he says, in the *Fortnightly Review* of this month: "We may partly judge its standard of life, and the needs of its nature, by the modern English theatre, perhaps the most contemptible in Europe."

SAINTE-BEUVE'S CORRESPONDENCE.

PARIS, February 22, 1878.

THE influence of Sainte-Beuve has been so important in French literature that even the scraps of his work are considered important. His literary executor, M. Troubat, has already published his correspondence with a princess (Princess Mathilde, the sister of Prince Napoleon, the daughter of King Jerome), and this first volume contained some very interesting letters. He is beginning now to publish the whole correspondence of Sainte-Beuve, and has given us a first volume, which extends from 1822 to 1869. Two other volumes will, I am informed, soon appear. There is no preface to the collection of letters; we therefore do not know on what principle M. Troubat has undertaken his work. We can only believe that he has adopted a merely chronological order; but we are surprised that Sainte-Beuve's correspondence between 1822 and 1869 has only furnished him the materials for a duodecimo volume. Such as it is, it deserves to be read, and it furnishes the proof that Sainte-Beuve was during his whole lifetime in a continuous state of development. The history of his mind is a long *werden*, to use a familiar expression of the Hegelian philosophy. He is always rising higher, always becoming more critical, more exacting towards himself; his intellectual horizon is always expanding. The Sainte-Beuve of 1822 is as different from the Sainte-Beuve of the latter part as a schoolboy from a well-formed and well-instructed man.

Sainte-Beuve began life as one of the minor *Romantiques*, to use a word much employed during the French Restoration. Full of affectations, a copyist rather than an original mind, he ended as a great critic, capable of judging Romanticists as well as Classicists, invigorated by the study of science; and he gave not only to literature, but to historical science, to philosophy, an impetus which is still felt and will be felt for many years. In the year 1822 he was only eighteen years old, and was still at school, attending the lectures of the Collége Bourbon. We find

him in correspondence at that age with an English classmate, who afterwards became a fellow at the University of Oxford. We see him under the influence of what was called then the spiritualist philosophy represented by M. Cousin, who was giving eloquent lectures at the Sorbonne. Spiritualism, under the Restoration, was a reaction against the sensualism of the eighteenth century and of the Revolution. "Cousin has begun the struggle against this hard and vivacious philosophy called sensualism." In 1838 Sainte-Beuve was of a quite different opinion. He wrote in his 'Causeries du Lundi':

"A philosophical iniquity was introduced in 1817 and consecrated in the following years. Cousin called the school of the eighteenth century, which attached ideas to sensations, the sensualist school. To be exact, he ought to have said sensationalist. The word sensualism implies the notion of a practical materialism which sacrifices to the senses; if this was true of some philosophers of the eighteenth century, of La Mettrie or Helvetius, it could not be applied to Condillac and to his honorable disciples, to the ideologues of Auteuil, the Thurots, the Daunous, who were sobriety itself.* But it is always well to dishonor your adversary; something of it will stick. A more scrupulous philosophical honesty would have disdained such means, but the audacious personage did not care for such trifles."

A bitter hatred of Cousin will be found in all the correspondence of Sainte-Beuve, and I could not help being struck, while perusing attentively the first two volumes of the 'Correspondence of Charles Sumner,' which have been sent to me, by the disagreeable impression which Sumner received from his first contact with Cousin. Sumner's nature was naturally open to admiration and sympathy; but he seems to have disliked Cousin as soon as he saw him. The most extraordinary letter of the new volume of Sainte-Beuve is probably the one which he wrote to Cousin in 1843, and in which he accuses him of having cut the ground from under his feet and used documents which he had himself furnished him almost confidentially:

"It is evident to all those who have read my second volume of 'Port Royal' that if you had allowed me to continue the study of Pascal I should have said on the 'Pensées' many of the things which you have so impetuously seized." . . . "It was from my hand that you received the manuscript in which you read for the first time the letters of Madame de Longueville."

Cousin published these letters, which Sainte-Beuve intended to use, and Sainte-Beuve says to him: "Now you lay hands on me again and help yourself at your convenience." Cousin, when this letter was written, considered himself the benefactor of Sainte-Beuve, as he had procured for him the place of librarian at the Mazarine Library; nevertheless, Sainte-Beuve says:

"Because I consented to be helped by you on an important occasion, which I cannot forget, I cannot bear such a want of courtesy. At any rate, I will complain to yourself and tell you what I feel on the subject. All these documents belong to everybody, and everybody is free to publish them; but the circumstances under which you have done so are such that if you had wished to discourage me in a work for which I have never asked the encouragement of anybody, you would not have acted differently."

This letter was a "tickler," which M. Cousin could not forgive; the philosopher and the critic became from that time secret enemies. It is rather painful to go behind the scenes of literature as we witness such a struggle; but on this occasion we cannot help siding with Sainte-Beuve, though there is not dignity enough in his legitimate anger.

We could find many other proofs of a certain want of breeding in the *Romantique* of former years. M. Dubois, professor of rhetoric at the Collége Charlemagne, who had had Sainte-Beuve among his pupils, became one of the founders of the *Globe*, a paper which had considerable reputation during the Restoration. He enlisted Sainte-Beuve among his contributors in 1828. Sainte-Beuve sold his first volume of poetry at that epoch for four hundred francs; he had written also in the *Revue de Paris*. His 'Joseph Delorme' had some success. Mme. de Broglie deigned to say that it was immoral; M. Guizot, that it was "du Werther jacobin et carabin." (We give the name of *carabin*, in France, to medical students who enter the army as surgeons.) The friends of Sainte-Beuve, or rather his patrons of the *Globe*, all became important personages after the Revolution of 1830. This revolution was partly their work. Sainte-Beuve remained in the shade: "To be and to remain out of everything is my wish and my destiny. From time to time, in a critical moment, I throw myself on the decisive spot, and then I return to my own paths." He could not choose a more deserted path than Port Royal; he left for years his active friends, his old Republican friends as well as the *doctrinaires* (such was the name given to the theorizers on constitutional government), and lived chiefly with the *solitaires* of Port Royal. In this moral solitude he did not gain the calm and the serenity of the "saints." He became more pugnacious, more jealous of his independence. In 1839 he writes to M. Villemain:

"Years even more than travel have taught me to do without my neighbors, even when the neighbor is full of graces; to believe less than ever in effective friendship, in disinterestedness; to see in all a great play with which many are contented, but which often makes me more impatient than I ought to be. Friendship, through all this, is surely sweet, and it can alone console. But friendship ought to be safe and not complicated with the ticklings of good or bad praise. And you have shown me that in your case, probably by my own fault, it becomes so complicated."

I have no doubt that such remarks were only a just retort. Sainte-Beuve was far superior to M. Villemain, and Villemain probably would treat him to the end like a schoolboy. He could not even bear that Sainte-Beuve should, at the request of the Countess Christina de Fontanes, write a laudatory article on M. de Fontanes, who had been grand master of the French University under Napoleon I., because he, Villemain, was grand master of the University. Sainte-Beuve tried to flatter with discretion, and thought, like Horace, that praise ought not to be flattery:

"Et admissus circum præcordia ludit."

"But," he remarks to Villemain, "I have been a *lourdaud* (a blockhead). To speak frankly, all our great men are a little spoiled. Coarse praise does not disgust them, not even the most delicate of them."

The study on 'Port Royal,' which, with all its defects, remains, in my opinion, the most solid title to glory of Sainte-Beuve, made of him a sort of *émigré*, or exile, during the years in which all his former friends and companions, Thiers, Cousin, Villemain, Guizot, grew to be the leaders of opinion in France. Paris had become for Sainte-Beuve merely the best place in which to judge the comedy. He was not an actor, he was a mere witness; and he knew the actors too well, he knew what was going on behind the scenes, and what petty passions were concealed under the tragic costumes and masks. He was contented with some modest post of observation. He had been named *conservateur* at the Mazarine Library; in 1844 he was elected to the French Academy. Villemain, who was his enemy as well as his Minister (the librarians of the Mazarine depend on the Minister of Public Instruction), sent him on this occasion the decoration of the Legion of Honor, which Sainte-Beuve had refused from his hands three years before. "You are," said Villemain, "the only Academician without the decoration, and the public who will be present at your reception would be astonished." Upon which Sainte-Beuve replies by a new refusal. "I cannot," he says, "see the affair in any other light than this, that I contradict myself publicly, and do so because I am forced. It is impossible for me, sir, to accept. I have lived with men (the Jansenists) who sacrificed all in order not to sign a formulary; it seemed childish, but they had their idea. I understand these men very well." At the same time Sainte-Beuve sent to M. Villemain his resignation as librarian. The resignation was not accepted, and Sainte-Beuve kept his post of librarian till 1848, without wearing the decoration of the Legion of Honor. His conduct would be more defensible if he had not accepted from Napoleon III. the dignity of officer, and even commander, of the Legion of Honor. He had, of course, the right to take from Napoleon III. what he would not take from Louis Philippe's ministers; but he would have been more consistent if he had refused everything from the hands of the mild sovereign who had the great defect in his eyes of choosing his Ministers of Public Instruction among men to whom Sainte-Beuve felt or thought himself superior.

His opposition to Louis Philippe was only half owing to his republicanism; it half proceeded from personal animosities and enmities which were only partly justified. It is painful to see Sainte-Beuve in dishabille in this correspondence, to hear the echo of his disputes with the terrible Buloz, of the *Revue des Deux Mondes*. He broke off his connection with the *Revue* in 1846, and found himself in consequence in a temporary embarrassment. He hoped for a moment to make a paper, or review, in which he would be completely independent; this dream was never realized. Fortunately, Sainte-Beuve needed very little; he lived till 1840 in a student's room. When he became, in 1843, a member of the Commission of the French Dictionary, lodged as he was at the Institute, as librarian of the Mazarine, he found it difficult to spend his revenue, and had to buy rare and curious books. He never wrote a line of politics after 1834, when he left the *National;* he was accused, however, after 1848 of having received sums of money from the secret funds; but he proved that the sum found with his name in the papers of M. de Montalivet was for the repairs of a chimney, which smoked, in the Mazarine Library. This miserable affair (the sum in question was only one hundred francs) caused

Sainte-Beuve infinite trouble; for a moment his honor was in danger, because his chimney had smoked and because M. de Montalivet had not made any mention of the nature of the expenses which he had ordered.

When you begin with Sainte-Beuve you cannot help being interested; I have not gone over more than one-half of the correspondence of this first volume, but as the two others will soon appear I shall be able to return to the same subject.

Correspondence.

PRESIDENT ELIOT ON PRELIMINARY EXAMINATIONS.

To the Editor of The Nation:

Sir: Will you allow me to call attention in your journal to a very interesting and suggestive change in the educational ideas of a very eminent educationist?

In the year 1870 the University of Michigan announced that on the application of any high-school in Michigan the Faculty would send a committee for the purpose of examining such school, and that, if the amount and quality of instruction were found to be in all respects satisfactory, students presenting at the University certificates of having fully completed the prescribed course in any such accepted school might be admitted to the University without an entrance examination. Three years later an announcement identical in spirit and purpose, and almost identical in form, was made by the universities of Oxford and Cambridge to preparatory schools in England. It is to certain comments on these announcements that I desire to call attention.

In President Eliot's annual report for 1873–74, p. 11, the following words were used:

"The University of Michigan, which has no preparatory department, admits graduates of the public schools of Michigan without examination, upon certificates given by the local school-boards. The only check upon the school-boards retained by the University is the annual visit by a committee of the faculty to every public high-school in Michigan which desires to use this privilege of sending its graduates to the University without examination. The faculty must be satisfied from the report of this committee that the school is in good condition. *All teachers will feel that such a check upon the action of school-boards must necessarily prove ineffective. That the University should have been willing to try so unpromising an experiment proves that the lack of connection between the secondary and the higher instruction in Michigan must have been painfully felt.*"

In the last number of the *North American Review*, p. 225, President Eliot's comments on the corresponding announcement of the English universities are as follows:

"Much more interesting than the local examinations are the examinations of schools and the examinations for certificates recently instituted by Oxford and Cambridge acting together through a board made up of fourteen members from each university. The schools examined are schools which are competent to prepare boys for the universities, and the certificates exempt their holders from the college entrance examination at Oxford and Cambridge. This work, though elementary, is strictly relevant to the object of the universities so far as it is done for schools which prepare for the universities. . . . *American teachers will find these school and certificate examinations very suggestive; their method is one which, with some modifications, would be in many respects applicable to those schools in the United States, whether private, endowed, or public, which prepare boys for college.*"

Is President Eliot here graciously retracting his hasty condemnation of the Michigan method, or is this merely an interesting reciprocation of what Mr. Lowell so felicitously described as "a certain condescension in foreigners"?

C. K.

Ann Arbor, Mich., March 15, 1878.

SILVER-MEN'S FINANCE.

To the Editor of The Nation:

Sir: A friend of mine heard, a few days since, a conversation which was so thoroughly characteristic of the silver-men's loose methods of thought, and at the same time so absurd, that I take the liberty of sending you an account of it.

The scene was a hotel dining-room in Toronto, and the actors an American gentleman, and a Canadian lady in search of information in regard to United States securities.

She enquired as to the probable effect of the passage of the Silver Bill on the value of United States bonds. He told her she need not be alarmed in regard to that, as all the United States bonds were payable in London, and the Government would, of course, be obliged to pay them in gold coin. She then asked how the Government could get the necessary amount of gold coin, if the duties were paid in silver. He told her that a plentiful supply of gold would easily be obtained in the Clearing-house. She looked a little surprised at this, and asked what the Clearing-house was and where it was situated; upon which he said that he believed it was in London, and was an office to which different governments sent representatives at stated periods, who settled in gold coin the balances due from one country to another, on account of the balance of trade. Of course, as the balance of trade between the United States and England was now largely in our favor, a large amount in gold would be due us, which the Government could easily use for paying the interest on its bonds.

Before finishing the conversation, the gentleman said that he was a silver-man, and represented his town in the legislature; but unfortunately my friend was unable to learn where he lived.

I remain, dear sir, yours very respectfully,

Charles E. Brooks.

Cleveland, O., March 12, 1878.

THE NEW FIELD FOR COUNTERFEITERS.

To the Editor of The Nation:

Sir: I believe that no mention has been made by the press, in the discussion of the silver question, of an element which may become important, viz.: the inducement offered by the present law for surreptitious coinage of silver dollars of full standard value. Under the law, the Government realizes a scigniorage of eight or nine per cent. The small amount to be issued by the Mint will keep up nearly to par for some time, continuing this high rate of profit. With so large a margin of profit, and so little danger of detection of a counterfeit equal in weight and value to the genuine, surreptitious coinage will be highly remunerative, and will undoubtedly occur, both in our own and in foreign countries. The expense of coinage is very slight, as indicated by the fact that our nickel coins have been counterfeited with profit.

Canada and Mexico offer convenient fields of operation, whence the coin could be readily distributed with comparative immunity from punishment. Large quantities of Mexican* silver dollars have been introduced into the United States, during the present winter, in exchange for greenbacks wanted for purposes of exchange in Mexico, yielding a handsome percentage to the brokers and manufacturers through whom they found their way into circulation.

Is it not probable that this form of counterfeiting will be so extensive as to increase materially the $48,000,000 per annum provided for by law, and produce a marked effect on the final results of the silver legislation?

H. H. Hart.

Cambridge, Mass., March 13, 1878.

Notes.

D. APPLETON & CO. will shortly publish a new work by Mr. George B. Prescott, author of 'Electricity and the Electric Telegraph,' on 'The Speaking Telephone and Other Electrical Novelties,' a subject which he also treats, more briefly, in the current *Scribner's*. The press can hardly keep pace with these marvellous inventions.——Vol. XV. of *Scribner's* is equipped with an eight-page index, more minute than any of its predecessors. A further improvement would be an indexing by authors, however condensed (and it would not require much space). For instance, Robert Dale Owen's "Recallings from a Public Life" would most naturally be sought for under his name.—— *Church's Musical Visitor*, Cincinnati, has begun publishing a translation of Karasowski's 'Life of Chopin,' which we noticed last summer.——Architects, sculptors, builders, druggists, wall-paper makers and other manufacturers, as well as all those who have caught the ceramic contagion of the day, ought to possess themselves of the information contained in the last volume of the Geological Survey of New Jersey. Prof. Cook's 'Report on the Clay Deposits of Woodbridge, South Amboy, and Other Places in New Jersey, together with their uses for fire-brick, pottery, etc.,' makes an octavo volume of nearly 400 pages, and is accompanied by a large map of the clay district nearest New York, which gives ample promise of being the Staffordshire of America.——The General Meeting of the American Social Science Association for 1878 will be held in Cincinnati, beginning Saturday, May

18. The topics of papers already announced are largely politico-economical, the silver question being set down for Tuesday, and taxation, banking, post-office savings-banks, the relation of Government to railways, restricted suffrage, the patent system, intellectual property, etc., occupying the rest of the time. Prof. Benjamin Peirce, Prof. T. M. Cooley, Prof. N. S. Shaler, W. T. Groesbeck, S. Dana Horton, Horace White, Simon Sterne, Gamaliel Bradford, and F. B. Sanborn are amongst the best-known names of the participants.—Moore's 'Poetical Works,' six volumes in three, and Chatterton's, two volumes in one, with the usual prefatory memoirs, are the latest issues of the Riverside edition of the British Poets.

—Lockwood, Brooks & Co., Boston, write us as follows:

"In the review of the 'Primer of Piano-Forte Playing,' in your last issue, regret is expressed that no translation has ever been made of Wieck's 'Clavier und Gesang.' Evidently the *Nation* has nodded. We beg to call your attention to our 'Piano and Song,' a copy of which we mail you to-day. As the infallibility of the *Nation* is generally unquestioned, we shall hope to see last week's mistake corrected, and should be pleased to see in your columns a review of our translation of 'Clavier und Gesang.'"

We instantly comply with this request for a review by pronouncing the translation in question poor and unsatisfactory; and we save our infallibility by asserting that we were familiar with 'Piano and Song,' and that we weighed our words, when we wrote—not that "no translation has ever been made" of Wieck's manual, but that "we have often wished that some *competent* person would undertake the task of translating it."

—Mrs. Wister wrote us, March 12, too late for insertion last week, as follows:

"At a meeting of the Philadelphia Local Committee, held yesterday, the first since my letter of February 4 to the *Nation*, the secretary was directed by the committee to request me to state in your columns that it was written without the knowledge of the committee. I have only to confirm this myself; the letter was written entirely on my own responsibility and shown to no one before its publication. You will oblige me extremely by giving this note a place this week if possible."

. . . . . .

"Since I last wrote to you I have made a very mortifying discovery, viz.: that chemistry *is* mentioned among the studies of the University of Pennsylvania in the Catalogue for 1876–7. I cannot tell how I came to overlook it in the scores of times that I read over the "Course of Instruction"; I opened the catalogue the other day and there it was as if somebody had put it there since I last looked, the last study in the Sophomore year: 'Chemistry, Introduction to Modern Chemistry, Lectures.'

"I can account for it only in the same way that I do for enumerating nine branches as required by the Harvard female examination and then speaking of them as seven, by my having been constantly indisposed since New Year, and very unfit for this correspondence. It is a matter of no consequence in itself, or to you, or the public, but of some to me and my adversaries."

—A curious instance of the self-preserving skill with which society manages to repair the errors of law-makers is to be seen in the protection accorded in this country to foreign plays, in spite of the absence of international copyright. A foreign novel can be published here by any one, but a foreign play cannot be performed here by any one as long as the author cares to protect it. As long as a literary work is unpublished it is the personal property of its author, protected by the common law, and needing no copyright legislation. As soon as it is "dedicated to the public"—*i. e.*, published—it ceases to be the author's except in so far as a copyright act may have given him the control of it; beyond the reach of the copyright law he has no rights. This dedication requires that it shall be printed and sold over the counter, like any other book. As long, then, as a foreign author keeps his play in MS., he or his assignee can control its performance here. Such was the view of the law generally held, and it has just been forcibly affirmed in the United States Circuit Court in Baltimore. Messrs. Shook and Palmer, as assignees of M. Dennery, a Frenchman, and the author of the "Celebrated Case," a play now running at their theatre, the Union Square, in this city, sought to enjoin Gilmore from producing a version of the same play in Baltimore. Gilmore alleged that his play was elaborated from the reports and criticisms of the French play in the newspapers, and that the plaintiffs and their assignor had by permitting these newspaper reports in so far published the play. The court paid no attention to this plea, and granted a perpetual injunction against the performing by Gilmore of the "Celebrated Case," or any colorable imitation of it; so that Messrs. Shook and Palmer are assured of the enjoyment of their purchase until M. Dennery shall publish the play, when it will at once become public property in this country. A second case of superficial similarity has been decided in the courts of this city. Messrs. Tompkins and Hill, of Boston, sought to enjoin the performance of the "Exiles" at the Broadway Theatre, alleging that they were the assignees of the French authors, MM. Nus, Sardou, and Lubomirski, whose play was not published. The injunction was denied, because, although the defendant did not contest plaintiffs' title to their play, a dramatization by MM. Nus and Sardou of a novel by Prince Lubomirski, he showed that his play was an independent adaptation of the same novel, the novel being published, and therefore public property.

—The January number of the *Law Review* contains an article on the Parliaments of France, by Mr. James B. Perkins. It is mainly descriptive, but suggests speculations of an interesting kind as to the causes of the early decay and death in France of all institutions which appear to have contained the germs of a healthy and well-balanced constitution. From the French Parliaments there seemed, at one time, to be reason to expect a good deal. They were ancient courts, their origin dating back to feudal times, but had been at the same time modernized by an infusion of professional blood. Their members were wealthy and powerful, and at different times engaged in a struggle with the monarchy which ought to have promised something for popular rights. But the struggle always ended badly for the Parliaments that engaged in it, and the monarchy went on increasing in power. Mr. Chauncey Smith contributes a valuable article on the amendment of the patent laws, in which he makes several suggestions to which his distinguished position as a patent-lawyer lends great weight. The most important of these is with a view to diminishing the number of useless patents issued. Three-quarters of the patents taken out are for inventions that, for one reason or another, are never introduced to the public by the inventor; he has no means of pushing them, or he finds that they are old or not needed in the market. Hence the Patent Office is clogged with inventions of no use to anybody, but which make the investigation of all questions of facts connected with patents very difficult. To remedy this Mr. Smith suggests the adoption of the English law which requires the payment of a small fee within a certain time from the issue of the patent, the patent lapsing altogether if the fee is not paid. This simple provision in England causes the disappearance of most of the patents issued within a few years of their issue. Of course if the patent is likely to be of any value, the inventor will pay the fee; if not, it is for the interest of every other inventor and of the public that his patent should be dropped from the rolls, while to him it makes no difference what is done with it.

—The *International Review* for March-April contains a reply by Mr. A. H. Stephens to some remarks of a disparaging character with reference to himself contained in General Richard Taylor's war reminiscences in the *North American*. General Taylor's feelings towards certain Confederate politicians bear a close resemblance, the difference of latitude being taken into account, to those entertained on the Northern side by stanch supporters of McClellan towards certain politicians at Washington. Most of all, he seems to have had a grudge against Mr. Stephens, whose statesmanship he calls in question for his proclamation of slavery as "the corner-stone of the Confederacy," and whose knowledge of the art of war he describes as being very limited. The view taken of the war by the Vice-President of the Confederacy General Taylor describes as follows: "The war was for principles and rights. It was in the defence of these and of their property that the people had taken up arms. They could always be relied upon when a battle was imminent; but when there was no fighting to be done, they had best be at home attending to their families and interests. As their intelligence was equal to their patriotism, they were as capable of judging of the necessity of their presence with the 'colors' as the commanders of armies, who were but professional soldiers, fighting for rank and pay—most of them without property in the South." He further accused Mr. Stephens of displaying in July, 1865, and in Washington, a reprehensible coldness and indifference to the fate of Jefferson Davis, then a prisoner at Fortress Monroe. To all these charges Mr. Stephens now replies in the solemn political manner much used in the South a generation ago. He begins by admitting that reminiscences such as General Taylor's are "usually interesting," and, when accurate, are useful; that the facts they contain are "footlights" which illumine the stage of history; but he intimates that when not accurate they serve no such purpose. He then proceeds to light up the scene with what he says are "not mere footlights" but "mid-dome chandeliers," in the shape of certain public records which demonstrate that he was himself one of the foremost promoters of the war, and proceeds to declare that the military theories of a defence of the South by voluntary rallies and agricultural dispersals of troops attributed to him are but the fig-

ments of a disordered imagination." Not satisfied with this, he goes on to explain his "corner-stone" speech, which was, he says, nothing more than a laudable effort to show that in this country there was no such thing as slavery," but only "a legal subordination of the admitted inferior to the superior." Lastly, he declares that the story of his chilly indifference to the sufferings of Jefferson Davis is "a perfect Munchausenism," he (Mr. Stephens) being at the time mentioned himself in prison at Fort Warren. On this last point the venerable ex-Vice-President of the Confederacy seems to have been guilty of a little quibble, inasmuch as the point of the accusation, if it can be said to have had any point, lay in the fact of such an interview having taken place—not the particular date of it. As to this, General Taylor now admits that he was mistaken. It is a very pretty symposium as it stands.

—One of the "signs of the times" which has long attracted attention in the ecclesiastical world is the tendency to a more liturgical way of doing things in the Puritan churches. The liturgical spirit has found its chief revelling-place in the Sunday-school, in which a series of "concert exercises" has been prepared and performed during the past ten or fifteen years sufficient to make the most aggressive liturgical reformer stand aghast. One can readily imagine how much has been done in this way to cultivate the æsthetic nature of the youthful Christians of America. But it was reserved for the year of grace 1878 to give to the world a "concert exercise" combining in proper proportions the æsthetic and the practical. It comes to us from a village in Massachusetts, and is circulated in behalf of a prominent missionary society which has its headquarters in this city. The programme consists of twenty-four items, including five hymns, each with a chorus, all of them selected from the latest hymn-book of the season, 'Gospel Songs, No. 2.' The "exercise" begins as follows: "1. Singing: Rescue the Perishing. 2. Read in concert or responsive [*sic*] Psalm lxxii. 3. Prayer." And then it plunges *in medias res*, with a superb disregard of the ecclesiastical tone and spirit, by asking: "4. What is the American Missionary Association?" To this the answer is given by Scholar "A" that "it is an association of Christian men, organized in 1846, to diffuse a knowledge," etc., etc. Then follows: "5. What is it doing at the present time?" to which Scholar "B" replies: "It sustains fifty-nine churches among the freedmen at the South, one church in Africa," etc. After each scholar, down to "G," has contributed an item to this impressive summary, the second hymn is sung, "I have a Saviour, he's pleading in glory," and the next question is sprung upon us: "7. How is the money raised?" to which "H" replies: "Last year the association received from bequests and from churches . . . a little more than $200,000; but they needed more than $300,000 to carry on their work successfully"; and "I" adds: "The greatest sacrifices are made in the Southern States. In one colored Sunday-school every pupil gives five cents a month. . . . Little colored children, who have hardly respectable clothing, have such a love for this association that they save the pennies to give into its treasury." This aspect of the "work" seems to have grown upon the compiler of the "exercise," for at this point he introduces an entire page of "incidents from the work among the freedmen," in the well-known style of the missionary magazines; after which this new Socratic method is applied to the case of the Indians. It is in this division that we find the most beautiful instance of adaptation of part to part afforded by the entire programme. The question is: "14. Does it pay, from the Government standpoint, to Christianize the Indians?" Little-boy "Q" replies: "It has cost the Government $12,000,000 a year on the average for forty years to fight the unchristian tribes"; and little-boy "R" answers in prompt response: "It has cost almost nothing to control the Christian tribes"; whereupon follows "singing by the children (with chorus): 'The mistakes of my life have been many'!" The adaptation, as we have said, is very neat indeed, but there remains a doubt whether this musical statement about mistakes applies to the Government or to the aborigines. The song, however, is followed immediately by "16. Prayer for the Indians"; after which the worshipping assembly, under the lead of our missionary liturgist, marches unthinkingly forward to "17. Can the Chinese be Christianized?"—a conundrum which we leave without its answer, somewhat on the same principle that periodicals which publish serial stories make the week's instalment end at the most exciting point. The programme is issued, as any one can see, not for liturgical reasons, but to "replenish the treasury of the A. M. A." We therefore add a further statement, which we find on the printed slip accompanying it: "To make this a success, you ought to have thirty copies." Whether the treasury of the A. M. A. will receive a replenishing remains to be seen; but, meantime, what is the effect of such productions as this upon the tastes and the reverence, and therefore upon the morals, of those who are passing to-day through the Sunday-school into the arena of a busy life?

—The ninth volume of the 'Archives de la Bastille' (Paris, 1877), edited by François Ravaisson, relates to the years 1687-92 of the reign of Louis XIV. The documents consist principally of reports of the police, extracts from the journal of the lieutenant of the Bastille, and letters of the king and his ministers. At this time a large proportion of the prisoners were either persons confined for their religious opinions or English spies. The best known of the former class, whose name appears in this volume, is the famous quietist, Mme. Guyon. Though not actually sent to the Bastille till 1698, proceedings commenced against her in 1687. The letters and memoranda in regard to her case, and the controversy between Fénelon and Bossuet which grew out of it, are numerous. We have room but for one, a note of the king to Mme. Maintenon, dated "Mars 1699, à midi": "There has just come a courier from Rome, who brings the condemnation of the Archbishop of Cambray. I send it to you in this packet that you may see the full details. It is Latin; some Father of the Mission will explain it to you. There's an affair finished happily. I hope that it will have no more painful consequences for any one. I shall say nothing more of it to you at this time; it shall be for this evening." The most of this class, however, were Protestants. For some time previous the provisions of the Edict of Nantes had been but laxly enforced, and a large number of Protestant pastors especially took advantage of this to come from England and Holland to visit their former flocks, to confirm their faith, and to administer the religious rites. Not unnaturally Louis regarded them as very likely to prove spies of his most formidable enemy, William of Orange, and great numbers were arrested and put to death or imprisoned. One of the more interesting miscellaneous cases was that of Herse, a tailor's apprentice, described as "un petit garçon," who was condemned to a life imprisonment for saying that he would like to kill the king.

—The larger part of the volume is devoted to the English spies, and considerable light is thrown upon the life of the court at St. Germain. It is very evident from these documents that William was far better served than James, some of the latter's most trusted spies being in William's pay, as were also the chief counsellors of the banished king. A striking picture is drawn of one of these pretended Jacobite spies, Jones Simpson, a Scotchman, making his report to William at Kensington. One is rather surprised to find amongst them also the name of Vanbrugh, the dramatist and architect. He was arrested at Calais for travelling without a passport, and though nothing seems to have been proved against him, he was confined nearly two years, being allowed in the last few months to walk in the court-yard on giving £10,000 security that he would not attempt to escape. The most singular case is, perhaps, that of Broomfield, described as "quaker ou trembleur," who is imprisoned as a "suspect" three or four times within ten years. The following is an extract from the journal of M. Du Junca, the lieutenant of the tower, concerning him: "On Thursday, January 22, 1702, at 4 P.M., the governor having received a command to set M. Broomfield, English and quaker, at liberty, on condition that he promise to leave the kingdom as soon as possible; but the king having been informed that he had a valuable secret for the construction of boats with machinery for moving them rapidly (*pour aller fort vite*) without oars, sails, or horses on the rivers, the king desires that he should remain in order to carry out with M. de Pointis (*chef d'escadre*) this enterprise and the construction of the boats." Nothing seems to have come of this secret, for we find Broomfield again in the Bastille three months later. In 1711 he was still a prisoner. The tortures used in the Bastille were confined to the "boots" and "water," the latter consisting in the pouring successive pints of water into the mouth of the victim.

—After an interval of four years, Karl Goedeke has published the tenth part of his great work 'Grundriss zur Geschichte der deutschen Dichtung' (Dresden, 1862-77). In this is concluded the bibliography of the German drama down to 1830, and the lyric poets of the first half of the century are taken up. The authors are arranged in a somewhat arbitrary order under their various countries, with short biographical sketches. The lists of their writings in some cases extend to their magazine pieces.——The *Rundschau* for February publishes "Letters from Paris by Graf von Moltke." They were written in December, 1856, when he accompanied, as adjutant, the Crown Prince in his journey to London and Paris. Like the "Letters from Russia" they originally appeared some years ago in a Danish translation in the *Dagens Nyheder*. The

letters in the *Rundschau* are printed from a manuscript furnished to the editors by Von Moltke himself.——Prof. Dr. Daniel Sanders intends issuing this year the first instalments of a Supplement to his Dictionary of the German Language (*Ergänzungswörterbuch der deutschen Sprache*), and desires to be informed of any errors or omissions in the original work, or of any desirable improvements of any kind. His address is Altstrelitz, Mecklenburg. Sanders's 'Aus den besten Lebensstunden' is to be brought out by the same publisher (Abenheim of Stuttgart) in gift-book style.——The first German periodical ever published in Holland appears this year in the interest of the German population of the Netherlands. It is called *Holländische Nachrichten. Noord en Zuid* is the name of a new philological quarterly, of a popular character, edited by T. H. de Beer, of Amsterdam, and published at Eulemborg by Blom & Olivierse. ——From B. Westermann & Co. we have Part 19 of 'Spruner's Historical Atlas.' Three of the four maps show the Mongolian and Ottoman dominions prior to the taking of Constantinople. The previous number was wholly devoted to the Orient, of which the series is now finished, and embraces fifteen sheets and forty-nine side-maps. Four more numbers will complete this invaluable atlas. The German publisher is Justus Perthes, Gotha.

INGLEBY'S SHAKESPEARE.*

DR. C. M. INGLEBY, the well-known Shakespeare scholar, has been reminded by a letter of Faraday that "it is useful to get one's scattered papers together, with an index," and he has begun the work by a collection of ten chapters, six on "Shakespeare the Man," and four on "Shakespeare the Book." The first chapter treats of the spelling of the poet's surname, and the second of its meaning. There ought to be a third on its pronunciation. So far as the printed literature of the poet's age is concerned the whole matter is plain. The books of the poet himself, of Ben Jonson, and all the rest give us his name as a compound of *Shake* and *spear* (*speare*). They all spell it so. They sometimes put a hyphen between the parts, and they play upon its meaning. They evidently pronounced it as the separate words were pronounced in London, with what we may call the French sounds of the vowels. But when we pry into the written records of the time we learn that all this is literary or polite interpretation. The real name as spoken in Stratford and thereabouts sounded in the mouths of the family and their friends *Shăkspĕr, Sĭkspĕr, Shĭgspir, Shăkuspr, Sĭckesper, Shackespher*, and the like. The rustic clerks have exemplified very handsomely the capacities of the English alphabet, and have left in the records some scores of spellings, of which Mr. Ingleby gives a couple of pages of specimens. The last will and testament of the poet still lies there, a little faded and worn since it left his hands in 1616, but with his final signature unmarred and now understood to be *Shakspere*, though quite illegible to the uninitiated, and long read by the antiquaries as *Shakspeare*. In this state of facts it was not to be supposed that modern criticism would rest in the old ways and opinions of the age of Elizabeth and James. The pronunciation, indeed, of the Stratford folks no one has proposed to revert to, unless, perhaps, "High Life below Stairs" may be taken in that sense, when Lady Bab asks, "Did you never read Shikspur?" "Shikspur? Shikspur? Who wrote it?" But the etymologists have been busy. Mr. Ingleby thinks five new derivations worth mentioning. According to these the Stratford name was a corruption of the French *Jacques Pierre, i.e. James Peter*, or of the Saxon *Sigisbert* (the Frenchman who printed in 1777 *Saxespeart* on his title-page, and the forger of the 'Revels-Books' of 1605, who writes *Shaxberd*, spelt wiser than they knew), or it may have been the German *Schachsburh, i.e. Isaac's-bury*, or Celtic *Schacspeir, i.e. Dry-legs*, or *Lapus Biragus*, the name of a Florentine historian from whom the etymologist hopes the family were descended.

The biographical antiquarians are, however, the most successful innovators. As long as they read the signature of the poet's will *Shakspeare*, many of them insisted on using that spelling; and now they insist on *Shakspere*. Mr. Furnivall, the director of the "New Shakspere Society," has the following remarks, as a sort of christening speech in the prospectus of his new society: "Though it has hitherto been too much to ask people to suppose that Shakspere knew how to spell his own name, I hope the demand may not prove too great for the imagination of the members of the new society." And he finds this flout worth repeating in his introduction to the 'Leopold Shakspere.' Mr. Ingleby makes serious answer that there was no such thing as orthography or standard spelling in the poet's time, and gives variant spellings by the dozen, which he has found of *Jonson, Raleigh, Decker, Hall*, and others, as well as those of *Shakspere* from the poet's brother Gilbert, the records, and the printed poems. In view of all these it would seem to be something better than giving Mr. Furnivall a quillet for his quip, if one were to answer him that it is really too much to ask of a student of these times to suppose Shakespeare such a dullard as to know only one way of spelling his name. Most such students will agree with Mr. Ingleby to use the form which was bequeathed us by the poet's friends, approved by himself in his two printed dedications to Lord Southampton, and which, with hardly an exception, was adopted by his printers, viz., Shakespeare. So says Halliwell, and with him, in our generation, are the great Cambridge edition; the American editions of White, Hudson, Furness; the English "Shakespeare Society," the German "Shakespeare-gesellschaft," and the great host. Nevertheless, there will always be some, and those of the best, who will prefer to follow the Stratford spelling and their own eyesight, just as there are those who always write *Chauvin* for *Calvin*, and *Schwarzerd* for *Melanchthon*. As we find the matter discussed, it does not seem to be worth contending about.

There is, however, a point of view which we do not find discussed, from which a ray of light seems to be thrown by the change of spelling deep into the character of the poet. We country folk in America know well the man who comes back from the city with his signature of as new a fashion as his coat, the Smith who has become Smyth, the Delano who has become De Laney, the Kittle who has become Kettelle. Had the great dramatist some of that blood in his veins? He tried to get the Herald's College to issue a coat of arms to his father down in Stratford. Was the change from *Shaxper* to *Shake-speare* another case of Tromes turned to Atrometus, so that his name might, like his muse, heroically sound?

Mr. Ingleby's third chapter is on the poet's birthday, defending the tradition. Chapter iv. points out that a large part of the plays are made out of earlier plays, or other works, with so free a hand that the earlier authors might in some sense lay claim to them. Chapter v. is on "the portraiture of Shakespeare." Mr. Ingleby here gives us mainly destructive criticism. He holds that a large part of every portrait is subjective, contributed by the painter from his own ideals, and that no one has given us a Shakespeare from a worthy ideal. He rejects as a monstrosity the engraving whose likeness Ben Jonson vouches for, pronounces the Stratford bust *clownish*, and the late American portraiture by Ward feeble and untrue. "We ne'er shall look upon his like again." The artists will not fail to retort that what a critic sees in a work of art is largely subjective, contributed by the critic from ideals of his own; and if Mr. Ingleby cannot see Shakespeare in accredited portraitures, so much the worse for Mr. Ingleby. It would be a good work for the New Shakspere Society to give us copies of all the portraitures of the poet, with complete accounts of all that is known and all that has been conjectured about them. Is it sacrilegious to ask whether it is wholly impossible to verify the supposition that the Stratford bust is from a death-mask? Would not the present age permit a tender and reverential scientific examination of the grave of Shakespeare?

One of Mr. Ingleby's incidental remarks in this chapter is quite as suggestive as the main discussion. "There is scarcely a poet of Shakespeare's time," he says, "above mediocrity who has not written commendatory verses on his fellows. We do not know of a single copy of such verses by Shakespeare." "Can it be," he adds, "that the poor player was evidently despised; that he was too humble to be selected as the subject of much eulogy in those early times, or to be invited to become the eulogist of another?" Another solution may be hazarded—heterodox, certainly, but perhaps worth printing—that the great dramatist was not fertile in that kind of production. He was certainly accessible both by position and temper. If he had been facile and happy, throwing off such brave lines of praise as we should look for from him who in *Midsummer Night's Dream* described the poet and complimented the queen, it is not in human nature to neglect them. The fact is, let us say, that a sense of fitness, of congruity between character, circumstances, and speech tyrannized over his imagination, and that the Stratford peasant and London actor speaking in his own person about real matters was not on any lofty plane, and could not talk as if he were. The sonnet was the key with which he unlocked his heart. But the sonnets are on the whole unimaginative, repetitious, barren. The poems are also on a low plane; their most striking quality is elaborate and accurate realistic observation. They seem to come hard, like Thackeray's early work. It is only when Shakespeare

* 'Shakespeare: The Man and the Book. Being a Collection of Occasional Papers on the Bard and his Writings. Part I. By C. M. Ingleby, M.A., LL.D., V.P.R.S.L.' London: Trübner & Co. 1877.

takes on some other character that he can erect himself above himself and use his wings freely. And so eulogistic verses were not much in his line. Besides, a man that wrote such an abominable hand must have hated to touch a pen.

Mr. Ingleby's last chapter, on "The man, Shakespeare," treats of the disappearance of his papers, and suggests that he may have left them with Jonson and that they were destroyed by fire with Jonson's own manuscripts. He also traces up the myth of Shakespeare's lameness.

The four chapters on "Shakespeare, the book" discuss the danger of mangling him by revising his text into conformity with modern grammar rules—a danger, we judge, now fast passing away; "the idiosyncrasy of Hamlet," the most striking part of which is a comparison of *Hamlet's* "madness" to Byron's; and six passages which are expounded and defended: "As You Like It," ii. 1:

"Here feele we not the penaltie of *Adam*"—

where for *not* he suggests *now*, which makes perfect sense. The text as it stands will, however, give nearly the same sense if read as a question, and it be taken for granted that it is a privilege to feel the "penaltie of Adam"—*i.e.*, the change of seasons, a mode of thinking not unnatural in Arcadia or in the forest of Arden. Somewhat in this vein runs the old hymn of Abelard:

"Sole calet in hieme
Qui caret ignis munere.

In vera cœli camera
Pauper jacet pulcherrima"

Then there is a discussion of Sonnet cxlvi. 1, 2:

"Poore soule the center of my sinfull earth,
My sinfull earth these rebbel powres that thee array."

For *My sinfull earth* he proposes, on the suggestion of Mr. Brae, to read *Leagued with*, carrying out the thought in *sinful* with a certain barren elaboration perhaps not altogether out of place in interpreting the sonnets. But Mr. Ingleby's own suggestion, *Seat of*, is far better. The talk afterwards is of a *mansion* and its *walls*, and *seat* is also Shakespearian here in jingle of sound. Mr. Ingleby's main point is, however, that *array* means *ill-treat*. In the other passages he defends difficult readings of the folio, if not always quite conclusively, yet so as to show that they make some sort of sense, which is good work. Our thanks to Mr. Ingleby.

RECENT NOVELS.*

'THE Story of Avis' is mainly an account of the unhappy married life of a young New-England woman who was fond of painting. She had not the usual feminine accomplishments—or, at least, what are commonly considered the usual accomplishments, a knowledge of cooking, housekeeping, managing servants, etc.—and consequently she made the acquaintance of various forms of misery that she would never have known if she had lived in her father's house and let her Martha-like aunt see about the dinners and the faults of the "help." She was well aware of her ignorance of practical things, and after six years of study abroad she came back to this country with the intention of eschewing matrimony and of leading her own independent life of artistic work; but fate prevailed over this resolution in its usual way. It was the handsome young tutor in the college in the town who won her hand; and it was not so much the charm of his appearance, and of his "musical," "vibrant," "delirious" voice, as the fact that he went to the wars on her account and was wounded, that persuaded her reluctantly to marry him. This man, Philip Ostrander, turned out after the wedding to have a nature that corresponded but ill with his fair exterior. He was selfish; he asked men unexpectedly to dinner; he let his wife pay the bills by selling her pictures; he complained of his food on no greater provocation than that the cream was sour, the steak cold, and the cracked wheat soggy. When the babies came, Avis had no time for painting. Moreover, it transpired that Ostrander had been engaged to a girl in his country home, who, after he had jilted her, had married another man who maltreated her, so that her professional calls as a book-agent at the Ostrander's were doubly terrible. Worse than this, Ostrander flirted with a young woman, a friend of his wife's, when that lady was sick up-stairs; and then things came to a crisis.

This brief recital by no means exhausts the gloomy incidents of the story, which ends with Avis's married life a failure and her power of painting gone. Under the guise of fiction the book is really a protest against marriage. If Avis had not accepted Ostrander, she might have painted pictures and become famous, instead of wasting her life in struggles with cook's bills, her babies' clothes, and her husband's selfishness. As it was, she sacrificed her life by a great mistake, and not only is the world poorer in not having her paintings, but her married life was not of a sort to cheer the sentimental reader. Miss Phelps has shown herself an apt pupil of George Eliot, not so much in point of style (for the American author, although she apparently strives to get the right expressions and the accurate epithet, is more frequently eccentric and provincial than successful), but with regard to detestations of modern society. The influence of the greater novelist is to be seen on every page, so that it may be fair to wonder whether this novel would have been written if 'Middlemarch' had not appeared. Not that Miss Phelps is a plagiarist; she has merely seen the literary value of men's selfishness and has written her book to condemn it as it deserves. The incidents are all probable enough; no ordinary observer can have failed to collect a large mass of corroborative testimony of the unhappiness of many marriages, but what Miss Phelps gives no place to is the fact that Avis's own love for her husband, which survived his careless treatment of her, could not have failed to give her some consolation. Then, too, there is a monotony in her misery which is without interlude of affection, humor, or cheerfulness, so that the reader's sympathy for the New-England Dorothea is perpetually on the rack.

In spite of their unfortunate setting, the passages which describe Avis's reluctance to lose her unwedded freedom are excellently done. There are bursts of truth, and of rarely expressed truth, which lift the book far above the mere record of conjugal infelicity. And, although invention is in no way the author's strong point, her imagination relieves the sombre monotony of the sordid incidents she has strung together for the confusion of men. Avis was a fine woman, and she married a man who was but a poor creature, but it will be hard by writing novels to prevent men from wanting to marry, and if women make the wrong choice it is not fair to throw all the blame on the men. In fact, Avis ought to have applied for a divorce the moment "he came home from the lecture-room over-wearied, holding out his still thin hands, and asked her to strike a few chords for him upon the piano, saying, as he did so:

"Harmony, harmony! Avis, I am spent for a touch of harmony.'"

No one could have been happy with such an affected man. But, seriously, the story, although a painful one and full of petty exaggeration, rests on the solid ground of fact; it is only a pity that the effect of the whole should be so much injured as it is by the unnaturalness of Ostrander, who has all the faults, this side of wife-beating and vice, of a married man, and by the unrelieved wretchedness of the heroine. The days have gone by, apparently, when young people will get romantic ideas of life from novels.

Nevertheless Mr. Justin McCarthy plods the beaten track. He turns off a novel as patiently as a bricklayer will lay bricks, and it is curious to see what a lifeless history of inanimate beings he puts together for the entertainment of readers. It seems hardly polite to call the book "wooden," yet there is no available adjective that so nearly sums up the impression that Mr. McCarthy's novels leave. He brings young people into his books who fall in love with one another, and he introduces all the "local color" which he has at his command. He writes easily, and turns neat paragraphs with a little quotation from Uhland, or Tibullus, or the last French novel with perfect ease, and still the story never rises above an arid level. The puppets are all dressed in the newest fashion; the play of the "Danicheffs" is mentioned, bringing the events described down to the very latest times, but these factitious aids breathe no life into the unreal beings whose loves are here recorded. There is one chapter, describing an election riot, which is comparatively life-like, but the rest of the story, which is without any imagination and is put together by careful invention and with painful literalness, seems more unreal than a fairy-tale.

'The World Well Lost' is not exactly pleasant reading. Its author, Mrs. E. Lynn Linton, has already in other books shown her dislike of English society, but in this novel it takes the form of almost violent abuse, and although the incidents she describes doubtless find frequent confirmation in fact, the impression the reader receives is rather of the writer's virulence than of her careful study of mankind. There is a worldly mother whose worldliness, in the lack of other human qualities, becomes monotonous; there are young girls who are not wholly worldly,

* 'The Story of Avis. By Elizabeth Stuart Phelps, author of 'The Gates Ajar.'' Boston: James R. Osgood & Co. 1877.

'Miss Misanthrope: A Novel. By Justin McCarthy, author of 'A Fair Saxon,' 'Lady Judith,' 'Linley Rochford,' etc., etc.' New York: Sheldon & Company. 1877.

'The World Well Lost: A Novel. By Mrs. E. Lynn Linton, author of 'The Atonement of Leam Dundas,' 'Patricia Kemball,' etc. With illustrations.' Philadelphia: J. B. Lippincott & Co. 1878.

and there is indeed a young man who is courageous enough to marry the penniless daughter of not over-reputable parents; but it is much more Mrs. Linton's disdain for English matrons and their victims that the story illustrates than the power of sincerity and simplicity. It tells of a lady who makes her appearance in an English county with an attractive son and daughter, who both fall in love with young neighbors. The father of the family is away, and from the first it is an easily-guessed secret that he is in prison. The discovery of this disgrace, after he has served out his sentence and returned home, complicates what plenty of love-making has already made, a confused state of affairs, and nearly breaks a number of young hearts. In one of the cases, however, fidelity wins the day, and the young couple start off to the convenient colonies to begin life there; for in parts of Australia a previous condition of servitude is possibly not considered to entail disgrace. The revolt of these people against social laws by no means undoes the impression of general worthlessness and corruption that the book leaves on the reader's mind, and it is hard to avoid feeling that Mrs. Linton's pen has been more venomous than was actually necessary. Her asperity resembles the spite of a clever woman more than it does righteous indignation against great wrong. In point of literary skill Mrs. Linton overtops most of the writers of the ordinary run of novels, but it may be questioned whether this sort of composition gives her the best opportunity to express what she has to say. Her cleverness, however, often inspires her with inventions that duller novelists struggle for in vain.

Merely to call '"Cherry Ripe"' one of the poorest of recent novels by no means does justice to the exceptional qualities that have contributed to the composition of this extraordinary book. It gets its name from what the author calls "the old talismanic song," which rises to the heroine's lips at almost every important crisis of her eventful life. It would be hard to contradict the assertion that this young woman was absolutely feeble-minded. Her words and deeds were probably meant for the tokens of tender innocence, but they are absolutely incredible. The reader is kept in a state of indignation or guilty enjoyment over some enormous scandal, which proves in the end to be nothing—after the fashion of some old French stories, in which the interludes are enlivened by merry riddles that shock the hardiest reader, but are all in turn shown to be free from any taint of offence. Adam Montrose marries suddenly the heroine, who appears to be in love with a dashing *roué*, and when she finally elopes with him the husband's indignation seems only too well founded. He determines never to see her again, and tries to forget her; but it is only by her appearance in his rooms at the same time with her supposed lover that the truth becomes known. She has, meanwhile, gone mad, and the vicious lover is at the point of death; but before he breathes his last he manages to set matters straight. The precise complication that he unravels need not be stated here, but the reader can rest assured that for the small sum of fifty cents he will get a large and varied assortment of silly talk, vicious love-making, and second-rate fashionable gossip of the disreputable sort. As to the style in which the book is written, it can be made clear by a single short quotation. It is thus, for instance, that the Parisians are described in an outburst of eloquence concerning Paris:

"And so it is that her children, though oftentimes in their mad and senseless fury they turn upon and rend the bosom that warmed and nourished them, yet love her with a deep and exceeding love that is stronger than the love of wife and home and children; that she is the idol of their youth, maturity, and old age; and that she is the very core of their heart; so do they die with her name upon their lips."

'Erema; or, My Father's Sin,' is a very different sort of novel. It contains a most ingenious plot concerning a young girl who, before she is twenty-one years old, baffles some most accomplished villains and clears her dead father's name from the suspicion of murder. The reader's interest in the heroine carries him through the languid pages in which Mr. Blackmore leisurely narrates the obstacles that stood in her path, and the means she took to get round them. Most of the light that is thrown on the mystery comes from people who are particularly long-winded in saying their say, so that it is a tolerably sandy road that the reader has to plod along. It is also a devious one. The scene changes from the Rocky Mountains to various parts of England, and back again to this country, and there is a great multitude of persons introduced; but it is neither Mr. Blackmore's style, much as that has been praised, nor yet the variety of characters, that will secure the reader's attention. The plot alone does that.

Mr. William Black has also honored this country by making it the scene of a good part of his last novel, 'Green Pastures and Piccadilly.' He can hardly be said, however, to have improved the novel by this device, for although he called to his aid an American writer who seems to have been familiar with the time-table of the trains running between this city and San Francisco, it can hardly be denied that the part of the book which treats of this country is not much more than a hasty record of a hasty journey. To be sure there is a certain amount of conversation thrown in, but the change from the regular course of an interesting novel to the cursory description of a trip to the West is violent and disappointing. If it had not been for this interruption the book would have deserved nothing but praise. It begins well with its account of the love and subsequent misunderstanding of the hard-headed young member of Parliament and daughter of the disreputable nobleman, and the reader will probably find it pleasant to meet again his old friends out of 'The Strange Adventures of a Phaëton,' now of somewhat riper years. But on the whole the book is disappointing. Mr. Black has not strengthened himself by joining hands with a new man, to whom probably is due the full credit for this sentence: "The women would not hear of this proposal in its entirety," which is to be found on p. 301, at the end of chapter xii.

In 'Hector Servadac' M. Jules Verne is even wilder than usual. No reader cares for a miracle or two more or less in this author's pseudo-scientific jugglery, so long as he is interested in the generally pretty thrilling plot, although there are parents and guardians who zealously keep their sons and wards from looking at Verne's enticing volumes. Perhaps they are right; but the present story could not deceive a babe in arms, and is amusing enough to disarm any one's wrath. A comet, it is stated, comes into collision with the earth, and chips off a bit of the south-western Mediterranean with some of the adjacent shores. A few men survive this accident, and are whirled through space on this comet, which fortunately carries with it a satisfactory supply of atmospheric air. A volcano supplies these travellers with heat, while a professor who goes along with them gives the reader instruction in astronomy, physics, etc., which probably would not be satisfactory to most watchers in observatories. After all, it is probably the melodramatic side of Jules Verne's writing that does harm.

M. Léon Cahun is a writer who seeks distinction in the same field with his better-known countryman. But, although he writes books full of incident and adventure, there are plenty of people who go bail for his accuracy and even for his erudition, and the reader of this book at least, 'The Blue Banner,' gets the impression that it is pretty solid meat that is offered him. The story describes the adventures of a follower of Jinghis Khan, and, as was only to be expected, it is crammed with accounts of bloody fights. This will commend it to the young reader, and the pains that have been taken to secure accuracy will disarm the objections of their elders. Those who care for the subtleties of the modern novel will probably not be attracted by the tumultuous head-breaking and profuse slaughter of this one. It may be our fault that the story seems to us rather confused, but what is to be expected of an account of Jinghis Khan?

If any one who has taken up 'Grey Abbey' has read that novel with delight, let him at once go to the nearest bookseller's and buy 'Harry Holbrooke'; the course to be pursued by those who have been pleased by 'Harry Holbrooke' is obvious. These two stories are as like as possible. They have both been written by men who are fond of horses, fishing, shooting, etc., and they contain a gossiping account of the good and bad deeds of English people. The author of 'Grey Abbey' gives us no mere crumbs of gossip that have fallen from the tables of the great and good, as is sometimes done by ignobler writers; he serves up huge lumps of entertainment in the shape of elopements, smuggling, and various kinds of villany, which are all narrated in a good-natured, amusing fashion, and Sir Randal Roberts follows in just the same track. What the book shows more conclusively than anything else is the extreme

prevalence among Englishmen of the habit of novel-writing. Americans who write novels form a small class who live apart from the rest of the world and devote themselves especially to literature, but here are two books which are as unliterary as sign-painting is unartistic, that owe their existence to the general greed for fiction.

'Doubleday's Children' is a novel that would have been much better if it could have been divided into half-a-dozen separate volumes. As it stands now, the story strays somewhat uncertainly from the fate of one child to that of another, so that confusion is the result; and an amusing, old-fashioned novel, written with considerable humor, fails to leave the most satisfactory impression upon the reader. Doubleday himself was a sort of Micawber who died in a debtor's prison, leaving his children to make their way in the world as best they could. Their experiences are crowded incongruously together and make a thick, incoherent book, of a kind that was more common a few years ago than it is now. Still, there is a good deal of entertainment to be got from it by those whose tastes are not wholly enslaved by the most recent records of violent flirtations.

'Souci,' on the other hand, is a novel of the modern school filled with rapturous passion and high-strung romance, and colored by a good deal of what is called "word-painting." There is hardly a character in the book who is not the victim of some tremendous emotion, and often of two or three at the same time, so that the reader is kept for ever on the rack of uncertainty as to whether the straying lovers, who are for the most part wonderful hands at singing and playing the violin, are going to meet. It is, perhaps, fair to say that the story reads something like the work of a chastened "Ouida"—in other words, of a writer who prefers to write about great geniuses, but with moderation unknown to the more famous writer.

'Mignon' tells how Sir Tristram Bergholt, aged forty-six but sound in wind and limb, fell in love with the youthful Mignon, and, by means of promising to help her brother, married her. She cares nothing for him, however, and flirts in a way that would fill Miss Irene MacGillicuddy's soul with horror. The young minx is as hard and unloving a creature as can be found in fiction until her beauty is destroyed by a painful accident. She takes this occasion to reform—her lover fleeing from her after this—and when her good looks are marvellously restored she persists in avoiding mischief. The whole book is decidedly rowdyish in tone, but it contains some not bad sketches of fast society. It belongs to a set of novels that have one stereotyped form of character, plot, and incident; and it is not a form that deserves praise, but it is sure to find favor with a class of people who will overlook loudness of tone in a book if they can only find description of flirtation and amusing conversation.

It may safely be assumed that the author of 'Behind the Arras' is a young writer. A practised littérateur does not lavish two mysterious strangers, two disappearances, a murder and a trial on one plot. The writer is as evidently an American, who for reasons sufficient to her own mind selects her characters and lays her scene in England among people of rank and fortune. It is, however, given to few of us to construct giraffes out of the depths of our moral consciousness, and it is manifest that Miss Neville has not seen the society she describes. We believe it was Sir Walter Scott who, while he was writing 'Rokeby,' went to the scene of his poem that he might examine most carefully the external aspect of the place, its rocks, trees, foliage, wild-flowers, and all those things which in Scotland he knew by heart, not trusting to his general knowledge of the country to secure him from anachronisms. For lack of such care the first description of English scenery in this book fails in verisimilitude, and the same defect disables the accounts of habits and manners. Young English ladies of wealth and title rarely "tidy" their rooms or make their own beds; they have not the habit of steady sewing or of making their own dresses, and girls of seventeen do not lead the conversation at their father's table. It is common in America—not among the English peerage—that children should be "adopted" and brought up in families not their own, yet Miss Neville's heroine and one of her minor personages are in that position. Altogether it is an unreal work to which we are introduced, and the characters are "such stuff as dreams are made of." This is inevitable under the circumstances, and we invite Miss Neville, in future writings, to use her facility in testifying of that which she has seen. If she will go deep enough into the sub-soil of human life and human nature she will find abundant springs of interest; whereas, though cleverness is shown, this book is mere drift.

It really would be simpler for critics, and no doubt equally instructive to their readers, if novels were classed and numbered, with due description of each category—as, for instance, we should simply say of a certain book: "This is a No. 1 novel," and, turning to his list of references, the reader would find "No. 1—an old-fashioned love-story," and, running his eye along, would see "No. 2—unnatural view of life and events, supposed to be adapted for Sunday-schools and serious readers"; "No. 3—originality and freedom of thought the intention; vulgarity and slang the result"; or, "No. 4—discussion of moral and social problems, without reference to facts of any kind." This simple plan not being yet in general use, we are obliged to say that 'An American Girl and her Four Years in a Boys' College' describes the triumphs of a young lady who has beauty, wonderful health and strength, and noble faculties, so that she makes her way unimpeded (the slight disagreeablenesses which she encounters are hardly impediments) through all hindrances of creed and custom, and obtains a distinguished position in "one of our best colleges." She skates, shoots, rescues young men from drowning, chops wood for exercise, refuses hapless young tutors who fall victims to her charms, is struck by lightning and consequently engaged to be married. Her lover proves a weak worldling, who would prefer that her gowns and her hair should be longer, misbehaves, and she frees herself from him and enters a medical school. There are some peculiarities of expression about the book, as where the American girl's eyes are described as "blue in the skylight and gray in the shadow"; and it may be briefly ranked as a No. 4.

Prose and Verse: Humorous, satirical, and sentimental. By Thomas Moore. With Notes edited by Richard Herne Shepherd, and a Preface by Richard Henry Stoddard. (New York: Scribner, Armstrong & Co. 1877.)—Time's revenge upon an author may be regarded as complete when his poorest things are reprinted to punish him for having written good ones. Two editors have done their best for Moore's "uncollected writings," but they have, after all, brought forward no good reason for the collection. The verse in this book is of the poorest—the very lees of wit and fancy; while the prose consists largely, as Shelley said of Southey's conversation, of "long extracts from forgotten writers on unimportant subjects." There is scarcely a man now living who can take an honest interest in the claims of Lord Thurlow as a poet, or of Madame de Souza as a novelist; and though the Greek Fathers are intrinsically more interesting, the dapper little Irish poet treats them as if they were not. Mr. Stoddard, indeed, musters courage to pronounce this contribution "excellent"; but though we regret to differ from that gentleman in a matter of theological literature, we should call it a trivial and valueless essay. Poorer than any of the reviews, even, is the comedy of "M. P.; or, The Blue-Stocking"; and the reader's respect for Moore revives a little on being told (p. vii.) that he himself called this play "contemptible." The only part of the book that deserves printing or reading is comprised in the last thirty pages, containing "Notes for Life of Lord Byron, printed from the original MS." These notes are of much interest; they were deciphered with great difficulty, it is stated, from a quarto manuscript book of Moore's; and every student of Byron will be glad that they are preserved. Could these few pages have constituted the whole book, its value would have been more than doubled; for, as it is, many readers will fall asleep by the way, and never reach them.

The Nation.

NEW YORK, THURSDAY, MARCH 28, 1878.

The Week.

WE have discussed elsewhere Secretary Sherman's conversation with the Senate Committee, without, however, going over his statements *seriatim*. One of them, on which we have not touched, is remarkable for the illustration it affords of the facility and rapidity with which the Secretary can reconcile himself to even gross violations of the national faith. The statute of February 25, 1862, creating the Sinking Fund, which has never been repealed, provides that "all duties on imported goods shall be paid in coin [or in demand notes, no longer in existence], . . . and the coin so paid shall be set apart as a special fund, and shall be applied as follows: first to the payment in coin of the interest on the bonds and notes of the United States, and, second, to the purchase or payment of one per cent. of the entire debt of the United States, etc." This act has constituted a pledge of the most solemn kind to all creditors of the United States on loans contracted since that date. Nevertheless, when asked at the late interview what Congress could do to aid resumption, he calmly said that "he would recommend one thing—that on the first of October next he should be allowed to receive notes for duties." It ought to be said that he thinks the notes will be then at par in gold; but he has no right to ask the public creditor to accept the prophecy of an individual in lieu of a national pledge. Too much financial legislation has been already based on prophecy.

The correspondence between Sir Edward Thornton and Mr. Fish about the appointment of the umpire in the Fisheries Commission shows beyond question that M. Delfosse was mentioned by Lord Ripon at Washington, during the negotiation of the Treaty, as a person to whom the United States would probably, and justifiably, object on account of the peculiar political relations existing between Great Britain and Belgium; that this objection was made and adhered to by Mr. Fish during the three months within which it was open to the two parties to agree on the third arbitrator, and the names of six other foreign ministers accredited to Washington were suggested by him and rejected by Lord Granville, who did urge M. Delfosse; that finally, through non-agreement, the choice fell to Count Beust, the Austrian Minister at London, who appointed M. Delfosse, and then no further objection was made by the United States. If it was believed, however, that M. Delfosse was so disqualified as to be unlikely to make a fair decision, his appointment ought to have been then protested against, and the litigation ought not to have been entered on before him. No such protest was, however, made, and the case was submitted to him. There can, therefore, be but one valid excuse now for disputing his judgment, or refusing to abide by it, and that is the belief that he decided corruptly. No such charge is made; in fact, those who propose to disregard his verdict at the same time express high respect for his character, so that the meaning of the discontent is really that we do not like to pay so much money, and this is what ought to be said frankly.

It was shown very conclusively in the debate in the Senate last week that the Senators who were attacking Mr. Schurz about the timber depredations neither knew what the law was nor what the practice of the Department in times past had been. In fact, they were overthrown at every point. Secretary Schurz has been executing the law, and they did not like it, but did not know what ailed them, and thought their suffering was caused, not by their having thieves as their protégés, but by his having been born in Prussia. They have now endeavored to apply a remedy, by enacting, not that the Secretary of the Interior must be a native American, but that the appropriation for the prosecution of timber-thefts shall be so small that no such proceedings can take place; and they also provide that the cutting of Government timber shall not be unlawful unless for export from the Territory in which it occurs; and this intent to export is, of course, in the region where these depredations are committed, almost incapable of proof. So that in one way or another they have paralyzed the efforts of the Department to protect public property, and this through low demagogy and blind hatred of the Administration; and they evidently think the people of the United States like or admire tactics of this sort.

The public will recognize, apropos of the above, an old and now familiar friend in this "story" of the Washington correspondent of the *Tribune*—that Senator Howe was about to make "some very severe attacks on the Southern policy of the Administration; that this speech is to be followed by others in the same strain, and that, in order to prevent the Republican party in Congress from placing itself in open antagonism to the Administration, the President will, in deference to what is believed to be the general sentiment, call to his Cabinet some representative of the more radical wing of the party. To do this it would, of course, be necessary to ask the resignation of one of his present Cabinet Ministers." We are able to add to this interesting narrative something that we found out ourselves by merely guessing—and that is, that the Cabinet Minister whose resignation will be asked in the contingency aforesaid is a man named Schurz, German by birth, and justly obnoxious to innumerable "active and intelligent" rascals. This story is not, however, as valuable as it seems at first sight, and the correspondent judiciously calls it "sensational." We believe that the President was fully prepared for Senator Howe's speech, as well as for those that are "to follow," and all their horrible consequences. He is a pious man, and feels that he is in the hands of Providence, and, like Mr. Evarts, who when solemnly warned by an officious friend against using coffee after drinking Saratoga water, on the ground that it would "precipitate the salts," declared that "he liked to have his salts precipitated," would apparently rather enjoy seeing "the Republican party in Congress placing itself in open antagonism to the Administration."

The attack by Senator Howe came in due course on Monday. It was three hours long, and was carefully written out, and was in the main a very dull history of the Republican party, seasoned with denunciation of the President's policy, of the South, and of Secretary Schurz. By far the greater part would not repay the reading, much less the criticism, of anybody engaged in an honest calling. For the errors of the President's policy, if errors there are, he offered no remedy whatever. For the improvement of the condition of the South, as Mr. Howe describes it, he suggested a course of hate and annoyance on the part of the North, but then acknowledged ruefully that as the Democrats were coming into power there would be no chance of pursuing any such course. The attack on Mr. Schurz was very personal and bitter and carefully prepared. It would, of course, never have been delivered if Mr. Schurz had been in the Senate and able to reply to it. The *Tribune* says the assault will "attract attention," which is quite true—its own attacks on Mr. Schurz have attracted "attention"; but the question is, Whom does "the attention" most damage?

The Senate's achievements during the week have been the passage of a bill to encourage tree-planting on Government lands, and the passage, three days afterwards, of the so-called Little Deficiency Bill, ingeniously contrived to perpetuate the present wholesale destruction of timber. The net result of the week's work is therefore almost invisible. The House has passed a useful bill to reform the advertising of mail contracts, and the Naval Appropriation Bill,

whose specifications are minute beyond precedent, and therefore well calculated to prevent abuses in the expenditure, by one department, of moneys intended for another, and in other ways. Finally, the House refused on Monday the necessary two-thirds to three efforts to commit it to an extension of its financial meddling on behalf of silver, an irredeemable currency, and inflation. Mr. Springer's motion was to suspend the rules in order to fix a day for the consideration of his bill authorizing the coinage of gold and silver on the same terms, and the issue of certificates alike on gold and silver deposits in the Treasury. This failed by 140 yeas to 102 nays. Mr. Goode moved to suspend the rules in order to pass the bill suspending the operation of the Sinking Fund Act for five years; lost by 123 yeas to 112 nays. Mr. Durham moved to suspend the rules in order to fix a day for the consideration of Mr. Stephens's bill to secure bullion certificates for silver; lost by 142 yeas to 96 nays. The Tariff Bill was reported to the House on Tuesday, and by an almost party vote was assigned to the Committee of the Whole for April 4; yeas, 137; nays, 114, of whom only 13 were Democrats. The "free-ships" section has been struck out.

The judgment of the Louisiana Supreme Court in Anderson's case calls attention in very proper and dignified language to the fact that an open letter of certain "visiting statesmen," including Mr. John Sherman, Mr. Stanley Mathews, and others, addressed to the prisoner, had been printed and spread before the court in his counsel's brief, "in which the public and the people from whom the jurors were to be drawn were informed that he was falsely accused and maliciously persecuted." The court then went on to say that a somewhat similar incident occurred in England during the Tichborne case, which produced such extraordinary excitement, both in political and social life, that during the trial Mr. Onslow, a member of Parliament, wrote a letter saying the claimant was falsely accused and maliciously persecuted, whereupon the Lord Chief-Justice had him (Onslow) arrested, fined him $1,200, and sent him to the county jail in default of payment, and the House of Commons, though then in session, sanctioned the punishment. The court leaves the application of the story to the public, and we must say that if it could have got at a "visiting statesman" and locked him up for a short period, it would have done service to the administration of justice and helped in the purification of public morals.

Another report of the South Carolina Fraud Committee has been made, containing more testimony seriously involving the reputation of Mr. D. H. Chamberlain. A ring was formed in 1870, the committee report, to get control of the Greenville & Columbia Railroad, a corporation the stock of which was mostly owned by the State. The "ground-floor" of this venture was divided into twelve shares of $20,000 each, of which Senator Patterson took one; Niles G. Parker, State Treasurer, one; George W. Waterman, representing Governor Scott, two; Reuben Tomlinson, State Auditor, one-half of one; Kimpton, the financial agent, two; Cardozo, Secretary of State, one-half of one; Neagle, Comptroller-General, one and a half; and Chamberlain, Attorney-General, one-half of one. Parker swears that, according to his understanding of the matter, Chamberlain's share was paid for by Kimpton; and that Kimpton would be selected as Chamberlain's go-between is antecedently probable, as it was on Chamberlain's recommendation that Kimpton, who was his classmate, but an unknown and penniless adventurer, was made financial agent of the State, without being obliged to give any security save his own bond. This Ring, it will be observed, consisted of all the chief officers of the State. On its formation measures were at once taken to secure legislation authorizing the sale of the State stock in the railroads, and for this purpose an act was passed creating a commission, composed of Scott, Chamberlain, Neagle, the Chairman of the House Committee of Ways and Means, and the Chairman of the Finance Committee of the Senate, to sell all the "unproductive property" of the State. Ostensibly, the object of the bill was to dispose of a quantity of damaged granite and marble; but the commission at once turned its attention to quite another quarter, and sold 21,698 shares of stock in the Greenville & Columbia Railroad (which cost the State $433,960) for $59,669 50. The committee say that this was followed by a sacrifice of the interest of the State in all the other railroads in which it was interested, and the accumulation of a fund which was transferred to the financial agent and lost by "hypothecation" and "general bond-swindling." The stock was sold without advertisement, and without even the formality of an authorization by the commission, or any limitation as to price. The act, it is needless to add, was passed by bribery.

The stock having thus been acquired, more legislation for the purpose of selling bonds was needed, and another bill, drawn up by Chamberlain, was introduced on February 17, 1871. By the existing laws the State had a first lien for her endorsement of the bonds of the company, which made subsequent bonds of little value. A section of Chamberlain's bill therefore provided that the State's lien should be changed from a first to a second mortgage, thus enabling the Ring to float their own bonds, and to saddle the State with the liability for them. It appears further that the Ring did not, by any means, "put up" the $240,000 required as the basis of this operation in money of their own, but that this was obtained, at any rate in great part, by Kimpton's sales of State bonds. The money for Chamberlain's share appears to have been obtained in this way; according to Parker's testimony the understanding was that "the amount of these expenditures and many others should be realized from State bonds, and covered by the difference between the actual amounts for which the bonds were sold by Kimpton, and the amount which he should report that he had sold them for." It will be remembered that Chamberlain, when first accused of complicity with the Ring, had a great deal to say about the "Finance Board" and the "Financial Agent." The Board consisted simply of three members of the Ring, and the agent's operations are tersely described by the committee as follows: He sold over $8,000,000 of bonds, and "for nine-tenths of this enormous amount there is no mention even of the rates of sales"; $2,843,000 bonds are reported by him as all sold on one day, and $4,214,500 on another. Some of the testimony appended to the report is very amusing. Kimpton in one of his letters to Parker urges him to hurry up the "collection of taxes," so as to stop a panic in the bonds on the New York market, which he is afraid will exhaust his "collaterals" if it is not stopped. Moses, who was Speaker of the House, made a very handsome profit out of the Ring's railroad legislation, first selling the appointment of the committees for $25,000, and then stopping the passage of one of the Ring's bills by "recognizing" two reformers, who were fighting the bill tooth and nail by making dilatory motions, until he secured $10,000 more; after which the two reformers found that, for some reason or other, the Speaker's attention could not be got. The South Carolina House of Representatives has passed a concurrent resolution authorizing the Governor to have any of the Ring prosecutions *not prossed* at his discretion; the object being, of course, to get some of the lesser rogues to turn State's evidence.

Both branches of the Iowa Legislature have passed an act repealing the Granger legislation of that State fixing freight charges. The legislation has, of course, aroused great hostility, and proved impracticable in operation. Probably in a few years all the Granger acts will be swept off the statute-books of the Western States, and no trace will be left of the great Granger movement save the reports of some very extraordinary decisions by the courts made under the influence of the excitement, which will gradually be "qualified" and "distinguished" by new judges in such a way as to deprive them of the baleful effect which seemed at one time to be their necessary consequences. Probably a few years hence it will hardly be believed that, under the influence of the Granger craze, courts of last resort decided that laws fixing the price to be paid by merchants for a particular kind of service rendered by private individuals were constitutional, even though they affected the value of securities issued under

a tacit agreement with the State that the basis of their value should be those very services; just as it will probably require an effort to realize the fact that, in the present year of grace, the same community which devised these laws also invented the theory that the power to coin money included the right to debase the coinage.

The Attorney-General of this State has, in response to a resolution of the Assembly, given an opinion with regard to the constitutionality of the Board of Estimate and Apportionment, which fixes the annual city budget. This Board consists of the Mayor, the President of the Board of Aldermen, the Comptroller, and the President of the Department of Taxes and Assessments, and, under the present charter, it makes annually, by a vote required to be unanimous, a "provisional estimate" of the expenses of the city government for the ensuing year, which is then submitted to the Aldermen for their consideration; but, inasmuch as the Board have the power of overruling any objection made by the Aldermen, and as their action is final, and the estimates as passed by them become, without any further action, the budget for the year, and must be passed by the Aldermen, no objections of the latter are of much avail. The Attorney-General says that this is all constitutional, as being only a "restriction" upon the taxing power of the city, and that the Board of Estimate and Apportionment is not actually vested with the power of taxation. But, practically, of course, a Board which "restricts" the taxing power in this way has all the taxing power that any body has, and the object of the statute creating the Board is, as every one knows, to prevent the Aldermen from taxing us.

The whole question will shortly come before the courts, so we express no opinion on its legal aspects. But the matter has a practical bearing of great importance. The creation of what the *World* calls this "Council of Four," with only two elective members, and only one representing the legislative body of the municipal corporation, is merely the final step in a long series which have gradually vested the powers originally enjoyed by the corporation in a number of executive boards removed as far as possible from the popular constituency, which is allowed to go on year after year electing a simulacrum of a city legislature without character or power. To try to revivify this simulacrum and make it a real government, with two houses having general legislative powers, would be as ridiculous as to go back to town-pumps and volunteer firemen. To those who have supported the Constitutional Amendments (which merely altered the method of selecting the Board of Estimate and Apportionment by putting it in the hands of the tax-payers) there is something very amusing in seeing the Kelly Democrats, headed by the Boss's new Attorney-General, engaged in an active defence of a Board which has absolute authority over the taxes, and which exists for the express purpose of preventing universal suffrage from having its usual effect on the local tax-levy; or, in other words, of "robbing the poor man" of the legitimate influence of "his vote."

The importations of U. S. bonds from Europe continue in sufficient volume to take up all the bills made against the enormous exports of domestic products, and to maintain the rates for bills on London just a little below the point at which gold coin can be profitably exported. The nominal rates, 4.89½ for demand bills and 4.87½ for 60-day, are at the shipping point, but though they were reached early in the week the actual rates are yet ¼ of a cent below. There seems to be but one opinion as to specie exports, and that is that they will begin very soon, and will be continued, perhaps with interruptions, until the gold in the market (now about $40,000,000) is exported. Some bankers think that this will occur before September, while others think that not more than $25,000,000 will have been shipped by that time. The purchase in London of silver for coinage into 412½-grain dollars has not advanced the price there; it closed at 54½*d.* to 54¼*d.* per oz. The market here has been strong, however, and closed at a price that makes the bullion in one of these dollars worth about 92½ cents gold.

The Paris *Temps*, one of the soberest and most influential of the French papers, remarks on our Silver Law: "There is in the second section a singular economical error. The American legislator believes it to be possible to fix by law, without regard to market price, the relative value of gold and silver, and with this view he asks the Latin Union for a concurrence and agreement, which he cannot get." The foolish "gold-bug" evidently had not heard "the noise of the captains and the shouting" in Cincinnati and Chicago. Why, millions in the Mississippi valley say that this relative value can be fixed, and millions more say it makes no difference whether it can or not. Does a good loud yell count for nothing in a matter of this kind?

It is impossible to extract any new certainty from the jumble of conflicting reports about the negotiations for the European Congress. Appearances, however, all point to a strong determination on the part of Russia to prevent an Anglo-Austrian alliance, cost what it may in concessions to Austria. That this policy is telling on Austria, too, seems very probable; and it also seems probable that Bismarck is chuckling over the way the thing is working, and is surer than ever that all will "come out right in the end." There is perfect confidence in Russia that England without Austria is not a formidable antagonist to a power in Russia's present position, and the perception of this seems to be growing in England. The feeling in Russia, too, against England is becoming very bitter and defiant, which is quite natural, whether the Russian policy be honest or knavish. Lord Derby has made a somewhat despondent speech in Parliament about the Congress, and there is an uncomfortable suspicion out of doors that the Ministry is at the end of its resources, and that Lord Beaconsfield has, after all, no great *coup* in store. It would not be at all surprising now if the warlike preparations ended in a refusal by England to take part in the Congress, and the holding of it by the three Emperors, and the settlement of the Eastern question by them on a basis to be submitted to England afterwards for her approval, and which she will accept sulkily if it leaves the Dardanelles open, and so the whole cloud will blow over. The chances of war, in spite of the military preparations, seem to diminish every day. The great obstacle to it is that it could have no definite object, considered attainable by any rational man. The time to have gone to war was before Plevna fell.

Bismarck is having a good deal of trouble in the internal affairs of the Empire, which probably in some degree distracts his attention from the Eastern question. He has long been annoyed by the covert hostility of the Prussian officials to the Imperial Administration of which he is the head, and some increase of control over them has been rendered all the more necessary because the Empire is not yet wholly independent of the individual states in the matter of finance. Its direct revenue levied by itself is derived from the customs, the telegraph, and the post-office; if its receipts from these sources are not sufficient, it has to rely on votes of the states legislatures to meet the deficiency; so that to get control of the situation he had a bill introduced in the Federal Council allowing him to appoint substitutes for himself in the various departments of the Empire, and these substitutes, it was understood, were to be the corresponding members of the Prussian Cabinet, who would in this way be brought under his direct orders. At the same time he proposed, by way of increasing the revenue, to increase the tax on tobacco, and to win over the Liberals to these changes by giving places in the Ministry to several leading members of the party. The scheme has broken down, however, owing to the refusal of the Liberals to make any change, unless the Government surrenders both in the Prussian and German Parliaments its present right to the permanency of every tax once voted; that is, under the present usage every tax is voted for all coming time, and the only power the legislature possesses over it is to increase it. The Liberals ask that hereafter taxes shall, as in England and America and France, be voted for only one year; but this would so seriously diminish the power of the Crown, particularly in military matters, that it is not likely to accede to it without a severe struggle.

SECRETARY SHERMAN ON RESUMPTION.

WE presume nobody who is acquainted with Secretary Sherman's career as a financier, supposed for one moment that his adaptation of himself and his policy to a new situation would be a pleasing spectacle for a moralist. We shall, therefore, not take the trouble to point out his inconsistencies in the remarkable conversation held by him with the Committee of the Senate on Tuesday, the 19th. We shall discuss his statements as if they were a financial programme emanating from a gentleman who has never been heard of until now—that is, on their merits solely, and without any reference to those of their author—and if we seem over-censorious in judging what many will consider a well-meaning attempt to solve a very difficult problem, our excuse is that, if there be one thing in the world about which self-deception or word-painting is dangerous, it is finance; if there be one thing about which it is not permissible to delude one's self or to shirk unpleasant facts, it is about the mode of meeting pecuniary obligations.

The Secretary was asked his opinion as to the effect of the Silver Law on resumption. He said it was in part favorable, in part unfavorable. He described the unfavorable effects first. It had stopped the sale of the four-per-cent. bonds, he said; it had stopped the accumulation of coin in the Treasury, and it had caused heavy returns of our bonds from Europe. These are simple statements of facts, and he was quite clear about them. Their meaning is obvious. The sale of the four-per-cent. bonds has stopped because such a shock has been given to the national credit that we have ceased to be a four-per-cent. nation—or, in other words, people will no longer lend to us at that rate of interest. Our bonds are coming back from Europe because large numbers of the holders doubt whether we shall long maintain our position as a six-per-cent. nation. They fear that the Silver Law will be followed by other laws of a still more mischievous character, and think, therefore, to use the language of the London *Times*, "that if the Americans are to try experiments on their credit, they had much better do so with the debt held at home than in English hands."

The immediate effect of this on the resumption problem is this: that the Europeans, in so far as they send bonds here for sale, pay for our products in bonds instead of gold, and may, by so doing, should our exports diminish at all, compel us to pay gold out instead of receiving it. In fact, they have very nearly brought us to that point already. Thus far there is a tolerably good market for the bonds here, owing to the badness of other investments and the abundance of money lying idle through the general want of confidence in the future. The existence of this market led the "Sycamore of the Wabash" to interject the remark that "capital seeks our bonds when this bi-metallic basis is declared"; but then the Sycamore's observations on financial questions, although he was one of the leaders of the silver movement, only call for Charles Lamb's reply to a person of similar calibre—that is, an examination of his bumps with a lighted candle. The unfavorable effects, then, of the Silver Law are that it has seriously injured our credit while we are still heavily in debt, and threatens to diminish our stock of gold on which we are relying for resumption, and cause the withdrawal of large bodies of capital which would otherwise be available for our domestic enterprises, by the sale of our securities by foreign bondholders. Financially speaking, it would be hard for the effect of anything to be more unfavorable.

The favorable effects of the Silver Law are, according to Mr. Sherman, first, that it has "satisfied a strong public demand for bi-metallic money, and, in a Government like ours, it is always good to obey the popular current." This would be a good enough remark coming from a politician who is getting ready for the fall election; but a financier cannot say that it is well to satisfy a popular demand for bi-metallic money by anything but two metals in circulation. A *promise* of bi-metallic circulation is not honest satisfaction, and an honest financier ought not to talk of it as such unless he believes that it will be fulfilled. That Mr. Sherman believes this is hardly possible. He knows, we venture to assert, that as silver coin grows abundant, unless the price of silver bullion rises nine per cent., gold coin will disappear. If he believes that any such rise will take place in silver, he ought to have said so, and we have no doubt that had he believed it he would have said so. As matters stand, passing the Silver Law to satisfy "a popular demand for a bi-metallic currency" is very like Micawber's plan of settling a debt by giving a note.

Secondly, he says "resumption can be more readily maintained upon a double standard than on a single standard." This means, we presume (it cannot mean anything else), that it will be easier to redeem United States notes in gold *or* silver than in gold alone. This is true, in case gold and silver are at par; but if they are at par, it does not make any difference whether we have a double standard or not. If one can be had in the market at the same price as the other, it does not make any difference to a debtor whether both are a legal tender or only one, because with one he can buy an equivalent amount of the other. If they are not at par, Mr. Sherman will not resume or maintain resumption on a double standard; he will resume and maintain resumption on a single standard, composed of the cheaper metal of the two. So that his prospects as a resumer do not depend on the silver legislation, but on the market price of bullion. If by January 1, 1879, silver is as good as gold, he can resume on which he pleases; if silver is not as good as gold, he can only resume and maintain resumption in silver, because his gold will leave him for exportation. So that if he had given the Committee his views as to the course of the silver market, he would have gone to the core of the whole matter; but this he did not do.

The most important thing in the conversation was, however, the Secretary's entirely new definition of resumption; and to this we must ask the serious attention of our readers, for it is probably the most singular phenomenon of the present financial crisis. Resumption, as it has been understood, we venture to assert without fear of contradiction, ever since the close of the war has meant, in the eyes of all friends of honest government and sound currency, the redemption in coin of the promissory notes called greenbacks, issued and made legal tender by the Government to meet its necessities during the Rebellion. The evils, both public and private, of the existence of these notes have been fully demonstrated, and the object of the Resumption Act was to call them in and destroy them, and take the Government once for all out of the position both of an insolvent debtor and of an issuer of paper money. The resumption problem, therefore, as it has presented itself to the minds of those who have supported and fought for that Act, is to accumulate, and keep on hand in the Treasury, coin—we care not whether gold or silver—in sufficient quantity after Jan. 1, 1879, to pay the Government notes as they are from time to time presented, until they are all withdrawn and cancelled, and the Government is thus relegated to its old Constitutional function of issuing gold and silver coin, and this only, for currency. Mr. Sherman has maintained all along that he would be able to do this work of redemption in gold coin alone if Congress did not meddle with him. He now says he can do it better in gold *and* silver; but he has promulgated an entirely new definition of resumption. He says there are $348,618,000 legal-tender notes outstanding, and, of course, presentable, but not likely to be presented, on the first of next January. To meet these he has or is likely to have, in round numbers, $62,000,000 in gold and about $9,000,000 in silver, or $71,000,000. Being asked whether this was enough, he said no; that he could not resume with this, unless he used the power, which he believes he possesses, to reissue, or, in other words, keep afloat, $300,000,000; and this power, he calmly announced, he meant to exercise. So that what he means by "resumption" is that about $25,000,000 of greenbacks being always on deposit with the Treasurer for the redemption of bank-bills, and about $20,000,000 more being likely to be withdrawn before January 1 by fresh issues of bank-bills, he would deal with the remaining $300,000,000 by paying them on presentation, and then promptly reissuing them. In other words, he proposes to make three hundred millions of Government notes a permanent part of our circulation, and to add to this all the gold and silver that are put afloat.

It is true he thinks he will be able to pay these $300,000,000 whenever they are presented, and they will therefore not, strictly speaking, possess the character of inconvertible paper; but there are, nevertheless, these serious and, indeed, fatal objections to his plan: It will be the imposition on the Government of the issue of paper money, or, in other words, of the functions of a national bank, as a permanent and normal duty, without any real authority of law, and by what it is not too strong language to call a trick or perversion of law on the part of an executive officer. It will keep in the arena of national politics and within the reach of Congress one of the most dangerous questions of our time, and the one which has done most to bring about the widespread financial disaster from which we are suffering—viz., the question whether the legislature has not the power to alter the standard of value, or even to issue money of no intrinsic value. Finally, it will furnish a constant incentive to high-handed attempts at inflation. The $300,000,000 notes will be regarded by the ignorant as the "poor man's money," as distinguished from coin and bank-bills, or "rich man's money," and the pressure on the Government from the growing communistic element in the population to procure fresh issues of them whenever the times were hard, would convert our politics into a simple, constant struggle to save property from confiscation and the machinery of exchange from total derangement.

There is one merit in Mr. Sherman's talk with the Committee. Its evasiveness and vagueness, and the dexterity of its concessions to all schools of finance, will undoubtedly go a good way to quiet the extreme silver-men, and cause the Treasury to be let alone between now and next January; and that this is a gain we do not deny. But it is none the less true that were the President a financier the conversation would fill him with genuine alarm.

OUR DIPLOMATISTS.

MR. HEWITT'S sharp comments on our diplomatic establishment, and his sweeping proposal that our ministers in Europe should be cut down to two, and the places of the others taken by consuls, coupled with the recent appointment of Mr. Taylor to the German mission, have revived a discussion which has raged with short intermissions since the foundation of the Government, and which is apparently likely to last for another century. We have less diplomatic work to do than any other Power in the world, and yet no other Power has nearly as much trouble about its diplomatic machinery. The machinery is a copy, and in many ways a very absurd one, of that of European states, and were our foreign relations as complicated and as important as theirs it would probably have been remodelled or swept away long ago, just as the militia was remodelled and the elective officers swept away in the late war. Its defects have been largely concealed by the fact that the questions between us and foreign states which call for diplomatic treatment are few in number and for the most part trivial. When a really serious one arises our practice has been to put it into the hands of exceptionally able men who do not belong to the diplomatic calling in the strict sense of the term. The success of this plan has been very great, and has thrown a kind of glamour over our diplomatic system. We have, too, as a general rule, carried our point in disputing with European Powers; but this has been due in the main to agencies but slightly connected with the quality of our negotiators. In the first place, almost all our foreign controversies have arisen out of affairs on this continent, which are of comparatively small interest or importance to European governments, and about which they therefore defend themselves feebly—very feebly in contrast with American vigor and pertinacity. They are generally ready to yield or compromise about them, as troublesome rather than grave things. This weakness of theirs, too, is aggravated by the fact that while our powers of offence or annoyance in war would be very great, we are practically harder to get at than any civilized state. We cannot be invaded, and our ports are three thousand miles distant from every government which would dream of molesting them. Americans have, ever since 1812, enjoyed a reputation, which the late war has greatly increased, for extraordinary ingenuity in being unpleasant to their enemies—for, in short, an originality in hostility which no Power cares to test. Finally, American abstinence from interference in European affairs deprives us of all weight in the calculations of European statesmen touching the more serious and pressing problems of their foreign policy. They have constantly to consider what almost every other civilized Power will think or do under such and such circumstances; but they hardly ever have to consider what the United States will say or do, and they are thankful for it, and, as a general rule, are not desirous that we should change our practice.

These things, and others which we have not space to mention, really make our diplomacy a good deal of a simulacrum. Our ministers play somewhat the part of the Swiss Guard at the Vatican. They may be armed, and tall, and brave, and well drilled; but everybody knows, and they know, that they will never have to attack anybody or defend anybody; that if there was a riot it would be suppressed by the police with clubs. Among European diplomats the American minister is not looked on as belonging, strictly speaking, to the corps. *They* are a professional body, with rules of promotion and of pay, and of fixity of tenure, like the army or navy, while he is an amateur, who has taken the business up for a short period as a sort of holiday, and he has none of the advantages of a professional position. The estimation in which he is held depends entirely on his personal qualities. Wherever he goes he has to make his own position, while all his colleagues have been long known in the diplomatic body, and have reached a mission or an embassy after long service in subordinate places. He is, therefore, very likely to be recalled before anybody begins to mind very much what he says or care when he goes. If, therefore, he had real diplomatic work to do; if he had to keep a genuine watch on his country's foreign relations, and her safety or welfare were really dependent on his influence or perspicacity, the system would, of course, have broken down utterly long ago. The country would never have allowed the politicians to use it as it has been used, as a reward for successful stump-speaking, or as a compensation for the loss of a seat in Congress, or for a heavy contribution to a campaign fund, any more than in actual war they would allow the army and navy to be commanded by successful musicians or skilful whist-players.

Our diplomatists having for the most part no serious duties, we have fallen not unnaturally into the way of looking at them as social representatives of the country in foreign capitals—that is, as persons whose principal business it is to give foreigners a fair idea of what we consider our best society. The difference between the United States and foreign governments here is that what to these is simply a means is to us an end. They make their minister at a foreign court a great "swell," with polished manners, a good house, and a large salary, and tried capacity for entertaining, in order to increase his influence with the governing class of the country to which he is accredited. We do the same thing, though in a minor degree, not for its effect on our foreign relations—for nobody really expects it to have any—but in order to show Europeans that we can turn out fine ladies and gentlemen too, if we please. As long as this function of social representation is the principal one of American diplomatists, and as long as American diplomatists have to rely for their weight and consideration at foreign courts on their position at home before they took to diplomacy, or, in other words, on their personal qualities, the bestowal of missions on men of literary distinction will, *pace* Mr. Hewitt, be as wise a thing as the Government can do. The appointments of such men as Mr. Marsh, Mr. Bancroft, Mr. Adams (who was neither a "practical politician" nor a lawyer), Mr. Lowell, and Mr. Taylor are the most creditable on the whole, and under existing circumstances, which it can make. Mr. Adams, who, although he had been in public life, was more "a scholar and a gentleman" than anything else, yet stood with complete success the severest business test to which the foreign minister of any power has been subjected for half a century. The others certainly give foreigners a far better opinion of American society than ap-

pointments made under the ordinary political usages would be likely to give, and have in virtue of their reputation at home a consideration as soon as they arrive which an obscure or unknown man, in the absence of professional status, would take a long time to acquire.

It has to be borne in mind, too, that even in the most democratic countries of Europe—France, for instance—practical politics are not yet divorced from mental culture. The men whom the French peasants, with all their passion for equality, are most eager to put in office are the most cultivated men in the nation. It is not uncommon either there or in England or Germany for prominent politicians to be men of high attainments in literature and science. Here, on the contrary, the very idea of a practical politician having anything to say worth listening to about literary, scientific, or historical matters excites a smile. An article or book by Conkling or Blaine or Hendricks or Voorhees on anything but "the machine" or "Hell" would be treated as a dull comedy. The politicians, on their side, repay this contempt of the public for their intellectual accomplishments by treating literary culture as a positive disqualification for participation in public affairs, and take it for granted that a literary man, or a man of literary tastes, whether a producer or not, will be sure to fail in any executive capacity. In Europe this is considered a barbarian's notion. The fact that a man has distinguished himself in any civilized art raises the presumption, only to be rebutted by experiment, that he will succeed in others; and such a man gets an earlier and more careful hearing and creates a better impression about his country than any obscure lawyer, politician, or merchant could do. In fact, if Mr. Hewitt's suggestion, which should include a thorough reform of the consular service, be not adopted, the very best change to make would be the exclusion from all the higher diplomatic posts of all persons who had made no reputation outside the United States. This would, of course, indicate that we "cared for abroad" a good deal; but the diplomatic service, as now organized, shows that we "care for abroad," but do not know how to show it properly. The use to the people of the United States of paying an unknown American lawyer or merchant—ignorant of the world, of foreign languages, of literature, science, and art, dumb and ill at ease in all the social circles in which he finds himself, and thoroughly conversant with nothing but "the mechanism of government" in his own country—for lounging in a foreign capital, is something which nobody has explained or ever will explain.

DU CAMP'S 'CONVULSIONS OF PARIS.'

PARIS, March 8, 1878.

M. MAXIME DU CAMP is one of those men whom the French call "originals." He was born with a good fortune, and spent many years of his youth in long travels in Egypt and elsewhere. He wrote a few novels, which are now deservedly forgotten, such as 'L'Homme au bracelet d'argent.' He thought himself a man of imagination, and in that capacity he joined Garibaldi in the famous expedition of the "Mille" in Sicily, and entered Naples triumphantly on the staff of the famous hero of the red shirt. But the Italian hero did not much appreciate his French aide-de-camp, who came back to France and wrote an account of his expedition. Maxime du Camp suffered a sort of transformation after it; he suddenly became, from a man of imagination, a man of numbers, of statistics, an economist. He began to collect materials with as much care as a member of some "social congress." Taking Paris for the subject of his study, he published a work under the somewhat extraordinary title of 'Paris, its Organs, its Functions, its Life in the second half of the Eighteenth Century.' In six big volumes he described what may be called the anatomy of the capital of France, and there is no doubt that this work, while it now possesses great interest for all the administrators of great cities, will hereafter be a very curious historical document.

Since the war Maxime du Camp has published in the *Revue des Deux Mondes* a series of articles on the Commune, and he has now republished a part of them under the singular title 'The Convulsions of Paris.' After having described Paris in its normal state, such as it appears to the eye in regular times, M. du Camp has had occasion to see it in what he calls a "convulsion"; he has proceeded like the physiologist who studies an organ first in its normal condition, then in pathological states. Before the Commune, during the Commune, was it not always the same Paris, the same million-headed hydra? The work of years, of centuries, can be almost undone in a few hours. I remember how different Paris was from itself even on the 7th of September, three days after the revolution which followed the capitulation of Sedan. The police had almost vanished; the various ministries were in the hands of the members of the so-called Government of National Defence, but the new ministers felt themselves strangers in the palaces which had been abandoned to them; there was no authority left; everybody could go in and out. Paris was arming, bands of men were seen on the boulevards with guns on their shoulders; the streets were already dirty and great heaps of rubbish were seen before every door. The railway stations were crowded to suffocation; the wine-shops were full of working-men, of soldiers, of *moblots*. Paris smelt of wine. Bands of men, women, and children were going to the Place de la Concorde, and left great crowns of "immortelles" before the gigantic statue of Strasbourg. The Hôtel de Ville, which had become the seat of the Government, was a pandemonium. General Trochu was meditating on his "plan" while the lawyers of the Government (almost all its members were lawyers) quarrelled among themselves, or addressed the deputations which came every half-hour and expressed the wishes of "the people." But Paris on the eve of the siege was nothing to Paris on the eve of the Commune, or to Paris after the Commune; there was a gradation of horrors which culminated in the terrible eight days' war in the streets from house to house, in the wholesale massacre of the hostages, in the murders in the prisons. Alas! this is all forgotten. If it were not for the ruins of a few palaces, who would remember the Commune? Paris is gay, it is as brilliant as in its most brilliant days; it adds to its illumination by gas every night the new electrical illumination; the Place de l'Opéra seems in the purple and vivid light of the new invention like some fantastic decoration. The long galleries and the high towers of the Exhibition Palace are filled with the treasures of the whole world. The ruins themselves, with the rosy tints left by the petroleum, softened and rounded by time, adorn the magnificent capital. Was not Rome sacked eight times, and Rome is still admirable.

Maxime du Camp's book produces a singular effect on the mind. We do not like to hear so much truth. Go to that great banker, who lives in a palace and who enjoys universal consideration, and whisper in his ear that some thirty years ago he was engaged in a very mean transaction, that he had much difficulty then in saving his honor and disentangling himself from the consequences of his error; he will not believe you. Tell the old general, covered with wounds, that on such a day, in such a year, in such an affair, he was not a hero, that he acted like a coward; he will not believe you. What can be more horrible to the sinner than the truth? And still "the truth shall save thee." Maxime du Camp has said nothing except what was founded on the most authentic documents; he has patiently consulted all the papers of the police, of the *mairies*, of the councils of war. "I have told nothing but the truth, but I have not told the whole truth. It is at times so particularly monstrous, it reveals such acts of ferocity, of debauchery, of horrible depravity, that in many cases I have been silent out of respect for myself and respect for my readers. All the menagerie of bad passions had broken its cage during the Commune. . . . It cannot be said that the Commune was hypocritical; it was very frank. It was like a prostitute without any shame." It cannot be said that such a work as 'The Convulsions of Paris' has any political character; it cannot be invoked against any particular form of government, as the Commune was in reality the absence of government, the absence of law, the absence of any constitutional, administrative, or judicial guarantees. It was the reign of brute force; still it shows how easily a small number of men can govern a great capital by terror and by corruption. We cannot, or at least we ought not, to forget that for two months force reigned supreme in Paris. The Commune had an artillery of more than a thousand guns; it had twenty legions, composed of 254 battalions; the army counted from 140,000 to 150,000 men; out of this number we may say that only 25,000 men really fought, but the others received their pay of one and a half francs a day, and they were in consequence real accomplices of the Commune. This number of 150,000, which represents the paid army of the Commune, is not much inferior to the number of the registered electors of Paris.

The time may come when some writer, in order to please or flatter the electors of Paris, will try to describe a theoretical Commune, to surround it with the halo of some socialist doctrine. I read very attentively at the time all the proclamations of the Commune, of the Committee of the National Guard, the articles of the official *Moniteur* of the Commune, and I confess that I could never arrive at any result as to the ideas and

principles which guided the leaders of this popular movement. I came to the conclusion that it was a physiological movement, the mere outburst of animal passions which were left unrestrained. There was no patriotism mixed up with it, as the Communist leaders showed themselves remarkably humble before the Prussian commanders ; they hated the "Versaillais" much more than the Germans, because the Versaillais were determined to shorten their orgies. The Communists professed to be Republicans, and tried to represent the Republic as threatened by the royalist Chamber of Versailles ; but they must have known that M. Thiers had no intention of establishing a monarchy. The most important Republican leaders were in Versailles, on the side of Thiers. Gambetta alone had gone to San Sebastian in Spain during the civil war, under pretext of ill-health.

Even now it is difficult, however, to say with any exactitude how much political considerations entered into the beginning of the Communist movement. Once begun, it outgrew the domain of politics ; it became a mere socialist agitation. Its heroes were of a two-fold kind—some were men without any culture, mere brutes ; the others were well-educated men who for some reason or other had been unable to make their way in the world—men in a state of revolt against society. More than half the members of the Commune were taken at random from what has been called in England the "residuum" ; but these men became the instruments of a few educated and corrupt individuals, such as Pascal Grousset and Raoul Rigault. This Raoul Rigault is thus described by Du Camp :

"He was a heavy boy, with uncouth hair and beard, solid shoulders, short legs ; near-sighted, with a firm eye, an impudent nose, a sensual mouth ; fond of good wine ; talking, screaming, gesticulating, snuffing tobacco between two phrases, astonishing the young men by his talk, almost famous in the Quartier des Écoles. Half-student, half-journalist, repeating as sublime truths the stupidities picked up in the *Ami du peuple* [the paper of Marat] and in the *Père Duchêne*, he seemed strong because he was rude, energetic because he was cruel, intelligent because he was an audacious talker. He was the chief of a small group which recognized but one master, the man whom they familiarly called "le sieur" Blanqui. Blanqui knew Rigault well, and said of him : 'As a man he is a mere boy, but he is a first-rate policeman.' It was true ; Rigault had the genius of the police, and if he had lived he would probably have become a formidable detective—as old poachers become the best game-keepers. He had studied all the agents of the prefecture of police ; he knew who belonged to the division "des mœurs," who to the division of "sûreté" ; to the "furnished apartments," to the "research brigade." He feared mostly those of the "contrôle," and he played tricks on the men of Lagrange, who was charged with the political service of the prefecture of police. His joy was to follow them, to make their acquaintance, to take them to some beer-shop, and to leave them completely drunk."

Rigault had made pupils, he had formed a sort of counter-police. He never spoke of liberty, of equality, of fraternity. Even during the Empire he said, "When we shall be masters, . . . when we shall be in power." After the 4th September he took the place of his pet enemy, Lagrange. The siege was a preparation for him. He spoke little of Bismarck, of the Germans. He spoke of Marat. He became furious at the sight of a church or a priest. He never said the "Rue Saint-Hyacinthe-Saint-Michel." He said "Hya-Michel." He did not believe in saints. On the 18th of March he entered the Prefecture of Police—his day had come. He made himself "procureur," that is, "public accuser," of the Commune. His dream was to imitate the Hébert of the first Revolution. The dream of the ferocious Ferré (who executed the hostages) was to imitate Rigault. Crime must have models, like virtue. Ferré, a miserable, sickly man, with ecstatic eyes, small, ridiculous, looked with envy and admiration on Rigault, who was robust, who drank copiously (the account of Rigault's table during the Commune amounted to about 200 francs a day). Ferré and Rigault are good types of the Commune. Ferré represents the "residuum," Rigault the outcast of society—the vain and lazy student who will not patiently make a career, and who prefers to prey upon society.

"It cannot be said," writes Maxime du Camp, "that Raoul Rigault and Ferré were the men of the Commune. The Commune had no men—it had spectres, phantoms lost in the clouds of the past, whom the instinct of imitation led to violence, and who could formulate no new idea. But they were the expression of the Commune. They represented its coarseness, its vanity, its cruelty, its ignorance, its debauchery. These two *cabotins* [*cabotin* is the word applied to a contemptible actor] did incalculable harm by inciting constantly the mass of dreamers to excessive measures."

How is it possible to give an account of a book like this book on the 'Convulsions of Paris'? The whole interest of it lies in its infinite details. Du Camp devotes this first volume to the prisons of Paris and to the prison-life during the terrible days which followed the 18th of March. The Circles of Dante cannot be more infernal than these prisons, to which the prisoners were taken arbitrarily, and where they enjoyed none of the prerogatives which attend a prisoner in all civilized countries. M. du Camp takes one prison after the other—the famous "Dépôt," near the Prefecture, where the Archbishop of Paris and M. Bonjean were first taken, the Maison de Justice, the Sainte-Lazare, the Sainte-Pélagie, the "Santé," Mazas, the Grande-Roquette. I have gone again through all the stations of Calvary. I can only advise a few to read this account of what the depravity of man can do when it is not only unbridled, but when it becomes the law itself. There are days in history when the murderer becomes the judge. The Commune was one of those evil days. The memory of it will never be lost. It will remain in history like a mark of infamy—one of those dates which continue to shine when all else has become vague and misty, like the date of St. Bartholomew, like the days of 1793.

Correspondence.

PRESIDENT ELIOT'S CONSISTENCY.

To the Editor of The Nation :

Sir : In your last issue a correspondent signing himself C. K., and writing from Ann Arbor, asserts that "a very interesting and suggestive change" has come over my mind on the subject of the method adopted by the University of Michigan in 1870 of admitting students, without examination, on certificates from the authorities of approved schools. His evidence of this change of opinion on my part is, that in the last number of the *North American Review* I have commended to the attention of American teachers the examinations conducted by the "Oxford and Cambridge Schools Examination Board," whereas in 1874 I expressed, in my annual report, my disbelief in the method adopted by the University of Michigan.

The unwary reader would naturally infer that there is a close resemblance between the Ann Arbor method and the Oxford and Cambridge method, so that it must be inconsistent to condemn the one and praise the other. Indeed, C. K. virtually affirms that the two systems are "identical in spirit and purpose, and almost identical in form." He even implies that the University of Michigan anticipated by three years the Universities of Oxford and Cambridge in the adoption of the policy of examining schools, and then admitting pupils of these schools to the University without examination. Now, the fact is, that the English method bears no resemblance whatever to the Michigan method, but, on the contrary, has a wholly different procedure and a diametrically opposite tendency.

The English Board conducts actual examinations, both written and oral, on specific subjects, through competent examiners of its own choice ; and retains absolute control of these examinations in every respect. It examines persons, not programmes ; pupils, not teachers ; and it takes no account of school testimonials or diplomas. The Board holds examinations of two sorts : 1, examinations of schools—that is, of the pupils of any school upon their school work ; 2, examinations of individuals for certificates which give exemption from the entrance or matriculation examinations of the colleges at Oxford and Cambridge, from the first examinations in the University course at Oxford and Cambridge, from the preliminary examinations of the College of Surgeons, the Institute of Architects, the Council of Medical Education, and the Incorporated Law Society, and from portions of the examinations prescribed for first appointments in the army, and for admission to the Military Academy at Woolwich. The examinations of schools are held at the schools, upon request of the school desiring to be examined, and exclusively for its benefit and at its expense ; and these examinations have, in themselves, no effect whatever to admit pupils of the examined schools to the Universities, either with or without testimonials or diplomas given by the schools. The examinations of individuals for the Board's certificates cover all the subjects included in the various examinations from which the certificates give exemption ; they are conducted simultaneously at numerous places in England with the precision, fairness, and publicity which characterize all the English university examinations ; every candidate must pay, at least two months in advance, a fee of £2 ; the papers set are annually published, as are also the names of all the persons who receive certificates, with the subjects in which they respectively passed and the schools from which they came. [See the "Regulations of the Oxford and Cambridge Schools Examination Board for the year 1878.

Price 6*d*." The Annual Report of the Board (the first in 1874). The Annual List of Candidates who obtained certificates (the first in July, 1874). Price 6*d*. The "Papers set in the Examination for Certificates, July, 1876. Price 1*s*." These publications can be obtained through Macmillan & Co, New York City.]

In sharp contrast with this admirable system is the method of the University of Michigan as described in its official publications:

"A committee of the faculty will visit, once a year, any public high-school in Michigan, on request of its School Board, and report its condition to the Faculty. If the Faculty shall be satisfied, from such report, that the school is taught by competent instructors, and is furnishing a good preparation for any one or more of our regular courses, then the graduates from such preparatory course or courses will be admitted to the freshman class of the University without examination. . . . "—*Catalogue for* 1876-77, p. 36.

The President of the University, in his report for the year ending June 30, 1876, p. 6, speaks of this method as "the plan of receiving students from certain approved high-schools on diploma and without examination by us." The Oxford and Cambridge system is, on the one hand, an emphatic assertion, and, on the other, a striking recognition, of the supremacy of the universities over the institutions of secondary education; the Michigan method is a partial surrender of the authority of the university. The one is a strict, precise, and comprehensive system of publicly examining individuals in specified subjects; the other a lax, equivocal method of visiting schools once a year. The natural tendency of the one is to hold the secondary institutions up, of the other to let the university down. The two plans are so utterly different that it is hard to imagine how any one could approve both. He who admires the one must almost necessarily disapprove the other.

I am obliged to your correspondent for procuring for me, through your courtesy, this opportunity of again expressing my opinion—an opinion which time has only strengthened—that the Michigan method is an innovation of injurious tendency, and of again inviting public attention to the service which the two great English universities are rendering to English education through the action of their combined "Schools Examination Board."

Your obedient servant, CHARLES W. ELIOT.

CAMBRIDGE, MASS., March 25, 1878.

THE FINANCIAL FUTURE.

TO THE EDITOR OF THE NATION:

SIR: Silver dollars having now become an unlimited legal tender, it will be interesting to consider the probable results. To simplify the question, let us assume that the Resumption Act will not be repealed, and that silver certificates, if issued at all by the Treasury, will be issued only in exchange for actual deposits of coined dollars, with perhaps a margin of credit similar to that now provided for in the issue of gold certificates.

(1) At present there are practically no silver dollars in circulation, excepting trade-dollars, which are not a legal tender, and some few very old or very new coins, which need not be taken into account. As specie payments are not yet authorized, the Secretary of the Treasury has no right to pay out silver dollars in exchange for greenbacks. To pay them out for the purchase of silver bullion would be unwise and unwarrantable: first, because a gold dollar, which will now pay no more debt than a silver dollar, will purchase one-tenth more silver bullion than the latter; and, secondly, because the silver dollars so paid out would at once return to the Treasury through the Custom-House, thereby diminishing to that extent the revenue of the Government, and its ability to continue the payment of interest on its bonds in gold. Apparently, therefore, the only proper course for the Secretary of the Treasury to pursue is to hoard the silver dollars in the Treasury as fast as they are coined.

(2) On the first of January, 1879, greenbacks will be payable in coin, and by that time there will probably be, say, $30,000,000 of silver dollars available for their redemption. Of course, from that date all who have duties to pay at the Custom-House will obtain the coin for that purpose at par, in exchange for greenbacks; and as it is not likely that the balance of trade will turn against us so rapidly as to allow these silver dollars to be exported without loss, they will probably, for some months at least, continue to accumulate in the principal centres of trade, being too cumbrous for general circulation. Even the banks will not want to be encumbered with them, but will prefer to keep them on deposit in the Treasury, using greenbacks and silver certificates in their place.

(3) We shall thus have in circulation at least four different kinds of money, so-called, viz.: silver, silver certificates, greenbacks, and national bank notes, besides subsidiary silver coin. Gold will continue to be used as merchandise for purposes of export, but with an increased premium, and as all gold revenue will cease before many months, both the principal and interest of bonds must be paid in silver. So long as the balance of trade does not call for the export of silver coin, the above four kinds of money must apparently continue to circulate side by side, with continually increasing volume, until their depreciation becomes so great as to call for the export of silver coin. Any considerable advance or upward tendency in the price of silver bullion would, of course, hasten this result; but sooner or later it must come, and the longer it is delayed the more dangerous it will be.

(4) In the meantime it certainly seems probable that a period of inflation is close at hand. With our peculiar financial organization, and the sanguine and speculative temperament of our people, this continued plethora of circulating medium, especially when rendered apparently safe by the resumption of specie payments, must inevitably produce its usual effects. We must remember, however, that there has been as yet no real adjustment of the currency, no real equilibrium established between coin and paper; and if there is any virtue in statistics, and any wisdom to be drawn from past experience, the amount of paper money now in circulation is far beyond what can be maintained at par with specie under the pressure of an adverse balance of trade. How much more will this be the case when it is swelled by the issue of silver certificates and by the increase of bank credit which is sure to follow!

Perhaps, therefore, the best thing that can happen for us, though by no means the most agreeable, is that gold should rise gradually to a premium of ten per cent., and be carried off to Europe, that our bonds should be steadily returned upon our hands, thus absorbing our idle capital, and that our people, still so much impoverished by past extravagance, should be kept at work earning and saving money, and liquidating their foreign and domestic debts, without an opportunity of renewing the brilliant career of folly and waste which followed upon the close of the war. In that case, specie payment, at least in silver, may be not only resumed, but maintained, and the reign of irredeemable paper be ended, let us hope, for ever. J. S. R.

[The danger is, however, that silver not having brought back the happy days, the pressure for "fiat-money" would become stronger than ever. Experience has shown that all attempts to satisfy popular delusions in financial legislation have never ceased till the bottom was reached—that is, until the *reductio ad absurdum* had been performed, so that the most ignorant man in the community could understand it—until, for example, it took $100 or $1,000 to buy a quart of peanuts. Salvation through irredeemable paper money or any other kind of inflation is possible and has been achieved only where, as now in France, the management of the currency has been left in skilled hands. If the French people had taken hold of the financial problem after 1870, under the pressure of their burdens, and every voter had converted himself into a minister of finance, the bottom would have dropped out of French credit long ago. Our chance of escape lies in the possibility of rescuing our currency from the demagogues before the conservative and patriotic spirit which the war infused into our finance has been exhausted, and the final rush for the bridge begins. What we have to fear is the disgust which will be excited when it is discovered that silver, like gold, is "rich man's money"—that is, can only be procured for labor or goods. If this should not be guarded against, specie payments would not be maintained in silver any more than in gold.—ED. NATION.]

ACCEPTING THE SITUATION.

TO THE EDITOR OF THE NATION:

SIR: I am the editor of a newspaper not "prominent" outside the State in which it is published. In its columns I have earnestly opposed all legislation intended to give us any other than a gold standard for our currency, not with the expectation that I could thereby exert influence at Washington, but with a view to preserving a sound public sentiment among the constituents of the Senator and Representative from this State who have firmly opposed all such legislation; yet, now that the deed is done, I feel some disposition to acquiesce and make the best of a bad busi-

ness, which disposition your article in the last *Nation* does not entirely remove.

The case appears to me thus: The original Bland Bill proposed to give, at once, a new meaning to the word "dollar," and thereby alter and impair every contract made before that date requiring the payment of "dollars." Its certain effect would have been to give to this country a single currency of silver, while the object of the bill—which was to enable public and private debtors to escape legally the payment of from eight to ten per cent. of their debts—was one of undisguised dishonesty. The Senate amendments only postponed the time when these necessary results would ensue, and made the descent a gradual instead of an abrupt one. The passage of the bill in either form made of this a rascal nation, naturally and properly injured our credit, and imposed on this and the next succeeding generation the burden of interest-payments one-third larger than we need have borne, for the sake of enabling some generation yet unborn to escape the payment of one-tenth of the principal of a debt the interest on which, at six per cent., will amount to more than its principal long before such final payment.

Yet, as one of the forty millions of rascals created by this act, I feel that there is a necessity that we shall still live, if for no better reason than that we may repent, and I am therefore disposed to accept the new definition of the word "dollar," and adapt business to the new basis, and also to try to prevent a still lower descent in the scale by opposing paper inflation. It will not take the world long to comprehend that the value expressed by the word "dollar," in the United States, is that measured by the silver five-franc piece, and such foreign trade as we have will be conducted on that basis. Whatever may be finally the purchasing power of that quantity of silver will be the purchasing power of the American dollar. No one claims, I believe, that it will not have some intrinsic value always. Is it not, then, the part of wisdom and prudence to join hands now with those of the silver advocates whom we believe honest but mistaken, in defeating the ultimate purpose of a majority of the silver agitators—the making of the silver legislation but the entering wedge for paper-money inflation?

I write under the conviction that the realization of all the results threatened by the original Bland Bill is only a question of time under the operation of the bill as it passed the Senate. If I am mistaken in this, I am, of course, wrong in my conclusions, but I see no reason to hope that I am mistaken. Many leading New York papers have urged bankers and other business men to put their business on a gold basis, but a careful scanning of their news-columns fails to show me that any concerted movement in that direction has taken place or is likely to take place. If it is not done in New York, it will not be done anywhere. There appears to be a practical submission among business men such as you censure newspapers for giving in words; but if they acquiesce and adapt themselves to the situation, of what value will lamentation and warning by the newspapers be? I put these questions in all earnestness, for I am sure that if you can point out even a "fighting chance" to save the country from the effects of the Bland Bill, the papers which have consistently and intelligently opposed it will be glad enough to continue to attack it; but if those results are as inevitable as they appear to be to me, I can see no good that can come from further agitation of the subject, and much positive harm to business, which it is our duty to avert if we honestly can.

Yours respectfully, W. T. Croasdale.

Wilmington, Del., March 18, 1878.

[If we knew exactly what Mr. Croasdale meant by "joining hands" with the honest portion of the silver agitators, we could better answer his questions. Our counsel to preachers is to preach the value of a stable standard of value, and try to get dealers in money and merchandise to help the preaching by using in their contracts the most stable standard known. There is to this, of course, the usual objection to all preaching—that it will produce no effect at all, or none for a very long time. But what other way is there, in our state of society, of meeting a widespread popular delusion on any subject? The extreme silver-men cannot be stopped or discouraged by agreeing or pretending to agree with them. On the contrary, every concession tempts them into fresh excesses. We believe their leading man, Senator Jones, who was a stanch opponent of paper inflation in 1875, is now in favor of "fiat-money"—that is, money composed of some worthless material, with a Government stamp on it. What these men are driving at is undoubtedly the repudiation of all debts, public and private, by the total breakdown of the currency, so that the country may "make a fresh start," free from all liabilities. It is a great mistake, to our mind, to suppose that agreeing to go part of the way with them, or pretending to think that their schemes ought to have a fair trial, will divert them in the least from their ultimate design. Nor is there any way under heaven of foiling them except by appealing to the honor and intelligence of the American people, through the press and the platform. It may be that the crisis is such that even this resource will fail us. But as long as there is even a hope of success we are bound to try it. If by "joining hands" or remaining silent we can raise the price of silver, by all means let us do it. But our correspondent does not suppose that silver would rise one penny per ounce because all the newspapers praised silver as currency, or that anybody fit to conduct business would use one cent more of it in his business, in order to give the Bland Bill a fair trial. We must all rid our heads of the notion that this matter is any longer within the reach of sentiment of any kind, or that the men who are now fixing the price of bullion are moved by dithyrambs about the "fathers' dollar" or Abraham's shekels. They dispose of whole yards of Cincinnati and Chicago rhetoric by a few figures on a broker's little pad.—Ed. Nation.]

Notes.

A VERY competent artist, Mr. S. A. Schoff, of Newtonville, Mass., proposes to make a line engraving from the crayon portrait of Emerson by Rowse. This portrait is not only one of Rowse's best works, but by far the finest of Mr. Emerson, and one of which the poet Clough wrote in 1859: "It is really, I think, without any question, the best portrait of any living and known-to-me man that I have ever seen." There will be five hundred artist proofs, and no more, at ten dollars each, and the work will be begun as soon as one hundred names are obtained. A year will be required for its completion. Subscriptions may be sent to Doll & Richards, 2 Park Street, Boston.——Prof. W. S. Tyler's article in the March *New Englander* on "The Teaching of Christ respecting the Duration of Future Punishment" is to be republished by A. D. F. Randolph & Co.——The Religious Newspaper Agency, 21 Barclay Street, will shortly issue 'The Complete Preacher,' a volume of thirty-two sermons by German, English, French, and American preachers of note.——Sheldon & Co. have in press a story of army life in America by Custer's biographer, Capt. Frederick Whittaker.——R. Worthington, 750 Broadway, has bought out the stock, plates, etc., of Lovell, Adam, Wesson & Co., Lovell Printing and Publishing Co., and Warwick & Co., and henceforth adds their publications to his lists.——Mr. Lawrence Buckley Thomas, 54 McCulloh Street, Baltimore, author of 'Genealogical Notes on the Thomas Family of Maryland,' has abandoned his intention of printing an elaborate supplement to this work, and adopts the novel plan of issuing a supplement of corrections and additions, with autographic fac-similes, by the papyrograph process. One hundred copies need to be subscribed for, at $1 10 each, postage included.——We have to record the untimely death last week of Prof. Charles Frederick Hartt, of Cornell University, in charge of the Brazilian Geological Survey. He was a native of Fredericton, N. B., where he was born in 1840; but his geological tastes were first exhibited in Nova Scotia. He became in 1862–65 a student under Agassiz, and accompanied him in his expedition to Brazil as first assistant-geologist. This determined his future connection with the Empire. His subsequent observations in the Amazon valley led him to differ from Agassiz as to the evidence of glacial action in that region. Prof. Hartt was also an ardent student of the Indian languages, and made a folk-lore collection of no little value. His work on the 'Geology and Physical Geography of Brazil' appeared in 1870. He died at Rio of yellow fever.——A chronological list of the books illustrated by Cruikshank is given in the London *Bookseller* of March 2. Descriptive notes of much interest are added in each case. In 1859 Cruikshank designed a frontispiece to Hotten's edition of the 'Biglow Papers'; in 1853 he illustrated 'Uncle Tom's Cabin' for English, French, and Welsh editions, of which the last is said to have a large sale still.——The November-December number of the *Library Journal*, belated for good reasons, contains the papers read at the English Library Conference. The proceedings will follow in the next number. Most striking among these papers is Mr. Henry Stevens's irreproachable plan of photo-bibliography, illustrated by

fac-similes of several curious title-pages. This idea deserves to bear fruit.——We correctly stated last week Governor Prescott's majority in New Hampshire, but, in comparing the total vote of 1877 and 1873, mistook some partial returns for complete ones, and so reported a falling off of sixteen thousand. In fact, it was less than a hundred.

—The second of the new series of Harvard College Library bulletins is even better than the first. Dr. Lodge concludes his note on American history. Mr. Winsor makes one on Puritans and Separatists, which will serve as a preface to Dr. Lodge's. Prof. Dunbar contributes a bibliographical sketch, of present interest, on gold and silver. Dr. Abbot comments on Martini's 'Pugio fidei adversus Judæos,' and the 'Hierobotanicon' of Olof Celsius, and pours forth a wealth of references apropos of Canon Farrar's 'Eternal Hope.' The longest note, however, is Dr. Emerton's "Authorities for the History of the Empire and the Papacy, 1056–1122," to which he has added a short but good list of books which would be of service to beginners in German. The last two articles, "Rarities of the Sumner Collection" (A–Autographs) and list of the principal books relating to the life and works of Michelangelo, with long and valuable and interesting notes by Mr. Norton, will be continued in future numbers—many future numbers we hope—and when finished will be issued separately in a small edition. We have also before us the Catalogue of the Public Library of the City of Taunton, Mass., a collection of 1,200 numbers made in the past dozen years, and so exclusively English that we have in a cursory examination found but three works in as many modern foreign languages; and though it contains a 'Dictionary of the Chinook Jargon,' it has neither a French, a German, a Spanish, nor an Italian dictionary. The catalogue is further distinguished by being printed on Manila paper, after the latest library economy, and the effect on the eye is not unpleasant. As a substitute for cross-references there is a classified index in addition to the authors' catalogue.
